The statistics of the production of anthracite and bituminous coal in Pennsylvania for 1897 furnished by the State Bureau of Mines show that the production of anthracite decreased over 1,000,000 tons in 1897 as compared with 1896, and the production of bituminous coal increased nearly 4,500,000 tons within the same period. The production of anthracite was not less than that of the previous year; the total amount produced was less than the output of bituminous coal. The number of persons employed in mining anthracite was larger than the number employed in mining bituminous coal. This means, of course, that the amount of coal mined for each person employed was far less in the mining of anthracite than in the mining of bituminous coal. The number of accidents, fatal and otherwise, was very much larger in mining anthracite than in mining bituminous coal. The following table, compiled from data furnished by the State mine inspectors, is interesting:

	Anthracite. Long tons.	*Bituminous Short tons.*
Tons of coal mined	46,947,354	54,671,452
Tons of coke made	.....	8,533,291
Persons employed	149,557	88,554
Coal mined per employe.	314	617
Coal mined per miner	490	744
Fatal accidents	424	149
Non-fatal accidents	1,106	426
Life lost per 1000 emplo'es	2.83	1.86
Acci'ts per 1000 employes	7.39	4.81
Production per life lost	110,725	366,942
Production per non-fatal accident	42,448	128,344

There are a number of reasons why anthracite mining is the more hazardous. The mines are deeper and blasting with high explosives is more necessary; more machinery is employed in preparing the coal for market, and this, of course, increases the liability of accident. On the other hand, anthracite mines are free from the great source of anxiety and danger to overseers and miners, the formation of fire-damp or explosive gases, except under very unusual conditions.

Books Received.

"*Tutorial Chemistry — Metals;*" by Profs. Bailey and Briggs, 8vo., 300 pp., a companion book to those of the series already noted and of the same degree of excellence, of high character and adapted to college or field use. Hinds & Noble, 4 Cooper Institute, New York City; $1.

"*The Calorific Power of Fuels;*" discussed from a scientific and practical standpoint, with tables of heats and combustions of fuels, solid, liquid and gaseous, tables of constants, etc., an exhaustive discussion of calorimetry, a high-class reference book; 8vo., 40 illustrations, 279 pp. Jno. Wiley & Sons, New York City; $3.

THE seventh edition of the "Pelton Water Wheel," 1898, is out, an up-to-date account of what this wheel does, and a compendium of modern hydraulic literature of value to any one interested in this subject. It will be sent upon request. Address 121 Main street, San Francisco, or 143 Liberty street, New York City. A feature of this 100-page book is a list on pages 50–51 of 140 electric-power installations of this wheel, and on subsequent pages another fine list of about 1000 different companies who have ordered Pelton wheels.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 22, 1898.

601,123.—AWL—N. D. Chase, Pokegama, Cal.

601,014.—STARTING GATE—P. A. Finigan, S. F.

601,135.—THAWING MACHINE—H. K. Greenleaf, Portland, Or.

601,097.—MAGAZINE FIREARM—J. Harle, Vancouver, Wash.

601,002.—HANK FOR SAILS.—J. S. Jennings, S. F.

601,039.—LINEWAY—M. F. Kohinka, Scotia, Cal.

601,212.—GOLD EXTRACTOR—S. P. Moody, Magalia, Cal.

600,926.—SULPHURING CASKS—P. J. Nicolini, Oakland, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOLDING COT-BED.—H. C. Niemeyer, Wheatland, Cal. No. 600,647. Dated March 15, 1898. This invention relates to an improved construction of cot-beds whereby when extended they are given all the rigidity of a solid structure, but are capable of dismounting and folding into small compass for transportation. It consists essentially of main side bars, extensions hinged in line therewith adapted to fold and unfold upon the main bars, having the abutting ends beveled, a flexible covering secured along the edges of the main bars and extension bars adapted to be detachably connected with the ends of the covering having mortises upon their ends to fit corresponding tenons upon the ends of the extension side bars, legs pivoted beneath the ends of the main portion adapted to fold and unfold about their pivot points, and jointed brace rods extending from the main side bars to the legs, so that the latter are braced longitudinally, and other braces between the legs at each end, with means for drawing the lower parts of the legs together to produce a transverse tension on the flexible covering and lock the cross-bars in place.

QUARTZ MILL.—H. H. Crain and J. W. Forbes, Plymouth, Amador Co., Cal. No. 600,635. Dated March 15, 1898. This invention relates to a mill which is especially designed for crushing quartz and other material. It consists of a mortar having an unyielding bed, weights with links by which the opposite ends are suspended, the bottom of said weights lying approximately parallel with the bed when suspended in the normal position, and means comprising a crank shaft and pinion extending therefrom to points near the centers of the weights, whereby they are alternately lifted above the surface of the bed and brought down upon it with a plunging movement, said links being flexibly jointed at points in their length, so as to permit of an independent movement of the weights when they strike the material below.

ANTI-FRICTIONAL HANK FOR SAILS.—J. S. Jennings, San Francisco, Cal. No. 601,002. Dated March 22, 1898.—This invention relates to an improvement in devices for the operation of sails of that class which are adapted to be raised and lowered upon a rope or stay, such as jibs, staysails and others of a like character. It consists of a device for detachably connecting sails with the stay upon which they are to be raised and lowered, this device comprising a two-part yoke, the lower end of which is made concave to fit the bolt rope upon the edge of the sail, lugs projecting upwardly through each half of the yoke, a bolt passing through the lugs and the sides of the yoke, so that this portion is united together and channels formed for the seizings by which the sails are attached to the yoke. The upper end of the yoke has a concaved roller journaled within it adapted to travel upon the stay, the journal-pin serving to unite the upper ends of the yoke together.

DEVICE FOR SULPHURING CASKS.—P. J. Nicolini, Oakland, Cal. No. 600,926. Dated March 22, 1898. This invention is designed to provide a means for purifying wine casks, hose and other conveyors which are employed in transferring wine from one receptacle to another, and also to prevent the deterioration of the wine within the cask or other receptacle when a portion has been withdrawn and the upper part of the receptacle contains air. This invention consists of a furnace chamber having a grate in the lower portion consisting of parallel bars standing on edge, so as to receive and vaporize the sulphur-impregnated strips which are ignited thereon, a plurality of screens of different mesh situated above the grate and adapted to arrest any ash or floating material, a propelling device connected with the side of the upper part of the case and a means for actuating the same, and a pipe connected therewith through which the fumes may be introduced into the cask. The sulphur-impregnated strips, being placed on edge between the parallel bars, are sustained in such a manner as to allow free ingress of air for the combustion to produce the sulphurous fumes and are kept out of contact with each other.

Commercial Paragraphs.

THE Weber Gas and Gasoline Engine Co., Kansas City, Mo., are building for the La Aurifera mine, Nuevo Leon, Mexico, a heavy single-drum hoisting engine to work 800 feet underground.

THE Arkansas Valley Smelting Company, located at Leadville, Colo., has placed an order with the Colorado Iron Works Company of Denver, Colo., for one carload of water jackets.

Cost Accounts.

One of the most important branches of the accounts of a manufacturing establishment is that by means of which the actual cost of the manufactured article is ascertained. In flush times, when orders are plenty and prices good, the cost accounts are often neglected, and the result is that when hard times come it is found necessary to investigate the methods of finding out the cost of the product, and sometimes the result is anything but satisfactory.

The cost of an article is too often a very indefinite quantity, and its relation to selling price is sometimes still more uncertain. Ordinarily the cost of a manufactured article consists of three elements: material, labor, and general expense. These are usually supposed to cover the prime cost of the article, to which the cost of selling and the profit must be added.

Of these three elements the material can usually be determined quite closely enough for all practical purposes, but the labor and the general expense cannot always be so easily measured. When the labor cost is measured by time, that is, when the men are paid by the day or hour, the time can be kept, and, if carefully watched and distributed, a fairly close approximation is obtained. When the piece work sytem is used the cost of the labor is definitely determined, and one of the strongest arguments made for piece work is the simplification it makes in cost keeping.

The expense account is the greatest source of uncertainty in cost keeping accounts. It is usually not difficult to ascertain the proportion which the general expense bears to the total output of an establishment, but there is some difference of opinion as to the fairest method of distributing the burden. The usual plan is to consider the general expense as a percentage of the productive labor cost, and in most shops the two are taken as about equal; that is, the prime cost is composed of the material, the productive labor, and an allowance for expense equal to 10 0 per cent of the labor.

While this is a comparatively simple method of distributing the expense account, it is not always a fair or truthful one, as some articles which are really profitable are given too high a cost, while others are not high enough. If by any means the labor cost on a piece of work can be reduced, this method would cause a corresponding reduction in its proportion of expense burden, while as a matter of fact such a reduction in labor cost has really not affected the running expense of the shop at all.

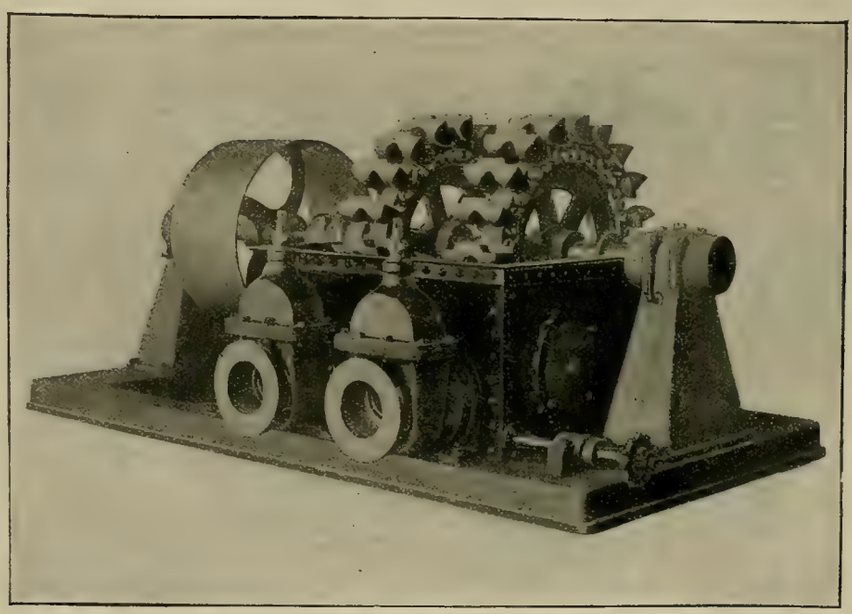
Thus, for instance, the introduction of certain automatic machines might readily enable one man to attend to two machines and turn out twice the product he formerly did. The result would be to halve the labor cost on the product. The expense burden, on the contrary, instead of being reduced, would be increased by the proper addition for interest and depreciation on the new machines, and could only be taken care of either by increasing the percentage charged on the labor cost, or by making the same expense charge carry twice as much output.

Some accountants maintain that the expense should be distributed as so much per man, rather than as a portion of a man's wages, and for some reasons this would result in a fairer distribution of expense than the latter method. Sometimes it is found that certain charges usually included in the general expense can with a little care be charged directly to the actual job to which they really belong. This is the case with drawing room expense and with numerous details of engineering work often lumped in with general expense merely to save detail in bookkeeping.

Again, the expense may be divided among tools, as well as men, and thus directed to especial jobs with a greater degree of precision. This is more readily done when a shop is full of work than at other times, as when tools are idle part of the time the expense still goes on and must be carried by the portion of the establishment which is working.

One of the natural results of the introduction of a really careful and intelligent system of cost accounts is the transfer of a portion of the general expense charges into specific charges against definite orders. It will be found that very many details of expense can really be placed where they properly belong, and the indefinite portion, about the distribution of which uncertainty must always exist, will be reduced to a minimum; and the cost accounts will then show much more nearly which articles are made at a profit, and which at a loss, than could otherwise be possible.

With the exception of such proprietary specialties as can be entirely controlled, the cost has only a secondary influence upon the selling price. Under the present commercial conditions selling price is fixed by competition, and one maker must usually meet the price set by his competitor. The knowledge of shop cost, however, will prevent the intelligent manufacturer from selling at a loss, or show him where he must economize in order to meet competition; and sometimes the dashing competitor who for the time fixes the market price himself keeps no trustworthy accounts, and acts only with the courage of his ignorance.



An Interesting Power Plant.

A striking example of the utilization of water power made possible by wheels of the impulse type is presented in the arrangements recently made for power in the textile goods factory of M. Benoist Cadet fils, La Bastide, a town south of Bordeaux in the Departpartment of Tarn, France. Here a steam engine, which formerly was used to furnish the power for the entire factory, is now held in reserve for periods of low water, and the greater part of the time power is furnished by a 36-inch impulse wheel, working under a head of 128 feet at 285 revolutions per minute and furnishing 40 H. P. The use of contracting nozzles makes a high efficiency possible with the varying loads.

The illustration herewith presented shows the wheel sent to La Bastide by Messrs. Powell & Colne, export agents, Bowling Green building, New York, which was furnished them by the American Impulse Wheel Company of 120 Liberty street, New York.

The photograph was taken with the top casing removed and the shape of buckets peculiar to this wheel can be observed. The high efficiency of these wheels is due to close attention and study which its engineers give to detail and to care exercised in manufacturing. A prime mover with so low a first cost, and almost negligible expense for repair and requiring little or no attention while running, is an attractive one to a large number of manufacturers who are at present burdened with heavy expenses in connection with their motive power.

The possibilities of the electrical transmission of energy are now so great that many concerns might at comparatively small expense utilize water powers, even though they were located at considerable distance from their respective establishments. The numerous inquiries on such subject which the American Impulse Wheel Company receive have the careful consideration of their engineers, and as full information is sent in reply as the data presented will permit.

THIRTY-SIX INCH TWIN IMPULSE WHEEL.

Oil in Steam Boilers.

One of the principal problems yet remaining unsolved in connection with the economical generation of steam is that of the use of condensed steam as feed for boilers without the injurious effects of the oil carried over from the lubrication of the engine in which the steam was used. There is a manifest economy in the condensation of steam, and much of the advantage gained by multiple expansion would be lost if the expansion could not be carried below the pressure of the atmosphere. Surface condensers are undoubtedly the best means of accomplishing this end, and the condensed steam makes an admirable feed water for the boiler, except when it contains such a quantity of oil as to cause deposits of non-conducting material upon furnace flues and firebox sheets. Even a thin film of grease upon the plates of a boiler furnace will keep the water out of contact with the metal, and many furnaces—both corrugated and plain—have gone down from this cause.

The extending use of sight-feed lubricators and the feeding of the oil into the steam is well known, and if we remember that all the lubricant which goes into the steam inlet must also go out with the exhaust into the condenser, and so back into the boiler, we must take into account the effect which this quantity of grease will have upon the boiler furnace plates, which are so dependent upon the protection of the water to prevent overheating.

Many of the great ocean liners, which must use the condensed steam in order to avoid filling the boilers with salt water, use filters to extract the grease from the water before it reaches the boilers at all. Various filtering mediums are used for this purpose. On some of the Sound steamers straw or hay is used, while in other instances cast-iron boxes tightly packed with sponges have been tried. On the White Star steamers the Edmiston filter is used, the oil in this case being extracted by diaphragms of woven filtering materials, compressed between perforated metallic plates, and this form of grease filter has been highly recommended. For land purposes, where space is not such an important consideration as at sea, both sand and coke have been used, and there is no doubt that by use of a sufficiently thick layer of such materials, and by frequent renewals, much of the grease from condensed steam may be removed and the water made fit for boiler feed purposes.

Where there is lime in the feed water the presence of oil in the boiler is especially objectionable, as a soft, spongy mass is formed, which collects upon crown sheets and flues, often with most disastrous results.

There are two points in this matter which, if observed, would enable much of the trouble to be avoided, and that, too, without involving recourse to any special appliances. In most instances far too much oil is fed into the steam, and the engines would work all right with very much less oil than is usually fed to the cylinders. A good quality of oil should be used, but the quantity fed should be made a minimum, not only for economy in first cost, but also for protection to the boilers. In nearly every case a most wasteful excess of oil exists, and there is loss at one end from excessive oil bills and at the other end from damaged boilers. In one well-known instance a careful engineer was using eight drops of oil to one revolution of the engines, and it was found that this could safely be reduced to one drop to eight revolutions without injury to the cylinders from insufficient lubrication.

Another point is to be noted in regard to the character of the lubricant. The high-grade cylinder oils are supposed to be made from mineral sources and to contain no animal matter. Now kerosene oil and its derivatives are found not to be injurious to steam boilers, but, on the contrary, are frequently introduced in order to loosen boiler scale and prevent its formation. The principal difficulty occurs with the small percentage of animal oil, which, in order to improve the lubricating qualities, is often mixed with cylinder oils. Animal oil should never be permitted to enter the boiler, and the lubricant used in condensing engines should be carefully examined, and the absence of animal oil assured. When this is done, and when, by close and careful experiment, the very least quantity of lubricant possible is used in the cylinders, the best precautions against injury to the boilers will have been taken.

WHEN the loading of a ship has been completed and the hatches have been put on, every precaution is taken to make them tight, so as to keep the cargo dry during the voyage. The hatches are in sections, which rest on frames laid across the hatchway. All the seams around the combings of the hatchway and between the sections of the hatch are calked and then pitched or painted, and the entire hatch is then covered with tarpaulins which are battened down at the sides. The ship may be months at sea; she may take over her bows solid water that will sweep aft, submerging her decks like a river, and she is likely to have more or less water on deck at any time; but none of it gets below. The ship's hatches are as impervious to water as her sides. On steamers when the hatches are put on they rest upon strips of rubber and they are secured by means of set screws, making the hatch tight in the same manner that a fruit jar is sealed.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: Another strike has been made in the Valparaiso mine 53 feet below the tunnel level.

The Golden Crown mine, near Drytown, struck a good streak 90 feet from the surface.

At the Pocahontas, near Drytown, they have finished cutting a station at the 600 level and began sinking again. The owners will sink 900 feet before driving a level or drift.

The Amador Queen No. 1 shaft is down 915 feet, and sinking is progressing favorably. The power drills are working well. Mr. Dye has started crosscutting east and west from the 500-foot level. Good rock has been encountered.

Ledger: Cleaning the south shaft at the Gwin mine is progressing rapidly. The old shaft is opened about 900 feet from the collar. The work of mining through the new shaft goes on steadily and the 40-stamp mill is grinding 150 tons of ore per day. Drifting and crosscutting at the 1200 level of the South Spring shaft is progressing. Ore is being encountered which is good, but so far has not come in quantities sufficient to justify the starting of the mill.

Amador *Republican*: The output of the Argonaut in February was between $56,000 and $57,000 in free gold and $9000 in sulphurets. The expenses are estimated at $15,000 a month.

The rock in the 2250 level of the Kennedy is said to mill $20 a ton.

The shaft at the Amelia has reached 500 feet. Sinking is continued and averages 15 feet a week.

The shaft at the Bellwether will be sunk 400 feet deeper.

At the Zella 150 tons of ore are crushed daily.

The Union Con. has reached 500 feet depth. The ledge runs from 5 to 40 feet in width and though low grade, has enough rich spots to make it pay.

At the Oneida crosscutting in the 1500 level is in progress. It is believed this mine will have a large mill in operation before the end of the year.

The Amador Queen No. 1 reached a depth of 915 feet. Crosscutting is in progress.

Milling ore is being produced from the 600 level of the South Eureka.

At the Central Eureka the shaft has reached 1000 feet. At the 600 level drifting is progressing in a large ledge of low grade ore. A drift has also been started in the 900 level. It is likely that a 40-stamp mill will be erected in the fall.

The Wildman-Mahoney, though low grade, is paying from $8000 to $15,000 in monthly dividends.

Work has started in the Lincoln mine.

The Columbia has struck pay ore on the 250 level.

The lien holders against the Bay State have settled their claims for 75 cents on the dollar. It is reported that the new company will begin work at once.

D. Boyson will reopen the Pioneer mine.

Butte.

Smith & Butler have opened up the old Alder Spring mine, near Nimshew, and are taking out paying gravel.

The Kappa gravel mine, between the Magalia and the Petewood, to be worked on a large scale by an English company, contains 1600 acres.

The tunnel on the Crystal Hill mine, near Enterprise, is in nearly 400 feet.

At the Gold Bank 100 men are employed. It is reported that a good ore body has been struck at the Golden Queen mine.

The Carlisle mine, near Forbestown, has a ledge averaging 8 feet. The shaft is 150 feet, from which a drift runs on the ledge 100 feet. The erection of a cyanide plant is contemplated. The property is owned by Mrs. E. Clark of Woodland.

At the Denver mine chlorination works are to be erected. There are seventy-five tons of sulphurets on hand, and a ton per day is added. The lowest tunnel is 900 feet below the apex.

The Bank of England Con. Co. has reached 200 feet. This is the tunnel which it has been stated would be driven into the hill a long distance to cut a number of properties.

Calaveras.

The treasurer's report of the Ford mine, at San Andreas, for 1897, shows receipts $27,500.20; disbursements, $26,458.73; balance on hand March 1st, 1898, $2,565.07.

The Round Butte M. Co., Sheep Ranch, reports good prospects. They are using 150 inches of water night and day. Bush & Pache report good prospects at the Bunties Gulch hydraulic mine.

The *Citizen* says it is stated that C. D. Lane will develop the Illinois mine at once. A shaft 135 feet is in good order and sufficient ore is in sight to warrant the erection of a mill.

The Gladiator mine, half a mile from Blue Lakes City, is producing good ore. The mine is owned by C. Kelton.

The *Chronicle* says that the Boucher & Brackett gravel claim in Chili gulch has been sold to J. E. Burton for $7000. Mr. Burton will at once commence work.

The Fricot tunnel, at Fricot City, has reached 300 feet, and will tap the vein at 750 feet depth.

Chronicle: M. Burton, who spent several months last fall and winter mining for quartz crystals, purchased the Boucher & Brackett gravel claim in Chili gulch for $7000 and has begun work.

El Dorado.

W. Monroe, near Coloma, found a $1000 pocket last week.

The Columbus mine, near Placerville, is being reopened. This property was abandoned years ago, owing to water and the lack of suitable pumping apparatus.

Nugget: In Cosumnes township, there is more systematic mining being done than at any time in the history of that section. Wagner Bros. are getting their mine opened in good shape. The Humphreys, J. Dunn, Whittaker & Hite, Garland and Hughes are all taking out gold.

J. Koehlert's hydraulic mine at Indian Diggings closed down on account of scarcity of water.

Democrat: The Boulder mine is putting a gasoline hoist in the main tunnel, with the intention of sinking 500 feet.

The Larkin is erecting a hoist capable of sinking 1000 feet.

F. Thomas & Co. purchased 360 acres of land near Granite Hill and began operations on an extensive scale. This is a quartz proposition, and in a shaft now sinking they have a fair prospect.

At the Starlight they are prospecting on the 400-foot level, and it is reported that good ore was uncovered the past week.

Jones & Thorsen, near Kelsey, are developing a 4-foot ledge of good grade ore.

Work was resumed at the Gopher-Boulder mine, Kelsey, after having been closed for three years. Fifteen stamps are dropping, and others will be started as soon as developments warrant.

A strike is reported in the Flagstaff, near Grizzly. The strike was made at a depth of 170 feet.

The Sunrise mine, near Kelsey, has been bonded to a company, represented by T. Dillon. The old mill is to be overhauled and equipped with new machinery, while in the mine, among other developments, a new shaft is contemplated.

Nugget: J. Melton has put men to work on the White ground, near Placerville, cleaning the old works and preparing for systematic development. It is his intention to put a 15-stamp mill on the claim.

At Grizzly Flat the Mt. Pleasant mine, which was abandoned years ago at 700 feet depth, has resumption of work and gives satisfactory results, and development of the old mine will be vigorously continued.

The Eagle King was compelled to close temporarily on account of the heavy snowfall.

Inyo.

The Reward mine, from a thirteen days' run, produced $1800. A new ore body of galena has been discovered in this property, running $60 in gold per ton.

The Jackson and Lake View property, at Lundy, will be re-opened April 1st.

Kern.

New discoveries are reported in the Panamint country; ore from that section running from $70 per ton up has been handled at the Johannesburg sampling works. As the cost of reduction work has greatly decreased in later years, the low grade ore of this section may be profitably handled which were at one time considered worthless.

The Goldman mine, near Caliente, is showing good rock as its development proceeds. The shaft is down 60 feet. The ledge is 2½ feet wide, and assays from $25 to $70 per ton.

The Maggennette had a mill run which netted $100 per ton.

A run of 3225 pounds of ore from the Yucca mine realized $432. The Merced from forty tons of ore netted $75 per ton. Eight tons of Petaluma ore produced $875.

Los Angeles.

The Puritan mine at Acton is producing pay ore from the 90-foot level. A new ledge has been discovered on this property that can be traced on the outside for 400 feet.

Madera.

(Special Correspondence).—At the Starbuck mine an old tunnel is being reopened which ran in upon the vein from the bed of Fine Gold creek. It is believed that this tunnel extends about 200 feet, and when reopened it is the intention to continue it to a point below the present shaft, in order to drain the water as well as to admit of a more economical working of the mine. In the bottom of the shaft there is a strong vein 10 inches in width. Much of the value is in sulphurets. A recent shipment of ore made for test purposes gave a return of $83.65 per ton.

Interest in the Magnet lode still continues. Lyman F. Ellis is sinking a shaft upon the lode at the Mascot location, 6750 feet northeasterly from the original Magnet shaft. The vein shows the same characteristics at this point of regular hanging and footwalls, talc gouge, etc., with quartz heavily charged with sulphurets, apparently of good grade, and a very good showing of free gold. The ore has not yet been assayed at this point. Work is temporarily stopped at the Magnet shaft pending the arrival of suitable hoisting and pumping machinery.

The pipe line to supply the Lily, Mud Springs and other mines with water from Fine Gold is in course of construction.

Gold, March 27th, '98.

Mono.

The Standard Con. Co., at Bridgeport, during the week ending March 19 crushed thirty-three tons per day, and, in addition to free gold, produced two and a half tons concentrates that run $174.72 per ton.

Napa.

Operations are to be commenced in the magnesite mines near St. Helena. Orders for ore shipments have been placed with the owners of the property.

Nevada.

(Special Correspondence).—Eastern capitalists, organized as a corporation under the laws of New Jersey, have purchased from C. D. Lane the property known as the Gaston Ridge mine, about three miles from Graniteville, for $50,000. The company has had the property under bond and expended a large amount of money in development work, the principal of this being a 2000-foot tunnel run by air compressor and power drills. The tunnel cuts a ledge of 20 feet or more at a depth of nearly 700 feet. The present 10-stamp prospect mill is to be enlarged, very probably to a 50-stamp plant.

After all the development work done by the company two practical mining superintendents have spent three weeks examining the property for the bonders, and it is known that their opinion was favorable.

In addition to these claims, the company purchases from Meade & McBeam an adjoining property which has been likewise under bond to them, and which will be operated through the new tunnel.

The Gaston Ridge mine has an authentic record of over $440,000 produced from grass roots to 219 feet depth, but it remained for the present company to develop it at depth, and the consequence has been the discovery of a larger ore body and one that holds its value fairly well.

Nevada City, March 30th, '98.

(Special Correspondence).—The Champion M. Co. are erecting an extensive plant to treat tailings, both those that have accumulated and the future product, from their 70-stamp mill. Jas. H. Rosewall, the company's chemist and chlorinator, will superintend the process on lines of his own study.

On the Orleans property, at Grass Valley, tributers have operated for some time, stoping in the old drifts at the north end of the claim, and netted $4 per day. The company is driving for the ledge on the 800 level, and expects to reach it in fifty days. Electric power is in use. The property adjoins the Empire and comprises eighty-three acres.

Work progresses favorably on the Sauvee property, in the same neighborhood. Development was recently begun on this by San Francisco people under a working bond. The property comprises ninety-three acres.

Nevada City, March 28th, '98.

Tidings: The Mistletoe mine, near Rough and Ready, is producing ore that assays $80 to the ton. The shaft will be sunk 100 feet before drifting is commenced.

The new pump at the copper mine at Spenceville has been running day and night. As soon as the water is low enough, work will be resumed taking out ore for shipment.

The new company has commenced operations at the Eagle Bird mine at Maybert. Supt. Woods intends to develop the property in a systematic manner.

Development work on the Sauvee property, near Grass Valley, continues with satisfactory results. Twenty men are employed. The parties interested are San Francisco people.

The pump being placed in the Allison Ranch mine at Grass Valley has a capacity for delivering 3,200,000 gallons water every twenty-four hours.

Union: About 100 tons of ore from the Bellefountaine mine paid $24 per ton.

Transcript: The old Sneath & Clay mine, being reopened by an Eastern company under the name of the Phœnix M. & D. Co., struck a 20-inch ledge of good ore.

At the Eagle Bird mine at Maybert has begun active operations under the new management. Supt. Wood has eighteen men employed.

At the Bellefontaine, on the 320-foot level, the ledge is from 18 inches to 4 feet thick. This property lay idle for years, but is rewarding the present operators. The company will sink an additional 100 feet.

E. Davis of Syracuse, N. Y., is in Nevada City to arrange for the opening of the Bismarck & Gladstone mine.

Placer.

The Colfax *Sentinel* says the six months just closing have been disastrous for hydraulic and shallow gravel mining operations, owing to the scarcity of water. The rainfall at Colfax to date has been 25.09 inches, as against 50.44 inches to corresponding date of last season. At Robinson's Flat, near Forest Hill, the snow is at present only 1½ feet in depth. Last season at this date there were nearly 16 feet, well settled and frozen.

The water from Hidden Treasure tunnel is as low as at the close of the summer season.

With an early spring much development will be commenced on quartz and gravel properties on the upper Forest Hill divide.

River mining can be carried on this year under favorable circumstances, as the absence of snow in the mountains will bring the river down very low early in the season.

The Morning Star reservoir, near Damascus, has not filled this winter, a condition that has not been known for years. The Morning Star and the Big Dipper mines will be run by steam during the latter part of the season.

At the Mayflower mine Supt. McAulay has fifteen men on the pay-roll. The company has had a permit to hydraulic, but thus far has not had sufficient water. A test run of ninety cars of gravel from the Mayflower mine was made recently which resulted in over $9 per car.

At the Drummond mine Supt. Berry is running on the ledge and is near the pay chute which was encountered in the shaft above. Eighteen men are employed.

The Bazacco mine, at Butcher Ranch, the property of Sheridan Bros., has a ledge from a few inches to 2½ feet in width. A tunnel has been run on the ledge 180 feet.

The Horseshoe Bar Gravel M. Co. will start the elevators soon.

At the Maus Ledge, near Forest Hill, the shaft is in 181 feet. From the 200-foot level a drift will be run to crosscut the ledge. Work will soon resume at the Spanish ledge.

The bedrock tunnel to tap the channel at the Eureka gravel mine is being rapidly driven. Last Monday week it measured 2615 feet. Supt. F. Chappellet, with power drills and two shifts, has made an average of 50 feet a week.

Supt. Power has nearly 200 men on the pay-roll at the Hidden Treasure mine. A large quantity of gravel has been blocked and drained at their point of operations in the Centerville tunnel. The gravel brings handsome returns. The electric plant is a success. The outlook for the mine is encouraging.

Herald: The electric motor is hauling out 400 cars of gravel daily for the Hidden Treasure Co., at Centerville. The company contemplates adding a new electric locomotive and 100 cars the coming season.

Dr. Manson is cleaning and retimbering shaft No. 4, which is down 125 feet on the Bellevue, at Ophir. Dr. Manson has also secured a working bond on the Decker mine, on Dutch ravine.

The Pioneer quartz mill, at Ophir, has engaged to crush 200 tons of ore for prospectors in the Ophir district.

M. O'Connor has secured a bond on the Black Spanish mine, in Ophir district.

A crew is driving the 200-foot level of the Eclipse mine. They have some good rock on the dump.

The Cash Rock mine will put in extensive machinery in the near future.

The Pioneer M. Co. is providing against future shortage of water by the construction of a dam across the American river, which, with the necessary flumes, etc., will cost about $10,000.

Riverside.

Review: The Leon M. Co. are erecting a stamp mill near Leon postoffice.

J. June has commenced operations with his cyanide plant a mile south of Good Hope.

Bates & Langford have finished their cyaniding on the old Hoag tailings. They have been occupied for six months and have produced 1000 ounces of gold.

Plumas.

The men who took the Eureka property, near Johnsville, under contract are still at work.

Many placer claims are operating in a small way in that vicinity and the general report from them is good.

M. Kniewell, in Meadow valley, is pushing his tunnel.

San Bernardino.

Reports are received of rich finds in the placer-mining section of Virginia Dale. Two men with a dry washer are said to have taken out $300 in less than thirty days.

Review: Six miles east of Danby the Jessie Lincoln group of mines, owned by Sherman Page of Los Angeles, is developing sulphate ores. A small stamp mill now on the ground is to be replaced by a larger plant.

Danby is the shipping point for the Los Angeles companies now developing salt mines thirty miles south of there. Here is the field for operating traction engines, and here lies the remains of Osborn's Leviathan—the huge monster that wouldn't pull. It is said that this experiment cost a good man an even $100,000. After this failure Best came along with his motor and hauled salt so fast the market was soon glutted. Another start is to be made, and then salt will come in at the rate of thirty tons per day.

Shasta.

Special Agent Collum of the Interior Department has finished an investigation of the devastation of Government timber by the fumes from the roasting and smelting plants of the Mountain Copper Co. at Keswick, and will recommend that the company be enjoined in the courts from operating its plant under existing conditions. It is said to be the purpose of the Department to compel the company to resort to condensers.

The output of the Altoona mine was 435 flasks of quicksilver last month. An increase is anticipated for the current month.

Sierra.

(Special Correspondence).—The Diadem quartz mine, within the town limits, is producing a species of quartz that puzzles old miners. It is rich in quality, heavily charged with sulphurets in which gold is visible, while the quartz is very hard and shines like jasper.

The Young America, one-quarter of a mile from Forest, has a bedrock tunnel 400 feet. It is intended to continue the tunnel through the ridge a distance of 1200 feet.

The Dreadnaught, near Alleghany, has 350 feet of tunnel on a ledge that varies from 3 inches to 4 feet, in a slate formation.

The Hanley gravel mine, a producing property, has nearly 5000 feet of tunnels. The main tunnel strikes the channel at 1500 feet. The gravel runs from 15 inches to 50 feet in depth. The average pay streak is 3 feet. The ground, though cement, and worked by the slacking process, pays an average of $1.50 per car.

The Rock placer claim, five miles from Forest, has a bedrock 1000 feet, tapping the channel 10 feet under bottom. The gravel streak is thought to be from 500 to 600 feet wide. The gold is coarse. The ground is hard cement and requires a mill to save the gold.

The American Hill gravel properties will be extensively worked this season. They are all drift propositions.

Forest, March 28th, '98.

Siskiyou.

Standard: Twenty-two men are at work on the Sound Money and California Queen claims at Rock gulch. The 5-stamp mill crushes ten tons per day. The vein of the California Queen is 2 feet wide. This was tapped at a depth of 300 feet with a tunnel 500 feet long.

At the Hunter & Smith mine on Cherry creek the ledge is 6 feet wide and of good grade.

The American Bar mine, near Hornbrook, is being worked energetically under the management of J. Main.

A Chicago company is negotiating for the ground along Yreka creek, between Yreka and Hawkinsville, to work it on an extensive scale. The plan is to secure the land from the Blake field down to Shasta river, and mine the ground on each side of the stream up to the Yreka town site.

Fort Jones *Reporter*: Gordon & Eaton found a 4-foot vein of good ore near Hawkinsville.

Winslow & Hunlon are taking out good pay at the Boles mine.

Bratt & Morgan have opened a 5-foot vein

near Fort Jones. From 100 pounds of ore they netted $400.

Gearhart & Gosney are developing the Morgan mine.

The Corey mine has a tunnel 275 feet on the vein, which averages 20 inches and is fair grade.

News: Andrews & Son, in Scott valley, are running their hydraulic mine. The Nesbitt & Hunter drift mine is paying well. Hossick & Milne are developing a quartz property on McKinney creek. McCauley & Son are opening up their drift mine.

Journal: The Deadwood quartz mine, owned by J. C. Schroeder of Yreka, is showing well. Mr. Schroeder has not yet concluded what kind of a mill to put up to replace the one destroyed by fire some time ago.

Austin & Co. are still running on the tunnel through the Humbug mountain, near Yreka. They are in nearly 200 feet, and find the quartz stringers getting wider, and the base rock softer. Paying ledges, such as the Schroeder, the Cherry creek, and the Humbug creek mines are in the same range of mountains.

The work of pumping the Quinne & McConnell mine, Klamath river, is progressing rapidly, and will soon be hoisting pay gravel.

The Benz Bar claim, near Honolulu, is being worked day and night with a large force, and pay gravel is realized.

Trinity.

The Mooney Con. M. Co. at Lewiston will work their three properties by the elevator process. The larger part of these flats have never been worked.

Work is progressing on the dredger at Poker Bar. J. S. Forrest of the Risdon Iron Works is superintending the building. The boat will be 70 feet long when finished and draw 2½ feet of water.

Tuolumne.

Independent: The Rappahannock is down 850 feet.

Operations have resumed at the Gold Bug mine.

A strike in the Dead Horse was made between the 1400 and 1500-foot levels — the greatest depth of any mine in the county.

Twenty men are employed on the Lafayette mine, near Big Oak Flat.

The Ribbon G. M. Co. are thoroughly developing their property near Summersville. The company is composed of San Francisco people.

The *Magnet* says the Sierra R. R. Co. has men at work near Cooperstown prospecting for coal. At a depth of 54 feet they struck a seam of indifferent quality 3½ feet thick. The company intends setting up machinery at Cooperstown, where they will bore to the depth of several hundred feet.

The Santa Ysabel mine is earning a little more than operating expenses. The latter item includes all development and similar expenses. During January the mill ran eighteen days. In February the supply of water was larger, and the mill ran its twenty stamps practically the entire month, and earned net between $2000 and $3000.

The ore is being taken chiefly from the Central ore chute and the Knox & Boyle shaft, and is running anywhere from $8 to $15 a ton.

The question of water supply has become such a serious problem to mines that the App and Rawhide among others are considering the question of electrical motive power. Should this power be adopted by mines situated near the Santa Ysabel, an amount of water could be obtained by the Ysabel more than sufficient to meet all necessities.

In the Foote mine, near Robinson Ferry, a tunnel is being run on an 8-foot vein. The ore assays well in free gold and sulphurets.

The crosscut tunnel on the Ribbon Rock has reached 463 feet.

The Alabama mine, near Quartz Mountain, has closed down indefinitely.

NEVADA.

The *Reveille* says T. J. Bell sold his interest in the Ione M. Co. and resumed operations on his placer claims.

G. Veatch received $15,000 for his Union canyon mine, near Ione.

The Boston Nevada Copper Co., in Mason valley, has 400 tons of ore ready for smelting and has also uncovered a new deposit.

The Golden Eagle, near Winnemucca, made a shipment of $60 ore. It went 14 per cent lead, thirty-four ounces silver and two ounces gold.

The Chainman Co., operating at Ely, has bonded the Golden Revenue mines, four in number, adjoining the Chainman property, for $60,000. They have also bonded the Jupiter series for $25,000. There are about forty-eight men working in the Chainman property.

A vein of ore 50 feet in width so far as prospected, and assaying over $5 a ton gold, is said to have been developed in the old Lady Bryan mine in Lyon county.

A company organized by Jeffersonville, Indiana, capitalists to be known as the Oriental & Belmont Con. M. Co. will develop properties at Eureka. Sinking begins at once, and machinery will be erected as rapidly as needed. P. C. Donovan will be Supt.

It is stated that G. Simmons, discoverer of the turquoise mine on Timber mountain, has disposed of $67,000 worth of gems to New York jewelers, and that he has two cutters on the ground freeing the gems from extraneous matter.

R. H. Aiken, who bonded the Aiken group, near Pioche, has begun work. The claims are to be prospected thoroughly.

Ex-Mayor Davie of Oakland has put men to work at the Olinghouse mines on the Washoe tunnel to advance it 50 feet in search of the ledge that shows on the surface. About 280 feet of work was done on the tunnel several years ago, but was abandoned for want of funds.

OREGON.

The Courtney & Kramer mine, seven miles from Grant's Pass, crushes three tons per day. The result of a run of fifty hours yielded 13⅘ ounces of amalgam valued at $135. The Jupiter G. M. Co. have begun extensive operations in the same neighborhood.

The Grants Pass *Journal* says that quicksilver is soon to be produced from the Black Butte mines in Lane county, seventeen miles from Cottage Grove, by the Black Butte M. Co. The ore runs as high as 56 per cent mercury. A 30-ton furnace condenser and dryer is in course of construction. The property is expected to be in operation the coming season. The property consists of 1040 acres along the top of Black Butte. The cinnabar ore mixed with a decomposed quartz crops out for 4000 feet. Six cuts and two tunnels have been made, from which assays were made showing from 3 to 40 per cent quicksilver.

The Oro Fino M. Co. near Merlin has contracted to furnish sixteen cars of ore to the smelter. From a shipment made some time ago the company realized from one ton $1760.

The first $10,000 payment on the California and Hidden Hand mines in the Cable Cove district has been made by J. W. Connors and associates to Cabell Bros. The terms of this transaction were $100,000 cash, the mill to be in operation by December 17, 1897; $10,000 March 17th, $10,000 June 17th and $10,000 September 17, 1898.

La Bellevue mine, near Baker City, will commence crushing ore April 15, with a capacity for fifty tons daily.

R. D. Hume has bought the Huntley mine, a copper property, for $20,000. The mine is fifteen miles from the mouth of Rogue river.

The Greenback mine, near Grant's Pass, make a cleanup of $3500.

WASHINGTON.

The Bull Frog Co., near Loomis, has sunk to the 100-foot level. Drifting from the 100-foot level will crosscut the ledge.

The Golden Zone Co. on Mt. Chapaca is making good progress in ore of high grade. Work will shortly commence on a new tunnel 100 feet lower than the present work.

The Eureka G. M. Co. has put men to work on the North Star claim at Republic. Work on the Pittsburg has begun under the same management. Ledge matter is beginning to show up in the Tom Thumb, assays of which give $3.10 in gold values. The second carload of ore from the Republic mine returned $114 per ton.

A half interest in the Lost Lode claim at Republic was sold to F. H. Oliver for $25,000 cash.

BRITISH COLUMBIA.

(Special Correspondence).—E. Blewett and associates have made final payment on the Treasure Mountain property, near Vancouver. At 125 feet the vein assays from $20 to $28, mostly copper. The last shipment of 200 tons picked rock from the Van Anda, at Van Anda, netted $8000. The Raven mine, near Van Anda, has also made a successful first shipment.

The Channe Co. have purchased four claims on Hansen island. A trial shipment will be made from them shortly.

Vancouver, March 26th, '98.

Spokesman-Review: The Monita, near Rossland, has been purchased by the War Eagle C. M. Co. for $94,000. The Monita was stocked for $750,000, and market quotations have been from 12 to 15 cents. The balance of the purchase price of the Whitewater mine, near Whitewater, was paid last week. The price is not made public, but it is generally understood that the transfer was made on a basis of $450,000. The Whitewater has paid in dividends to date $154,000, and was shipping 200 tons per week when this deal was made.

The mill of the War Eagle is to be operated by electricity, also a 40-drill compressor, and a 150 H. P. hoist.

The Le Roi Co. will put in an electrical plant to furnish 300 lights for surface use.

The tunnel on the Dardanelles, at Kootenay, has reached 204 feet, showing a lead from 3 to 6 feet wide, assaying $22 per ton.

The Gertrude claim, near Rossland, has been sold to a company for half the stock of the new company, with $40,000 to be placed in the treasury for development purposes.

A car of concentrates from the Fern mine at Nelson realized $60.78 a ton.

M. Alexander, representing an English company that bonded the Mollie Hughes group near New Denver for $40,000, is reported to have paid the money and put twenty men to work.

ALASKA.

The Postmaster-General awarded the contract for carrying the mails from Juneau to Weare, at an annual compensation of $56,000. Weare is at the junction of the Yukon and Tanana rivers, and the route is 1618 miles. The contract provides for two round trips a month for four years, beginning July 1, 1898. The principal intermediate points on the route are Dawson City and Forty Mile, Canada, and Circle City, Alaska.

THE KLONDIKE.

In last week's issue was mentioned the luring tales that find their way into the press dispatches, "special correspondence," "private letters," etc., regarding the wonderful richness of some hitherto unheard of region. The following, which appears with much prominence in the San Francisco *Call* of the 31st ult., is a good example of this kind of thing:

RAMPART CITY, Nov. 16th, '97.

Friend Ralston: You will be surprised if this letter reaches you. Remember when I left you at St. Michael on the 27th of last June. You were bound for Dawson, and all those at St. Michael were very much excited when Clarence Berry arrived there from Dawson with so much dust. You left on the Bella on the 28th of June, and on the following day I left with the natives in a skin boat for Port Clarence, that being as far as I could induce the natives to go. From there I got another native with a skin boat to take me to Kotzebue sound, but I could not induce him to go up the river unless I gave him whisky. Not having the requisite, I was obliged to look for some one else. Not having much trade in their line, I was finally obliged to give them what tobacco I had for our own use.

Jack Hayes had a gallon of alcohol and some drugs, and with this we made about four gallons of whisky. With this we finally induced the natives to continue up the Kubuck (Kowak) river as far as we wanted to go.

Our original intention was to go as far as Fort Cosmos, but before we got there the Indians told us two white men had gone up before us and were on a small stream where they were getting plenty of gold. We thought this too good to be true, but concluded to follow on around to where they were. Imagine our surprise to find them with not less than $25,000. The mosquitoes were nearly hell, and as we had not much provisions we started in to do our best. Our fondest hopes were more than realized, and in twenty days we cleaned up with, I should think, about $50,000.

This was about August 25, and our two friends were thinking of coming down the river in the hopes of getting to St. Michael before the last boat would leave for San Francisco. They started, but we concluded to stay ten days longer and take our chances in getting out. Two days after they left a native who had been farther up the stream hunting deer came back with plenty of fresh meat and a nugget that will not weigh less than twenty ounces. I gave him the last plug of tobacco I had for it. I hated to part with the last plug, for gold was more plenty now than tobacco. We went on up the creek. The native led the way to a small riffle, where he found it, and we commenced work and found it in such quantities as to make us almost crazy, often getting ten ounces to the pan. In ten days we washed out $50,000. Oh, how we hated to leave! We had only fifty pounds of flour left, and very little tea and sugar, so we started down to the mouth of the river, and when we got there the weather was getting cold. Ice was making fast in the Kubuck, and the natives told us we could not go down until it froze up. They also told us that it was as near to go to the Yukon as to the mouth of the river, and they agreed to go with us if we gave them some tobacco and whisky when we reached the Yukon.

Here we stayed with them until October 15, when we started, coming by the way of Zanes pass and reaching Mulatto after fifteen days' traveling. There we got some flour and a little tea from a half-breed trader, and I also got some tobacco for the natives, but no whisky. The natives would not go any farther, so I stayed there until November 10, when, hearing that there were plenty of supplies at Rampart City, we started for this place, which we reached in five days.

Skink Miller told me you went down the river on the J. J. Healey, so I suppose you are in San Francisco now. I hope so, and I hope this letter will reach you. I intend to stop here until the river opens and then go down to St. Michael and purchase supplies from the Commercial Co., or else go to San Francisco. I have plenty of dust now to charter a vessel with and take back all the supplies I want. If you should receive this letter wait in the city until I arrive, as I will be down on the first boat from St. Michael, and we will return as soon as we can charter a boat and purchase supplies.

Hoping this will reach you, I send it with the mail that is going to leave here to-morrow. I am paying $50 postage on it, but that is nothing, as I have better ground than any on the Klondike, as you will say when you see it. Kotzebue is the richest spot on earth.

Hoping this will find you all well, I remain, your friend, JOHN ROSS.

That is the kind of stuff that sends men pell-mell up there. The man who buys a lottery ticket is a model of sober business discretion compared with the one who is influenced by such statements to make a similar attempt to achieve such alleged success.

Major L. H. Rucker, U. S. A., who has returned from Dyea, says that five officers and twenty men of the relief expedition are at Haines Mission. They arrived there March 24th. They start on an exploring expedition to find a suitable all-American route to the Yukon. Captain Abercrombie, who heads the party that will explore the Copper river country for the War Department, will go north this week. The Government pack train that went north on the Lucille is still encamped at Dyea. The bulk of the supplies that were to be taken to Dawson are at Dyea. It has not yet been decided what disposition will be made of them. The Dalton trail party took its supplies out of those on the relief expedition.

Thousands are working to cross the Chilkoot and White Pass trails. All who have the proper grit will get over by the time the lakes and rivers open. Five acres at Sheep Camp are piled up close with outfits that have been hauled from Dyea. They are piled on the snow and left without guard until the owner gets all his goods to Sheep Camp. Nothing is stolen and the packers never worry about their goods. Some of the goods taken up last winter are being dug out of the snow. If a man does not want to haul his outfit there are three ways by which he can get it to the summit. There is a train run by electricity, a rope and tackle arrangement and a gasoline engine method. By these means seventy-five tons a day are handled. There are men, Indians and dogs on the trail in large numbers.

UTAH.

The Mercur mill at Mercur treats 300 tons daily. The Mercur mine has paid $922,000 in dividends.

Capt. DeLamar will have spent more than a million dollars on his Golden Gate mine and mill before a wheel is turned in the latter. For less than seven acres of ground he paid the Mercur Co. $237,500.

At the McKinley, near Mercur, the ore body is being penetrated by shaft and tunnel. The vein averages 4 feet in thickness, the center of which contains silver chlorides.

The Ophir Hill mill at Mercur will be enlarged this spring.

Cinnabar ore is being extracted from the Florence claim of the Geyser-Marion.

Last week's shipment of copper ore from the Ajax amounted to $3000. It was the third this month.

Near Frisco the Galena Co. has reached a depth of 200 feet and started a drift to crosscut the ore chutes. The material in the drift assays $5 in gold; some lead and silver is encountered.

M. Anderson made a discovery of a 12-inch vein of 40 per cent copper in the Frisco district.

The El Dorado, of Bingham, made its first shipment of ore. It makes a good showing in copper, lead and silver. Traces of gold are also shown.

IDAHO.

Considerable development has been done on the Golden Fleece and Star mines near Placerville. The ledge averages from 8 inches to 4 feet and the ore runs from $20 to $80 per ton in gold.

The new tunnel of the Mammoth, near Wallace, will approximate 4000 feet, and in that distance will cut at least three ledges, besides the one on which the Mammoth is located. The Mammoth will have nearly a mile on the main lead, and will cut this lead 2000 feet below the apex.

The New England Dredge Co. is satisfied with the results of prospecting at Idaho City, and has ordered a dredge to be placed on the property at once.

The Twin Springs Co. has begun preparatory work with a large force on the property at Idaho City purchased from K. P. Plowman.

The Pueblo mine, near DeLamar, has reached 600 feet in tunnel and has a 5-foot vein, furnishing twenty tons per day. The ore mills $40 per ton.

The Blackbird mine, at Custer, made a clean up of $500 last week.

Upon petition of L. Cushing of Boston, Judge Knowles of the U. S. Court at Butte, Mont., appointed a receiver for the American D. & M. Co. The company formerly had an office in Butte, but moved to Gibbonsville, where the company has several mines, mills and general stores. It also has mines at Whitehall, Mont. The indebtedness is placed at $275,000, of which $45,000 is on an overdraft at Clark's bank in Butte, $8000 in wages and salaries and $12,000 on notes held by Boston parties.

The Granite G. M. Co., near Murray, has opened a vein that ranges from 20 to 32 feet wide.

South & Weidner have cut a 6-foot ledge of copper ore at a depth of 145 feet, near Blackbird.

MONTANA.

The Butte *Miner* says it is definitely stated that the Lexington mine will be started up in the next six weeks by a London company, and that efforts will be made to make it a copper producer. The property has been involved in litigation, and that, with the low price of silver, so affected the price of the property that it was sold to one of the London stockholders of the company for less than $60,000. The mine is down 1600 feet, and has miles of crosscuts and drifts; it has been one of the big silver producers of the camp.

The trial of the Butte & Boston M. Co. vs. the Montana Ore Purchasing Co. was concluded on the 25th ult. The plaintiffs asked $150,000 damages for ores alleged to have been extracted from the Michael Davitt mine by the defendants through the workings of the Rarus mine, owned by the defendants. The defendants admitted the taking of the ore, but claimed it was theirs, and not the plaintiff's. Their claim was that the ore bodies in the Michael Davitt were part of the Rarus lode, or zone, seeking to establish the broad zone theory. The plaintiffs denied that the Michael Davitt veins were part of the Rarus lode, and contended that they were separate and distinct veins, with their apex in the Michael Davitt ground. At the conclusion of the arguments to the jury Judge Knowles instructed that body to return a verdict for the plaintiffs, and find that the ores in dispute have their vein apex in the Michael Davitt claim and belonged to the plaintiffs. He left to the jury the question of fixing the amount of damages according to the value of the ore taken from the ground.

From three to five cars of ore per week are shipped from Pony. The producers are the Belle, Summit, Mountain Cliff, Willow Creek, Ned and Watseka.

Call: The Hull & Calhoun property near Philipsburg was sold for $6000 to J. A. Murray of Butte. He will immediately build a 30-ton cyanide mill and develop the mines.

The *Independent* says the number of mills reported in this State for 1896 was 548, with 6622 stamps. For 1897 it is estimated the stamps equaled 8000. In 1898, owing to the revival in mining, it will be within bounds to add 20 per cent in increased stamp capacity.

SOUTH DAKOTA.

The most pretentious mining publication ever issued in that region is the Black Hills *Mining Review*, of date March 21st, at Deadwood—a finely illustrated exhibit of the extent and richness of that section. At present there is employed in the mines there 3235 men, earning $4,000,000 per year. The *Review* says that the gold product for '97 aggregated $6,524,000.

The Chicago & Two Bit Co. has reached a depth of 230 feet in its shaft at Two Bit.

The Pyritic Queen was sold to the New & Black Hills G. M. Co. C. E. Hugh will be Gen. Mgr. Work begins at once. The property is in Two Bit.

It is stated that $50,000 has been taken from the Little Blue mine in the last six months. This property has been developed in a year and is now a regular producer.

The Rand gold output in February was 297,975 ounces, against 211,000 ounces in 1897

WYOMING.

Several promising mines are being opened near Gilman, showing veins 8 feet wide, carrying 60 per cent copper. On the placer fields of Independence mountain, covering an area of 75,000 acres, a hydraulic plant was erected last season, which made a three weeks' run before winter set in, cleaning up $14,000.

A gold discovery has been made near Sheridan on which exploration work has developed a vein 2½ feet thick; the ore assays from $4 to $140 per ton.

A body of free-milling ore 16 feet in width, from which the general average of nine assays returns $114.11, has been opened near Grand Encampment.

COLORADO.

The Amelia J. and Picayune, at Saw Pit, made their first shipment. This ore averages $40 per ton. Owing to the small cost of production the owners realize a profit of $25 per ton. The gross value of the product of the Corbett and Lizzie G. is from $40 to $50 per ton in gold and silver. The Corbett is ship-

ping eight cars per week. The Lizzie G. is producing six cars of ore weekly.

E. Parvin bought the Hart group, at Victor, for $35,000. The Uintah tunnel is shipping rich ore. The Strong divided $60,000 per month between its four owners for several months past. The Emma No. 2 is credited with shipments aggregating $200,000 in the past three months.

The Hines lease, on the Pharmacist, has come into a body of ore of 5 feet of quartz averaging $18 per ton. The shipments from the Zenobia last week consisted of 23 tons of $70 ore and 150 sacks of $150 ore. The Lillie is marketing ore at the rate of forty tons per day. The Little Pearl entered a 3-foot ore body which returns from $12 to $78 per ton. The monthly output of the Anaconda, in Gold hill, is given at 500 tons

E. C. Allen, Supt. Forest mine, in Wall-street Camp, Boulder P. O., will build a double-track tramway from the mine to the railroad—700 feet. Over 1400 feet of steel rope will be required to operate the tram. The Forest has a 6-foot vein of low-grade ore, which is being handled profitably. The mine is shipping thirty tons a week.

Reporter: The Virginius, at Leadville, maintains its regular output of silicious ores and work progresses on the New Monarch shaft of the company.

The Ibex M. Co.'s production averages 350 tons a day of oxide and sulphide ores. From the several mines in the Weston Pass district, 150 tons of silver-lead ores of good grade are shipped daily.

Eighty men are at work on the Resurrection mine and the monthly production is in the neighborhood of 2500 tons. It is calculated that this output can be maintained for the balance of this year.

Although the Banker's shaft, on Breece hill, is over 650 feet in depth, it is expected that it will take 250 feet additional before the ore plane will be reached, and probably 100 feet more before results will be obtained.

The Pyrenees shaft touched the lime formation at a depth of 1064 feet.

The U. S & B. C. M. Co. made the last payment on the Liberty Bell, Greenback and Lucky Girl claims, near Telluride, which it bonded last summer for $50,000. Since then it has purchased the St. James placer property. A new mill of a large capacity will be built near the Alleghany on the St. James placer, which will be connected with the mines by a bucket tramway 11,000 feet in length.

The tunnel being driven on the vein of the Waterloo group is in 500 feet and in its breast shows 7 feet of ore. Assays last week produced good results and the ore is being piled up for treatment when milling facilities are provided, which will doubtless be this summer. The group is under bond to the San Juan G. M. Co., which intends to equip it with all the improvements necessary, including a stamp mill. It is estimated that there is enough mineral blocked out to supply a 20 stamp mill for the entire season.

The Franklin mine, near Boulder, has given net returns of $25,000 the past year.

It is stated on reliable authority that the daily output of the Strong mine at Cripple Creek the past two weeks has been 300 tons of ore per day, and that this production is to be maintained for an indefinite period. Fully 90 per cent of the ore shipped is high-grade smelting ore.

The Big Four Co., near Leadville, are working sixty men. The production of the mine is not great as to tonnage, but the output is of valuable character.

The operations of the Lillie G. M. Co. for February show ore shipments amounting to 1058 tons, which carried a gross value of $41,328.62. The entire operating expenses amounted to $20,766.58, leaving a net profit of $20,562.04. The company now has a cash reserve of $72,000, $11,562.04 of which was added during February.

The strike in the Enterprise at Eldora shows a vein over 5 feet, which assays from $50 to $150 at 110 feet.

Twenty mines near Eldora are taking out shipping ore. The Revenge has ore worth $3 a pound.

The El Capitan on Copper mountain has been leased for $20,000 to Thayer Bros. of Cripple Creek.

The Cripple Creek placer, containing fifty acres adjoining Cripple Creek, has been sold for $10,000 to Colorado Springs men.

The *Telegraph* says with a fair prospect of the first three months of '98 showing a gain of over $2,000,000 in Colorado's gold output, compared with '97, the twelve months is admitted as most likely to show an approximate gain of $8,500,000. Reliable authorities anticipate that this year will be a good one for the State's mining industry. Their belief is stimulated by the knowledge that a great deal of new milling machinery is going into the various districts to utilize the ores of newly developed properties and old ones. The demand for mills and other machinery is keeping the dealers in such material busy, and the railroads are feeling the effects of this traffic as well as all other lines of business throughout the State.

A mill is to be erected on the Gold Pan group, near Breckenridge. The Hamilton M. & M. Co. is producing 100 tons of iron concentrates each month.

H. N. Brevourt is driving a tunnel at the rate of 10 feet per day in the Galena mine at Cripple Creek. It has reached a depth of 200 feet. Mr Brevourt holds a bond for $30,000 on the property.

S. B. Corrington, at the 120-foot level on the Sumpter, reached a body of sylvanite ore assaying from $200 to $300.

The Lord Fauntleroy has been leased for $30,000 for two years.

A trainload of ore from the Johnson, at Cripple Creek, was shipped last week. It was one week's output and averaged five ounces a ton. The daily output runs thirty tons.

The Annie is making shipments that run from eight to ten ounces per ton.

Gaffney Bros. shipped twenty tons of $40 ore.

The Orphan Bell is shipping sixty tons of ore per day.

The Pauper, at Victor, is outputting fifty tons per week. The ore is divided into two grades that run $125 and $60 per ton.

A third chute was cut in the fifth level on the Modoc. The ore is 2 feet wide and assays $80 a ton. The property has passed from the lessees, who netted $60,000 from their operations.

The Gold Dollar, on Beacon, sent out twenty tons that run twelve ounces.

Ore production at the Vindicator is going on at the rate of sixty tons per day, and a large force is employed in development work and blocking out reserves.

The Potvine and Vane are outputting ninety tons a week of $60 ore. Returns from a shipment of seventy-five tons gave a result of $69, and the low grade ore $45 a ton. Some high grade ore is being saved which is worth from $200 to $300 per ton.

C. Thurlow has secured control of the principal producers of sulphide ore at Rico, which includes the Logan, Wellington, Princeton and C. H. C. groups, and also the Chicago and South Park mines. The consideration amounts to over $200,000. He will thoroughly develop the properties as fast as possible, with the end in view of establishing a smelter at Rico for the treatment of pyritiferous ores.

The Twin Lakes Con. Placer Co., near Leadville, is establishing ditches and flumes for washing some of the bars of Lake creek this season, which will be done by hydraulic workings. The company own 4000 acres of placer ground and contemplate building a ditch next fall twenty-five miles long at an outlay of $150,000.

Liggett, Owens & Co. are shipping ore from the Garfield-Grouse at Cripple Creek at the rate of one carload per day, and the ordinary shipments run better than $100 per ton in gold, while the selected ore runs high. Last week a seven-ton shipment of sorted rock was sent out that runo $1000 per ton and five tons of sorted ore that runs $500 per ton. The fifth level is now being run at a depth of 310 feet, where the lead is found to be 4 feet in width and carrying an 18-inch pay streak. Nineteen days after resuming work the lessees cleared $6000 for themselves and paid an equal amount to the company. The March output will reach at least $1000 per day, and the lessees feel confident that their share of the profits will be from $12,000 to $15,000, while the company will receive a like amount. Ninety-five men are employed.

The Pinto Co. is pushing its shaft on the Free Coinage as rapidly as possible for a new level to be run at 450 feet, and a steady production is kept up from the 350 level.

The Burns is approaching a stage of steady production, ore being hoisted daily.

The Vindicator Co. has started crosscutting at 530 feet. Production is close to sixty tons a day, running from two to four ounces a ton.

A strike was made in the Village Belle, at Eldora, in the 165 level, of a 3-foot vein of high grade telluride ore.

Judgment for $11,431.25 was rendered in favor of the Percy Con. M. Co. against the Durant M. Co., the Compromise M. Co. and D. M. Hyman in the U. S. Circuit Court. A motion for new trial was overruled. The suit was brought to recover the value of ore alleged to have been extracted from the property of the plaintiff.

The deposits lately discovered near Pagosa Springs are attracting attention from prospectors.

At Blackhawk 510 stamps are crushing 600 tons per day, which, with the tonnage smelted, brings the total treated daily to 800 tons. The New York mill, of seventy-five slow-drop stamps, is to be changed to fast-drop stamps.

The Colorado Springs *Telegraph* says there is no other section of the district receiving so much attention from the prospectors as the foot of Battle and Squaw mountains at Victor. There are veins cutting off into the granite from the contact, and many are being developed through and on all sides of the town of Victor. The success of the Gold Coin Co. has been an incentive to exploiting these veins, and there has been much encouragement, particularly in the Fortune, the Spicer, the Santa Rita and the Home Run. The new plant on the Granite is in operation and shipments are going out at the rate of 500 tons a month. A high-grade shipment was made from the Gaffney on the old workings of the Pharmacist.

The Blue Bird Co. is shipping an average of 100 tons of smelting ore a month.

Courier: The ore body in the middle level of the Maud S at Georgetown has opened to 30 inches in width. There are being worked in the district twelve mines, of which six are shipping, the monthly output being sixty tons of smelting ore and 1000 tons of mill dirt. Employment is given to 150 men, the monthly pay-roll aggregating $12,000. There are three concentrating mills in operation.

For the first two and a half months of 1897 the camp of Ophir shipped forty-two cars of ore, and for the corresponding period of this year it shipped 150 cars.

The Shoemaker mine is treating ten tons a day, which average $25 a ton.

The Meldrum tunnel, which is to cut through the mountain to a point near Ironton, on the Ouray side, is being driven by a Scotch company. Work was commenced Jan. 15th at both ends of the line. It is now in about 400 feet at the Telluride end. The entire distance is between four and five miles, and to complete the tunnel will require about two years. The power plant at Pandora, where the tunnel starts at the Telluride end, has a large compressor at work, and work is being pushed rapidly. The dimensions are 12x15 feet, and it will connect with the railroad at Ironton. The distance from Telluride to Ouray is fourteen miles. The tunnel will cut the Tomboy, Japan and a number of other leads on the Telluride side and a number on the Ouray side. There has been no timbering done so far, the tunnel running through the solid rock. It has no connection with any mining property, being solely for transportation purposes.

At Cripple Creek the Uintah tunnel is making a daily output reported to average three ounces gold per ton.

Two cars of second-grade ore per day is the output from the Anna J. mine.

The Van Tilborg is producing ore running from $40 to $80 per ton.

Five cars of ore were shipped the past week by the Raven Co.

Shipments for the week from the Moon-Anchor have been 120 tons smelting and forty tons millstuff.

NEW MEXICO.

M. E. Becker, near Albuquerque, shipped six tons of ore to the smelter which returned 60 per cent lead, $5 in gold and $3 silver.

The Ortiz mine at Dolores is producing fifty tons of ore per day. Concentrators will be placed in the mills shortly.

Steen & Coble, near Amizette, began operations on the Iron Dike, a large vein of low-grade ore. They will push the work night and day.

H. H. Argue will begin active operations at hydraulic work and dredging near Elizabethtown this week. J. R. Beaty is preparing for extensive placer operations on Ute creek.

Work on the Dell mine at Hillsboro started last week.

Good ore has been encountered on the Scandia vein at Hillsboro.

R. C. Troeger has purchased the Bonanza mine in Sierra county and starts work next month.

S. M. Ashenfelter paid $1000 for an option on the Climax and Standard mines at Las Cabesas. The purchase price is $15,000. The ores of the properties average $25 per ton.

The Copper Glance mine in Taos county has been bonded to Boston and Chicago parties.

The Othello and Desdemona properties at Cook's Peak, operated by the Kansas City Smelting and Refining Company, produced 10,800,000 pounds of lead and 81,500 ounces of silver in 1897.

The Folsom group in Hell canyon has been bonded to Illinois parties for $30,000.

Z. Hirshberger is working fifteen men on his Pinos Altos property and shipping regularly.

The Modoc mine in Dona Ana county has resumed operations.

The Columbine mine at Red river has a 7-foot vein of $7 ore.

The *New Mexican* says that a sale has been made at Bland to W. J. Cartan of six Cochito claims for $150,000. The properties are the Good Hope, Hopewell, Allerton, Black Girl, Posey and Last Chance No. 2. The Good Hope property has demonstrated itself a successful producer. The Black Girl has produced milling ore. The vein on the Black Girl shows an average width of 10 feet for several hundred feet on the surface.

Davidson & Bell are working twenty-five miners upon the Golden Giant mine near Silver City. The drift on the 450-foot level has been run 70 feet, in ore all the way. On the Atlantic mine the fifth level was started at a depth of 417 feet. The south drift has been run 640 feet; the ore vein is 29 inches, solid and clean, requiring no assorting before shipment.

The Western Belle mine has a vein 14 inches in width running from one to four ounces of gold per ton.

Five cars of copper ore were shipped last week from the Santa Rita copper mines, the smelter at Santa Rita having temporarily suspended operations. Shipments of iron ore from Santa Rita average three cars per day.

The Hanover mine has opened a deposit of copper ore, at a depth of 60 feet, 60 feet long, 30 wide, and so far as developed 50 in depth. The ore averages 20 per cent copper.

The Confidence mine is producing eighty tons per day and making regular bullion shipments.

The Old Reliable M. Co. will begin in the near future to develop the Cullen group of mines, in South Santa Fe county.

ARIZONA.

(Special Correspondence). — The Elkhart group of mines and mill at Chloride, twenty-five miles north of Kingman, belong to the Security M. & D. Co. Theo. B. Comstock is Gen. Mgr. and Robt. J. Ferguson local Supt. The mine has considerable development from a 280-foot shaft on the vein. The ore is low grade, being a sulphuret of iron and lead, carrying gold and silver. The mill has a capacity of 100 tons per day. The high grade ores are shipped to the smelters.

The Schuylkill endlines with the Elkhart and is well developed, having a large quantity of ore in sight. This is under the management of F. W. Theis.

Along the same lead is the Tennessee, which is being developed by a company of which E. T. Loy is Mgr. This property has a shaft 180 feet in silver-lead ore, carrying some gold. The Merrimac, two miles south, is being developed by the same management.

The Minnesota is the oldest location in this section. It has undergone thorough development within the past few years by its owner, John Barry, who has a 10-stamp mill on the ground. The Minnesota is producing high grade silver-lead ore, running 400 to 500 ounces in silver. The low grade ore is said to run about sixty ounces silver.

The Oro Plata, in Tub Basin, belongs to J. W. Gerritt of Kingman, and is being worked by Clack Bros. & Poland, lessees. There is a shaft in 150 feet, from which development work has gone on extensively. The ores are a sulphide of iron and lead, carrying gold values, and is a smelting proposition, though there are low grades which might be milled.

At Mineral Park there is renewed activity. The Buckeye is being developed and lessees are working on various properties. The values in Mineral Park ores being principally silver, and not generally adapted to the milling processes in vogue, the output at present is restricted to high grade ores.

The Temple Bar Con. M. Co., which owns extensive placer gravel banks on the Colorado river, north of the White hills, is putting in machinery for a steam pumping plant, by which they will get direct action of the water from the river against the gravel banks without the use of a reservoir. These improvements are being put in under the management of H. J.

Ladue-Yukon Transportation Company "Gold Pick Line."

FOR Copper River, JUNEAU, SKAGUAY, DYEA, (VIA SEATTLE.)

THE FAST, ELEGANT AND COMPLETELY REFURNISHED STEAMER "MORGAN CITY," CAPACITY: 700 Passengers, 2500 Tons of Freight,

WILL SAIL FROM SAN FRANCISCO (ON HER ARRIVAL FROM NEW YORK) ON OR ABOUT

APRIL 10th, And take the Outside Passage for JUNEAU, thence to SKAGUAY, DYEA and COPPER RIVER.

In this way the Dangers of the Inside Passage will be avoided. The "MORGAN CITY" is one of the Finest Steamers afloat, lighted by Electricity, Elegant Accommodations, Ladies' Boudoirs, Social Hall, Smoking Rooms and Buffet, large number Handsomely Equipped Bath Rooms, furnished with Porcelain Bath Tubs, Steam Heat; 20,000-Candle Power Searchlights. The Best Table will be Served on the "MORGAN CITY" of any Steamer on this Coast. This Steamer will later on run between SAN FRANCISCO and ST. MICHAELS.

—— FOR PASSAGE, FREIGHT OR FURTHER INFORMATION, APPLY ——

JOHNSON-LOCKE MERCANTILE CO., GENERAL AGENTS, 609 Market St., San Francisco,

Or . . . Mutual Life Insurance Building, SEATTLE, WASH. JOHNSON, CARVELL & CO., 346 North Main Street, LOS ANGELES, CAL.

Delamer. The property is on the Nevada side of the river. The plant is expected to be in operation by July. The Santa Ana and the Alamo Cos., both under the same management as the Temple Bar, have similar holdings in the same locality. WASCORT.

Kingman, March 22nd, '98.

Young & Simpson have opened a paying placer property twelve miles north of Dos Cabezas. The ground is said to pay $10 per ton. The gravel will be worked by milling process.

The El Colon mine near Hermosillo shipped three carloads of silver and gold rock, averaging 400 ounces silver per ton.

The Golden Wonder mine, near Payson, has a 4-foot body of free-milling ore which will average $20 per ton. The ore body was found at a depth of 300 feet.

D. Snyder is working a copper property, near Tucson, and making regular shipments carrying from 27 to 32 per cent copper.

Republican: F. F. Childers is developing the Grand Prize mine near Payson, where he is running a 3-stamp mill, the concentrates being shipped to Pueblo via Phœnix at a cost of $51 per ton. These concentrates run from $115 to $125 per ton, gold principally. Mr. Childers hopes to secure a smelter of small capacity. There is plenty of lime in the vicinity of the Grand Prize and wood is nominal in price. The shaft is down 265 feet. On the Golden Wonder mine near Payson the lessees struck a 5-foot vein of free-milling ore at a depth of 200 feet. The property is bonded to M. Derrick, who expects to put up a mill.

The Lone Star group, comprising eleven claims in the Globe district, were bonded to Qualey Bros. of Chicago, who have done enough work to make it clear that a 30 or 50-ton smelter can be operated successfully. Several 100-foot shafts are down. D. A. Carpenter of El Paso says it is a settled matter that the smelter will probably be built a few miles from Safford. By April 15th it is expected 100 men will be connected with the development of these claims.

The Ingersoll mill at Tyson's well is running on ore from the Guadalupe M. Co. The Guadalupe is an old mine that was abandoned many years, until taken hold of by the present company. The new owners have struck at a depth of 100 feet a 3-foot ledge that will average $35 per ton.

The Grand Canyon M. & D. Co. is preparing to extract gold from a number of bars in the Colorado river, in Mohave county. P. Rifenberg has charge. Several other companies are preparing to develop these gold deposits, which extend almost 100 miles along the river above Bonnell's ferry.

The Santa Ritas is shipping ore.

Two of the main shafts in the Congress mine have reached a depth of 1800 feet, a third shaft having a depth of 1000 feet. The newest of the shafts has been sunk through a ledge of ore hitherto unexplored. Values and quantity are found almost uniform throughout, the ledges averaging 4 feet in width and carrying $20 to the ton. The iron pyrites stripped of quartz run $160 to the ton. About 100 tons a day are worked, a cyanide plant taking up the values passed by the concentrators. More extensive reduction works are to be put in soon.

The Rainbow mine, Mohave county, on the 130-foot level struck a body of ore that will average $40 per ton. Three carloads of high-grade and 400 tons of second-class ore are on the dump.

The Azurite mines near Tucson have 4000 tons of ore on the dump running from 8 to 12 per cent copper and from $4 to $17 per ton in gold. The high-grade ore will be shipped until the company erects a smelter.

The President mine, in the Santa Maria section, has two shafts in ore, one to a depth of 180 and the other 90 feet.

The Bain group in Pima county is showing copper ore.

The cyanide plant at the Little Jessie mine, Chaparral gulch, Yavapai county, will soon be increased to 100 tons capacity.

The Atlanta mine in Chloride district, Mohave county, will sink a new shaft below the old workings. Thirty tons of ore shipped, yielding satisfactory returns.

A strike is reported in the Norma mine, near Kingman, of an 8-foot ore body showing silver and gold.

S. B. McConnico and associates of Boston secured a lease and bond on the Altata mine, near Chloride. As soon as the old shafts are cleaned, sinking and drifting will be pushed. If development results satisfactorily, a concentrating plant or a copper-matting furnace will be erected, according as the character of the ore shall determine.

Phelps, Dodge & Co., owners of the Copper Queen of Bisbee, purchased a controlling interest in the Detroit Copper Co. of Clifton for $1,000,000. They have rebuilt the plant and doubled production. The Arizona Copper Co. at Clifton has increased the capacity of its plant and is producing about ten tons per day. This property is owned in Scotland. Its stock could have been bought for 75 cents per share a few years ago, and it is now selling at $25.

The Golden States Co., near Tucson, reports the opening of a breast of 12 feet high grade copper ore.

California capitalists are prospecting with diamond drills for coal near the Gila river, east of Solomonville. Should they succeed, it will revolutionize copper mining about Clifton, Morenci and Globe and greatly cheapen the cost of reducing other ores in that region.

The Spangler mines, which are yielding rich ores, consisting of ten claims, are six miles from Garden station. There has been considerable development work done. About 200 tons of ore have been milled. There are seventy-five tons of second grade ore on the dumps. A clean-up of eight tons of second grade yielded $40 per ton.

The Mammoth mine, near Tucson, started with fifty stamps last week. The tramway is 2¾ miles in length. The double compartment has a depth of 600 feet. There are 4325 feet of drifts. The ore body is 52 feet wide. The mine has produced about 200,000 tons of ore. It is producing 175 tons of ore per day.

The Mohawk Co. is running thirty stamps. The workings have reached 300 feet in depth. In the 300 level the ore is 23 feet wide.

MEXICO.

Two Republics: Thirty miles southeast of Hermosillo, in Prietas district, are situated the Grand Central and Colorado mines, purchased a year ago by an English company for over a million dollars. Englishmen are said to be negotiating for the adjoining mines, the Mina Prietas and Crestone. Both combinations have mills, each treating about 160 to 180 tons of ore per diem. The ores of these mines run from one to three ounces in gold per ton.

News comes from the Sahuayacan gold mining district that two mines are in operation there, employing 100 men. A third is not operated for lack of machinery. Sahuayacan is 350 miles west of the city of Chihuahua, near the dividing line of Sonora and Chihuahua.

Jones & Shankland, representing Kansas City capital, purchased a half interest in a placer tract near Alamos, Sonora, for $10,000 gold. They will install machinery to lift the gravel and water. The water course will be changed and the machinery will be of large capacity.

On the upper Yaqui near San Antonio F. J. Toussaint, Gen. Mgr. Yaqui River M. Co., has a concession of forty miles of river and one-third mile of bank on each side. A dredge has operated satisfactorily for nine months. Another dredge is to be purchased at once of 2500 yards capacity each twenty-four hours. Mr. Toussaint has started for San Francisco.

The Kansas City Smelting and Refining Co. is building a smelter at Villa del Carmen, Coahuila, for treating gold, silver, copper and lead ores, with a capacity of 100 tons a day.

The Zaragoza mine at Suaqui Grande shipped nine bars of silver bullion 950 fine, weighing seventy-five pounds each.

Wadsworth & Wilbur have taken a bond on the Sevillano mine near Willard station for $12,000 gold.

The Copper Queen Co. commenced work on the reduction plant to work the ores of the Nacosari mines. Eventually the plant is to reach a capacity for handling 1000 tons daily. There are 100 men working in the mine on development and a large body of fair grade copper ore has been developed.

LOWER CALIFORNIA.

San Diego *Sun*: A strike is reported in the Cristo mine at Jacalitos of a vein 4½ feet wide, the ore running $200 to the ton. Three tons netted $625.

The Trinidad M. & M. Co. is a new company about to begin operations at Jacalitos, forty miles from Ensenada. The company is composed principally of owners of adjacent properties in the district, who consider it advantageous to concentrate the expenditure of capital. The officers are: C. B. Richards, president; O. J. Crewe-Read, vice-president; L. R. Works, secretary; L. A. Blochman, treasurer. The capital stock is $400,000.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Wm. Nolden and C. Kaber, in the Aureole mine, near Oleta, Amador county, to deposit tailings in Deadman creek, and from George Beattie, in the Beattie mine, at Georgia Slide, El Dorado county, to deposit tailings behind the dam of the Gold Bug mine, in Canyon creek, gives notice that a meeting will be held at room 59, Flood building, on April 11, 1898, at 1:30 P. M.

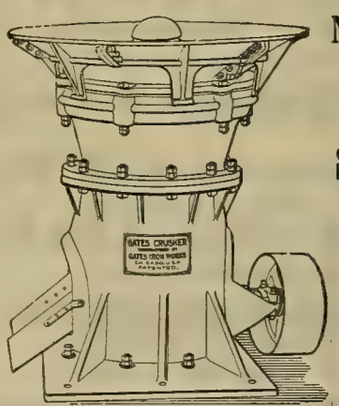
Works.....Cors. Bay, Kearny and Francisco Streets.



MINING AND MILLING MACHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

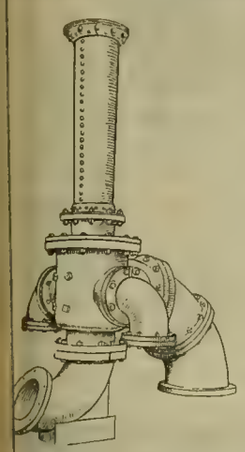
PATENTS



DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, March 31, 1898.

General trade has been fair for the season, although some lines report a falling off in the volume of goods going out. The dry weather scare is making dealers pursue a conservative course in buying. It is conceded by the more conservative in trade that crop damages by frost and dry weather have been exaggerated, and that the outturn of fruits will be fully up to last year's, but cereals, hay, beans, etc., will be less. In April there will be heavy buying for shipment to points on the upper tributaries of the Yukon river. It is the opinion that these purchases will aggregate over 30,000 tons of goods. Mining implements will be bought in increased quantities. There is considerable buying for shipment to Siberia. One vessel is loading for the Amoor river and three or four others will be dispatched in April. This trade promises to increase in the future.

In the local money market there is nothing to report. The demand for funds is light, which makes gilt edge paper sought by banks. City collections are said to be close, but country collections are fully up to former years. The opinion prevails that the demand for money will be light throughout the spring and summer months in the absence of any speculative movement. There will be heavy disbursements in this city in April and May by dealers and large incorporated companies going into business in Alaska. There is one company alone that will forward 15,000 tons of goods. These disbursements, together with heavy remittances of gold bullion from the Yukon and its tributaries, will add very materially to the large supply of moneys in bank. The East reports that the flow of gold from Europe to this country continues heavy, and it looks now as if the aggregate since February 25 will reach fully $50,000,000 by the last of April, unless the premium on gold in Europe should advance to such figures as to make it a losing game to bring it in.

New York Silver Prices.

NEW YORK, March 31.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	25 9-16	55½
Saturday	25 9-16	55½
Monday	25 9-16	55½
Tuesday	25 11-16	55⅝
Wednesday	25 11-16	55⅝
Thursday	25 11-16	55½

	Copper.	Lead.	Iron.	Tin.
Fri.	11 87½@12 00	3 75	9 75@12 00	14 35
Sat.	11 87½@12 00	3 75	9 75@12 00	14 30
Mon.	11 87½@12 00	3 72½	9 75@12 00	14 30
Tue.	11 87½@12 00	3 72½	9 75@12 00	14 27½
Wed.	11 87½@12 00	3 72½	9 75@12 00	14 27½
Thur.	11 87½@12 00	3 72½	9 75@12 00	14 27½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.82
London Merchants	$4.81
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	55½
Mexican Dollars nominal	44½@45

SILVER.—The market has been steadier the past week with a slight advance towards the close. The East reports a continued fairly free outward movement. English advices state that the call seems to be improving for shipments to the East Indies. It is stated that there is a strong probability that no move will be made to change the present status of silver in India either by imposing a higher import duty or establishing a gold standard. The demand for silver for China is light, here at the East and in Europe. There is only a normal call from other demand sources.

MEXICAN DOLLARS.—The market is very dull and no improvement is looked for until the new crop tea and rice seasons open in China.

COPPER.—The market continues to hold strong in all positions, at the East and abroad. The consumption is simply enormous compared with that half a decade ago. This year promises to be largely in excess of 1897, which was the largest in the history of the trade. The production of copper in the United States is increasing. It is stated that Arizona's outturn last year was 25 per cent over 1896 and this year's promises to be fully 50 per cent more than 1897. There was received from Seattle the past week 1287 ingots.

Our market is quoted as follows:

Ingot casting, jobbing	13¼@—
Ingot " wholesale	13 @—
Sheet copper	16¾@—
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—Our market is fairly firm for pig, but weak for plate, owing to competition between American manufacturers. The East reports fairly steady markets.

The market is quoted in jobbing lots as follows:

Pig	4 75	@	5 00
Sheet	....	@	6 50
Pipe	5 30	@	5 80

LEAD.—There is a fair demand, both here and at the East. Any improvement in the Eastern demand is met by a slight stiffening in prices, which shows that the market is well in hand.

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

QUICKSILVER.—There is a fair demand for both home and shipping. Exports the past week included 200 flasks to the west coast of Mexico.

Our market is quoted at $40 for domestic consumption and $36@37 for export to the west coast of Mexico.

IRON.—The market is steady to firm for foreign, but easy for American. Poor crop prospects for wheat in this State are against vessels coming here at low outward charters, consequently slightly more freight has to be paid. The East reports active but easy markets.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—There is no perceptible change in cargoes in any position. Poor prospects for the wheat crop in this State are against cheap coal charters. It is the belief that domestic coal will rule firm. The Oregon Improvement Co. is to be reorganized and its coal mines worked more energetically. Receipts of coal for the week ending Tuesday were as follows in tons: Puget sound, 6700; Nanaimo, 5640; Coos bay, 1015; Comox, 1250; total, 14,605.

Wellington	$10 00@— —
Greta	6 50@— —
Nanaimo	8 00@— —
Gilman	6 00@— —
Seattle	6 00@— —
Coos Bay	5 00@— —
Cannel	10 00@—
Egg, hard	13 00@— —
Wallsend	9 00@— —

TO ARRIVE—CARGO LOTS.

Australian	6 25
Liverpool Steam	7 00
Scotch Splint	— —
Cardiff	— —
Lehigh Lump	12 00
Cumberland, bulk	9 00
Egg, hard	10 50
West Hartley	7 25

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

POWDER.—The market is strong, with a free movement reported.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

PLATINUM.—The market is steady. Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 per ounce.

ZINC.—The market is firm. Our market is quoted at 10@15c, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 45@50c per pound for ingots.

BORAX.—The market is strong at full figures.

The market is quoted as follows:

Refined, in carload lots, in barrels	7¼
Refined, in carload lots in sacks	7
Powdered, in car lots, in barrels	7¼
Concentrated, " in sacks	6¾

Chemicals.

There is nothing new to report in our market. The demand is restricted largely to small jobbing lots, which are still met in nearly every line by purchases made last year. The East reports quiet markets, with no changes in prices along the line.

CYANIDE OF POTASSIUM.—The market is steady. Our market is quoted for chemical pure, 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm. We quote in a jobbing way at 1¼c per lb for 66%.

NITRIC ACID.—Our market is reported firmer from store at 6¼@7c per pound in carboys.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

BONEASH.—Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is firm at full figures.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is firm.

We quote our market in a jobbing way at 5c per pound.

BISMUTH.—The market is barely steady. Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (Le Blanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady. We quote in a jobbing way at 70@75c per pound.

Mining Share Market.

SAN FRANCISCO, March 31, 1898.

The market went off slightly under the lead of Sierra Nevada the forepart of the week under review, which sold down to $1.50. At this figure there was quiet but stronger buying, which stopped the decline, and caused a firming up; but the rest of the list only steadied up. There was a gradual appreciation until Sierra Nevada sold quite freely at $1.90 and $1.95, with a few straggling offers at $2. The other shares did not advance much, which makes dealers rather skeptical of much of an advance, at present, over that figure, although bull points are out for $2.50 a share. The improved price is said to be due to air connection in the upraise in that mine. This connection, it is claimed, admits of a free flow of pure air, which will allow exploiting the ore found on the Riley tunnel level, besides admitting more expeditious work in pushing that tunnel to the west. The work in several other mines on the Comstock lode ought to begin to attract attention before long, yet the market, before anything worthy of special mention is struck, is liable to go off, particularly the prices of shares that have advanced the most. This decline is liable to cause outside selling and a better concentration of shares. It is thought that if it does not bring about this desired result, then the work will be delayed and assessments levied, which will do the work. Of course, we are not in position to verify this belief, and it may be founded on the way it has been done heretofore. There is more quiet talk of draining the mines, with the view of resuming deep mining; but it is not at all likely this will be undertaken until some time in 1899, and in the meantime quite an upmove can be made, if desired, on ore developments above the Comstock tunnel level, for levels above the tunnel are by no means exhausted of the possibility of uncovering two or more large bodies of ore. This is made the more certain by reason of such a large area of virgin ground having been drained to the west by running west crossdrifts which tapped the large reservoirs of water in that direction, which years ago stopped work at a depth on the gold-bearing lode to the west. But it must not be forgotten by enthusiasts that even when ore is struck it will take time to put the mine in working condition for developing and extracting. The shifting character of most of the ground on that lode compels that man-escapes and a thorough system of ventilation be made before prospective work on the ore is undertaken, so as to guard against accidents met with in years gone by.

The market was strong and higher to-day for Sierra Nevada, with sales at $2 25. The entire line, but particularly the northenders, are firmer in sympathy. The advance in Sierra Nevada is said to be due to an improvement. It is reported on the street that in Ophir a diamond drill will be run to the west on the 1000-foot level. This ought to improve the shares in that mine. Contracts are being drawn up by the Comstock Tunnel Co. and the mines on the Brunswick lode, by which the mines there can be worked on that level, which will give interest to that lode, as the mines can be worked to much better advantage, and if good ore is found on that level then the mines on that lode ought to forge to the front, as a good investment proposition. Milling tests of Comstock ore make it a certainty that concentration is the best—a larger saving can be made by it and the ore milled at $3 a ton, instead of $7, as now charged. This method, we understand, is to be adopted there.

Official letters from the superintendents of the Comstock mines continue to be devoted to distances run and in some instances from points so worded that even a well-informed mining man might be deceived as to their exact location, which places outsiders at quite a disadvantage. As an instance, the following is an excerpt from one of the official letters filed this week: "From the incline upraise No. 1, at a point 60 feet above the sill floor of this level, from the south drift which skirts the footwall, at a point 178 feet in from its mouth, from the top of the upraise carried up 49 feet, from the south drift 100 feet in from its mouth, the upraise has been carried up 10 feet." This is about as clear as muddy water to the average operator, but it is only justice to say that outside operators do not care for ore or anything else—all they want is an active, fluctuating market, which makes it possible to draw out some money on their ventures. In Utah work is still continued in the northwest drift. It is in 72 feet feet and shows harder porphyry, with clay serpentine. Since the official letter from Sierra Nevada was filed advices have been received that the upraise 700 feet in from the mouth of the Riley tunnel has made connection above. This will admit of more active work on that level in the course of one or two weeks. They are still driving ahead in the north drift on the 900-foot Union shaft level. In Union work is confined to pushing ahead west crossdrift No. 2 on the 900-foot level. The material passed through does not show any change. They are still driving east on the 1000-foot level in Mexican. It is in about 870 feet. It is in porphyry showing clay seams.

In Ophir they are in 1000 feet in the west crossdrift on the 1000-foot level. The material is more favorable, but it is too soft to start a drill to run in several hundred feet to see what is ahead. The work on the Central tunnel level is to the west. No change is reported. In Andes they are still going west on the 175-foot level. The letter from the Con. Virginia reports they are still drifting east from points above the 1550-foot, 1650-foot and 1750-foot levels. A few tons of fair ore is taken out in the east crossdrift run above the 1650-foot level. In Gould & Curry they are still crossdrifting to the east from the 800-foot Bonner shaft level. In Savage they are still cleaning out and repairing main west crossdrift 190-foot level. No work in Hale & Norcross. Slow work is being made in repairing and placing timber below the 1100-foot level in the main incline in Chollar. They have stopped work in the winze from the 100-foot level and resumed work in the west crossdrift. They are crossdrifting to the west on the tunnel level so as to strike and prospect the ore found above. In Potosi the work is jointly with Bullion in the south drift. In Bullion the old Crœsus shaft is cleaned out and retimbered to a depth of 210 feet. In Alpha they are cleaning out and repairing the east crossdrift on the 500-foot level. In Con. Imperial the west crossdrift from the surface tunnel is out about 550 feet. No change is reported. A strong flow of water continues to be reported in the joint Confidence-Challenge-Con. Imperial west crossdrift. Some necessary repairs are being made. Nothing new comes from Yellow Jacket. No change is reported in the work in Belcher. About sixty tons of fair grade ore are raised a week. It assays about $25 a ton. Connection has been made on the upraise from the 830-foot level of Crown Point with the 700-foot level of Belcher. This admits of work being done to much better advantage in both mines. They are extracting a few tons of ore from the 900-foot level in Overman. They are still upraising from the 1100-foot level in Caledonia. They are raising about five tons of fair grade ore, assaying about $32, a day in Alta. The mine is reported as looking well. Owing to water coming in, it is said they stopped sinking the winze in Justice. When discontinued it was looking well. Work will be resumed when the flow abates.

From the Brunswick lode our advices are practically unchanged. In Occidental it looks as if they are developing a proposition which, when in order, ought to make the mine a dividend-paying proposition. On the 550-foot level they are still driving west. The east crossdrift No. 3 on the 650-foot level ran into a ledge which crosscuts 30 feet wide, which assays about $14 gold. This will pay the company, as it owns its own mill. On the 750-foot level they are still paralleling the ore found on that level. No change is reported in Chollar. The work is chiefly repairing. Incline shaft No. 1 is down 1165 feet. The work in Potosi is said to be looking well. From Savage, Gould & Curry, Best & Belcher and Con. Virginia no change is reported in the work or material encountered.

The following illustrates the changes of the week:

Assessment Notices.

CHURCH GOLD MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, El Dorado, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 23d day of March, 1898, an assessment (No. 1) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room 15, Nevada block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 23d day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. P. SWAIN, Acting Secretary.

Office—Room 15, Nevada block, San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING Company.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of March, 1898, an assessment (No. 13) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 11th day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, sixth floor, San Francisco, California.

MARINA MARSICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of March, 1898, an assessment (No. 13) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of March, 1898, an assessment (No. 45) of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 28th day of April, 1898, at 11 A. M., to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Room 22, Nevada block, San Francisco, California.

TUBER MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, Panamint district, Inyo county, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 22d day of March, 1898, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of May, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 26 day of June, 1898, to pay the delinquent assessment, together with the costs costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

NORTH BLOOMFIELD GRAVEL MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, North Bloomfield, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 25th day of February, 1898, an assessment (No. 50) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 27th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of March, 1897, an assessment (No. 83) of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1898, shall be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 10th day of May, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

KATE HAYES MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, North San Juan, Nevada County, California

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1898, an assessment (No. 6) of one dollar ($1) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 26th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquence in the above assessment notice has been postponed to March 12th, 1898, and the day of sale to MONDAY, April 4th, 1898.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

RICHMOND GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of March, 1898, an assessment (No. 2) of 1 cent per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 406, No. 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

L. R. TUTTLE, Secretary.

Office—Room 406, No. 328 Montgomery street, San Francisco, California.

·Lunkenheimer's·

Double Disc Gate Valves

Are perfectly constructed, compact, durable and made of gun metal (U. S. Government standard). They outlast and outwear all other makes. Made in two weights from ¼" to 3" screw and ⅜" to 3" flange ends for 175 and 350 lbs. working pressures. Satisfaction guaranteed. Specify "Lunkenheimer" make. None genuine unless name is cast in body. Supplied by dealers. Catalogue of up-to-date brass and iron specialties free for the asking.

THE LUNKENHEIMER CO., Cincinnati, Ohio, U. S. A.,
SOLE MANUFACTURERS,
26 Cortlandt St., NEW YORK.+BRANCHES:+35 Great Dover St., LONDON, S. E.

Weber Gasoline Mine and Mill Pumps

And in accordance with law, and an order from the Board of Directors, made on the 19th day of January, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, room 44, Phelan building, San Francisco, California, on MONDAY, the 4th day of April, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

DELINQUENT SALE NOTICE.

FALL RIVER CONSOLIDATED GOLD QUARTZ Mining Company.—Location of principal place of business, San Francisco, California; location of works, Plumas County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 16th day of January, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
L. Cassel	42	500	25 00
L. Cassel	46	750	37 50
L. Cassel	48	2	10
H. W. Brunning	49	1,000	50 00
J. Pilger	61	1,250	62 50
H. Meyer	26	1,111	55 55
H. Meyer	27	1,111	55 55
H. Meyer	28	1,111	55 55

And in accordance with law, and an order from the Board of Directors, made on the 15th day of January, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, 313 and 315 Front street, San Francisco, California, on THURSDAY, the 21st day of April, 1898, at the hour of 3 o'clock P. M of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

ADOLPH LORSBACH, Secretary.

Office—313 and 315 Front street, San Francisco California.

BARGAINS IN DYNAMOS, ENGINES, ETC.

DIRECT CURRENT DYNAMOS of 55, 150, 270, 350, 700, 725, 800, 810, 900, 1075, 1350, 1610 and 2500-light capacity. ALTERNATING CURRENT DYNAMOS of 750, 900, 1300 and 2000-light capacities. ARC DYNAMOS—20, 24, 30, 40, 50 and 60-light, both 1200 and 2000-candle power. ENGINES—12, 50, 75, 85, 100, 115, 125, 150, 175 and 200 H. P. BOILERS—50, 100, 250, 375 and 500 H. P. HEATERS—150, 1000 and 2000 H. P. STEAM PUMPS—All sizes.

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leibers.

—MANUFACTURERS OF—

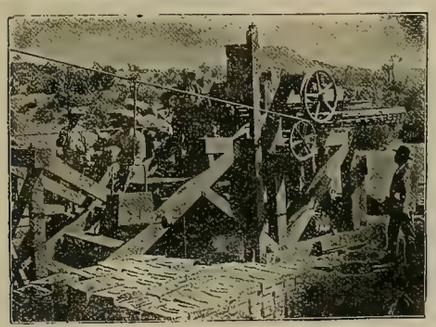
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

Stands pre-eminent for the transportation of Ore, Fuel and other materials over mountainous and rugged country.

Parties desiring to remove large quantities of Sand, Gravel, Earth, Ore, Rock, to construct Dams, Levees or Embankments, etc., can do most efficient work at less cost by the

Hallidie System of Ropeway Transportation

Than by any other known system.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace): The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

Electric Installation in a Factory.

FIG. 5.—ASSEMBLY ROOM MOTOR.

The idea that electricity is a mysterious agent, with the workings of which only a few accomplished engineers are familiar, is dying out. With electricity the generating plant can be confined to a small building removed from the factory, or the power may be brought from the central station miles away; each separate machine may be driven by its own motor, or one motor may drive a section of shafting of any length; there are no idle pulleys or shafting to keep in motion and each machine thrown off diminishes the load on the motor and consequently the demand on the source of power—in other words, the consumption of power is proportional to the load. The speed of machinery driven by motors is constant and reliable, and, as there is no heavy engine, there is no vibration. This allows of a more finished product, as well as an increased output without increase in the plant. The motor demands no floor space. It may be hung, inverted, from the ceiling, be slung from it on a platform, be placed on a shelf, or attached to the wall. Two of these positions are shown in the illustrations. In the third the motor is placed on the otherwise unused cover to a stairway. One of the best examples of the advantages of electric drive is to be found in the factory of the Miami Cycle and Manufacturing Company at Middletown, O., where 1200 bicycles are built each week and 600 men are employed. In this case the best results have been obtained by connecting each section of shafting to its own motor. The factory is a three-story-and-basement brick building on the line of the Cleveland, Cincinnati, Chicago and St. Louis railroad, running between Cincinnati to Cleveland. It is about a mile distant from the station of the Middletown Electric Light and Power Company, from which the electricity is brought over wires strung on poles. It reaches the factory at 1000 volts and passes into six 40 H. P., one 20 H. P., and two 10 H. P. transformers, which reduce the pressure to 115 volts. The large transformers furnish the current for the motors; from the three smaller the lighting currents are run. The largest room in the factory is the machine and tool room, Figs. 1 and 2. This contains three lines of 3-inch shafting, each 210 feet long and each connected to a 20 H. P. motor. From the shafting belts are dropped to the different machines—lathes, drills, shapers, milling machines, emery wheels, planers, grinders, gear cutters, punch presses, hub machines and screw machines, in all eighty-four machines. In addition to these, an oil separator, two oil pumps and a high-pressure blower for the forges in the blacksmith shop are also driven by the motors. By means of friction clutch pulleys the three lines of shafting may all be connected together. The twenty-six machines in the drill room, Fig. 3—drills, grinders and milling machines, as well as a band saw, a circular saw and a lathe in the pattern room—are driven by a 10 H. P. motor. Another 10 H. P. motor operates all the machinery in the frame department.

FIG. 4.—ASSEMBLY ROOM.

The double polishing frames in the polishing room require two 30 H. P. motors. These are boxed in and are belted to two lines of 2½-inch shafting, each 93 feet long. Another 30 H. P. motor in this room drives a large suction fan which takes up the dust from the polishers. In the plating room two plating dynamos are driven by a 5 H. P. motor, and another 5 H. P. motor in the assembly room drives 110 feet of 2-inch shafting for a number of small machines and operates in addition a three-ton elevator. The electric system employed is the monocyclic system, an alternating-current system introduced by the General Electric Company, by which motors and lamps may be run from the same circuits, change of load on the motor circuits not interfering with the light of the lamps. The motors are induction motors, with no commutator, brushes, collector rings, or moving contacts.

Three small wires fastened to three binding posts bring the current to the motors, which run at a constant speed. They demand no attention beyond an occasional oiling and are for the greater part of the time called upon for much more power than that for which they are rated. As there is no jar on the floors from any steam engine, heavy pulleys and belts, all the machinery runs without vibration, and the manufacturers assert that to the absence of vibration and the constant speed of the motors, the satisfactory operation of their plant and the finish of their product is almost entirely due.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

EDITORIAL.—Electric Installation in a Factory, 389. A Question Answered, 390. Miscellaneous, 390–91.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 397–98–99.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 410.
MISCELLANEOUS.—Treatment of Slimes, 391. California Methods in Colorado; Annual Report of British Columbia Minister of Mines; Process for Utilizing the Waste Residue of Petroleum, 392. Gold Deposits, Geology and Geography of Alaska, 393. Drilling on the Mesabi Range, 393–94. From Arizona; Points for Prospectors, 394. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Paraffine Paint; Vitality of Dogs, 395. The Electro-Zinc Slimes Process; Working Out the Details; Making Blue Prints; Electricity in War, 396.

In the article on the Gates canvas plant on page 392, the scales to which the sketches are drawn are given incorrectly. They should read: For Fig. 1, scale $\frac{1}{4}$ in. to 1 ft.; Fig. 2, $\frac{3}{32}$ in. to 1 ft.; Fig. 3, $\frac{1}{2}$ in. to 1 ft.

The fact that the United States Circuit Court of Appeals recently decided, in the case of a "crooked vein," that if the apex of a vein or part of it crosses the end line of a claim and then passes out through a side line, but curves back again into the claim and crosses its other end line, thus giving the owners of the claim no right to any part of the apex which is outside of their lines, makes the Arizona *Republican* think that it was possibly with a view to avoiding the consequences of such a decision that a prospector posted on a round chimney of quartz a location paper giving notice that he claimed "this lode or lead of quartz for a distance of 1500 feet in a wabbling direction from this notice."

In line with recent suggestions herein, showing the advisability of renewal of work on the Comstock, those in charge have made some practical movements this week in connection therewith, which it is believed will result in the settlement of the long-standing differences between the mining companies and the Comstock Tunnel Co. It is understood that the latter company has considerable capital at its command, and in case of any feasible arrangement whereby work can be renewed, sufficient capital can be forthcoming to insure active operations. The movement means a good deal to that entire section, including claim owners in adjoining districts, namely Silver City and American Flat.

Invitations to send representatives to the International Mining Exposition, to be held at Salt Lake City, Utah, beginning July 6th, '98, have been received by the California State Miners' Association and Governor Budd. Considerable interest is manifested in this gathering and it is in order to have California properly represented by miners. Secretary Johnson writes:

The broad scope and practical character of the organization has aroused deep interest among earnest thinking men throughout the country, and the coming gathering is destined to be recorded as one of the most important events in the history of the mining industry. We earnestly desire the active participation of every State and Territory in the Union in its proceedings, and urge the importance of selecting men most truly representing such branches of the mining industry as are prosecuted in the State, or those who take special interest in the subject.

Every county mining association in the State should send its full number of delegates to this meeting; and were California represented by one hundred delegates it would be but proportionate representation and would inure to the benefit of the commonwealth.

The Downieville, California, folio of the Geologic Atlas of the United States is received from H. W. Turner of the United States Geological Survey. This is uniform with the rest of the series previously issued, as heretofore noticed, this being the fourth of the California series. The folio is 19 by 22 inches, stoutly bound, containing an explanation of the geological map of the United States, of which this folio forms one sheet, followed by the description of the geographical, geological and mineral resources represented in that particular sheet, in plain, terse language especially appropriate for the public. There is a large amount of valuable information in each of these sheets, any one of which may be procured from the United States Geological Survey at Washington upon receipt of 50 cents. In these topographical map sheets, the water features are in blue, the hills in brown and the roads and towns in black. Following this is the same basal map with the geological colors, entitled "Historical Geology Sheet," and following this the same basal map printed in colors, called "The Economic Geology Sheet," with special attention to gold, iron, etc.; following is a structure section sheet, showing in colors the under formations with the latest geological ideas of those portions of the earth's crust. This work is done admirably throughout and is a credit to the office from which it originates. It indicates that the appropriation is being wisely spent, the work being of practical value to the public. It illustrates one way in which the taxpayer, upon whom all the expense of these things falls, can get good immediate results from the use of his money. In this connection it may be said that under Director Walcott's supervision the United States Geological Survey shows gratifying interest in the mining industry, which is of course as it should be. Indeed, were it not for the mining industry there would be but slight excuse for the existence of the Government Geological Survey, and this fact seems to be thoroughly appreciated.

Recent issues devoted to Cripple Creek, Colo., Mercur, Utah, the Yukon region and elsewhere, up-to-date and promptly furnished, show that the Geological Survey realizes that the greatest value of such publications lies in their prompt appearance. It is to be noted in this connection that a systematic plan in relation to this work, so far as California is concerned, has not been practiced, either by the State or by the United States Survey. Some time ago the State Mineralogist very properly proposed that a systematic survey be undertaken by this State; but so far nothing has come of it, though nothing would be of more value to the mining industry of California and its prospectors. Our California county maps are good; such United States Geological Survey sheets as those already issued of the Jacksonville, Smartsville and Nevada City folios, and, last, this of Downieville, are of great value; but even these are not wholly sufficient for the needs of the miners to-day. This matter has been taken up by more than one State Miners' Convention; but so far nothing has come of it. Where the United States Geological Survey is in the hands of a director who evidently desires to bring his work in touch with the wants of the people, and where the necessity of the work suggested herein is conceded on all sides, it would seem as though something tangible should come of it. While it may be said that the Government is supposed to deal only on general principles, and that what is being done now in this State—mapping the entire Sierra gold belt and publishing it in such convenient and valuable form—covers its duty therein, and that to do more would be to encroach upon the business of the prospector and the engineer, yet the idea is to aid such men, as well as the ordinary prospector and miner, so that all alike may be benefited. The cost of these general atlases now being published is from $5 to $11 per square mile. That of the Nevada City special folio, covering an area of 35 square miles, upon which every detail of geological and mineral data was outlined, cost $280 per square mile. This State contains about 160,000 square miles. Of this area the United States Geological Survey has topographically mapped about 36,000 square miles; of this latter area about 16,000 square miles have been geologically mapped and 800 square miles published.

From Washington and Madrid come notes of war. There are things worse than war, for instance the supine cowardice in a man or a nation that holds nothing worth fighting for, and that is willing to bide in dishonor. And yet, as Sherman put it, "War is hell!" It lets loose havoc and waste, and entails destructive expense. It spoils many for subsequent usefulness and hurts the nation by perverting its standards; for the virtues of war are the vices of peace. War is abnormal and its existence, like mob law, a spasm of effort that is only permissible by extreme necessity. The great justification—in fact, the only justification of war—is that it is the natural and inevitable resort in the absence of an international court of appeal. The difference between individuals and a nation (which is an aggregation of individuals) is mainly this: Where individuals disagree they resort to courts for arbitration. The court's decision rarely satisfies the defeated party, and doubtless in a majority of instances, if the defeated plaintiff or defendant were able, he would upset the decision of the court; but that is the law and such decision settles the case. An appeal from that decision would arouse the latent power of the government which lies behind every judge's chair. But with nations, each one is a law unto itself and there is no court of final resort, nothing to appeal to, except force of arms. It does not follow that every judge's decision is right in the case of two individuals; nor does it follow that the result or outcome of every war is right; but yet there is nothing left when argument and diplomacy fail but to resort to armed force. Of the merits of the question there can be, from the American standpoint, little doubt. As an integral part of a nation we of this coast are greatly concerned; while we will know little of the actual shock of battle, the conflict materially affecting the Gulf States and South Atlantic coast, yet even more intimately than in the slow-going days of the civil war will we feel the actual contact of blows. The result commercially will be stimulating to some classes of business and depressing to others. To nearly everything related to the mining industry the war will be a stimulus. Already it is noted in advance that, as in the days of the civil war, the gold of this west half of America was needed to supply war's sinews, so in these troublous sunset years of the century the great basic industry of the nation will be a material factor in assured victory.

A Question Answered.

In an extended list of answers to questions asked this paper in the issue of March 26th appeared the following from a San Francisco subscriber:

Take a car with a truck under each end and the car running on a level. The brakes are applied to one truck only. In one case that truck is on the front end of the car; in the other case the car is going in the opposite direction, so that the truck with the brakes applied is on the rear end of the car. In which case, if in either, would the brakes be most effective in stopping the car? In other words: Everything else being equal, would the brakes on the rear end of the car be more effective than on the front end?

Under date of March 30th, E. W. Liljegran, ex-Supt. Le Roi mine, writes from Rossland, B. C., in answer as follows:

In reply to "A San Francisco Reader," asking which truck of a car is most susceptible for stopping a car by applying a brake to the front or rear truck, I would say that brakes applied to the front truck are the more effective. When a car is in motion, and anything is applied to check its speed, the momentum of the moving body will persist in continuing in that direction, with specific gravity drawing down, making it possible to throw or place all the weight of a car and contents on the front truck. This can be demonstrated by using a rather high car, with trucks close together, set in rapid motion, and apply a powerful brake to the front truck. The result will be that the total weight of car and contents will not only pass onto the front truck, but clear over it. In fact, the car will end over, which demonstrates that, in order to get the greatest amount of friction, the appliance must be where the greatest force exists.

I have employed brakes on mine cars for switch-

ng, which is done by using open switches and a separate clamp brake on each front wheel applied by a foot lever from the rear end of the car. A loaded car of about one ton capacity, on good track, with a grade of .0036% (= ¼ of an inch in 12 feet) will, with a start, develop speed, with the carman standing on the rear, and have complete control by sudden pressure on the left lever. The left front wheel is impeded by friction, causing it to crowd the left rail. If desiring to turn to the right, apply the right brake and thus switch either way. With a track on the above grade, an empty car is pushed up grade simply by the carman leaning his weight against the car, avoiding laborious pushing. In this way, a carman can accomplish a greater amount of tramming, which is what all managers desire—economy.

Treatment of Slimes.

The very extensive descriptions of everything connected with the cyanide process in this paper for the last six years have made it a repository of information thereon. Of late much of practical value is received from South Africa, where cyaniding is conducted on an extensive scale, and progressive experiments are in constant process of acceptance or rejection. Much space has been accorded the operations and comments of Chas. Butters. On Feb. 19th he delivered an address at Johannesburg on the treatment of slimes, of which the following is a condensation:

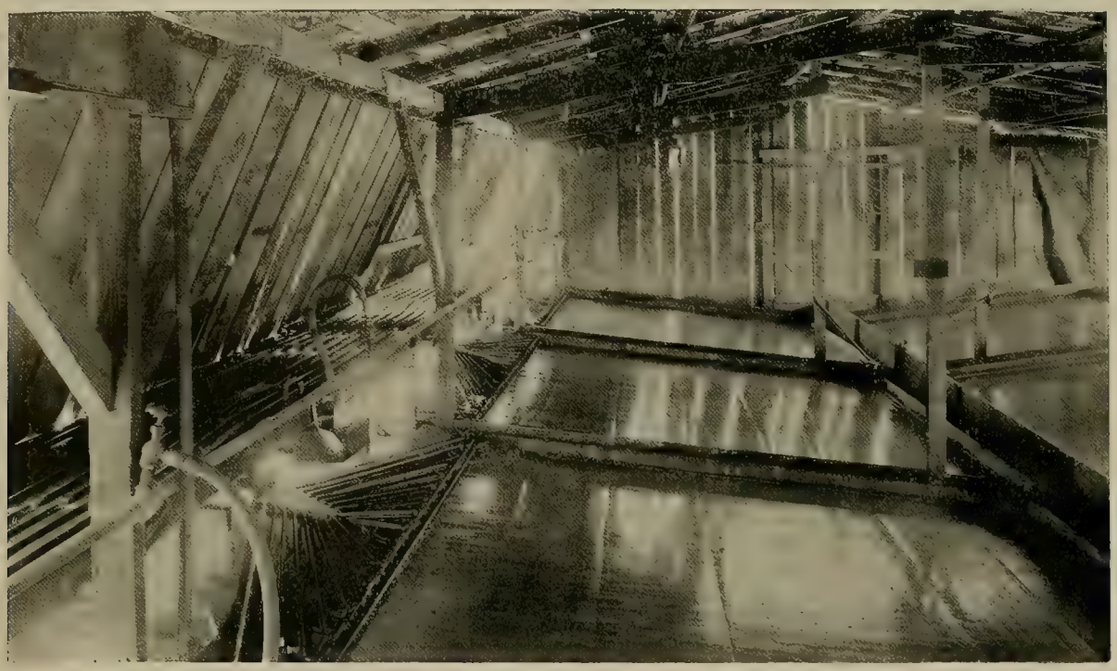
Concerning the solution of what is known as the 'slimes problem," or the economic treatment of slimes produced by battery crushing, the newness of the work and the special opportunities and facilities I have had for carrying it on to a definite result are my excuse for bringing this subject before you, having been specially engaged on the slimes problem for the past three years. At the last meeting of the Chamber of Mines the president took the opportunity of stating the fact that the treatment of slimes was now an *economic success*. A statement from such an authority as the president of the Chamber of Mines of the South African Republic upon a question of so much economical importance to the mining industry marks an epoch in the metallurgical world that is well worthy of our consideration. * * *

To take up generally some of the difficulties encountered in treating slimes, it was found that if they were allowed to be deposited in dams for a comparatively short time, even for a few days, decomposition of the pyrites took place, and the question of their treatment directly as received from the mill thus became a subject for study. These researches have successfully resulted in the working out of a practical method, which consists essentially in the coagulation of the slimes in battery water by means of lime, their concentration by spitzkasten, and final settlement in continuous overflow vats or pits. The coagulation of the particles in clayey soils in agricultural operations by the addition of lime has long been known and practiced, and the use of lime for the flocculation and precipitation of the slimes suspended in battery pulp is but another adaptation of the same principle. The spitzkasten offered a ready means of making a partial concentration, and this was first carried out on a large scale by the erection of a spitzkasten at the Meyer & Charlton, the concentrated slime pulp being then pumped to the central works of the Rand Central Ore Reduction Co. Pointed stone settling pits were used by Mr. Williams at the Crown Reef, but have been supplanted by large rectangular spitzkasten, in which the pulp is concentrated from about 2½ per cent of slimes to 7½ per cent or 10 per cent, whence it flows to the collecting vats for final settlement. These collecting vats have in some instances continuous overflow pipes; in other plants intermittent filling and settling takes place; in some cases settlement takes place sufficiently fast to allow clear water to run off through the decanter. These settled slimes, containing about 50 per cent of water, are now ready for treatment. Another great advantage is gained by the separation of the slimes from the plate water, inasmuch as the latter is at once obtained in a fit state for re-use in the mill, and can in some cases even be gravitated back to the mortar boxes without pumping. The enormous saving in pumping costs and the economy of water are evident. This service, rendered by the cyanide works to the mill, illustrates the close relation of the various branches of gold-winning to each other, and emphasizes the need for the cordial co-operation of the mill and cyanide managers for obtaining the best possible results.

We have, so far, automatically and continuously collected the material from the battery water as it was delivered; but at this point the continuous operation of the slimes process stops, and, I am at present inclined to think, *always will stop*. The problem of extracting the gold from this partially liquid, sticky, clayey mass is now before us, and I will endeavor to lay before you some of the difficulties encountered and particulars of the manner in which they have been overcome.

In slimes we found a substance which could not be leached, or through which the solution would not percolate, but which we were obliged to wash by decantation. Washing by leaching or percolation means that one to two volumes of solution will dissolve and wash out a satisfactory percentage of the gold, and the final washing out of the dissolved gold is easily effected, because, in leaching, one solution displaces more or less completely the solution which has gone before it; and thus by successive washes, after having dissolved the gold, you *finally* obtain a wash which is comparatively free from gold. The sum of these successive washes does not exceed one and one-half tons of solution to a ton of ore, and the amount of solution which the ore will finally retain as moisture will not exceed, on an average, 14 per cent. With decantation, however, the washing of the material takes place by dilution, one wash does not displace another wash, but simply mixes with it; and, since the amount of solution or wash which this clayey mixture retains is from 40 to 50 per cent, the amount of dilution necessary to extract a satisfactory percentage of the gold necessitates the use as washes of from six to eight tons of liquid per ton of slimes treated. Consequently, in sand treatment, where 4 dwts. are extracted from one ton of sand, with two tons of solution, the average value of the solution is 2 dwts.; while in slimes treatment, if 4 dwts. are extracted from one ton of slimes, the average value of the solution would be 12 grains. In the case of the sands, the value of the first solution leached off might easily be 6 dwts., while with slimes the first solution would probably not be over 1 dwt. The result is that in the latter case you have a very large volume of much diluted solution to deal with, and at the same time the slimes retain as moisture nearly their own weight of solution. In order, therefore, that slimes may be economically treated, it is necessary to use a very dilute solution of cyanide, so that too much cyanide may not be lost with the residues when discharged and that too much may not be decomposed during treatment. How to obtain gold from this solution presents an entirely new problem to the metallurgist. Dilute solutions containing from 0.01 to 0.001 per cent of cyanide and from 6 to 24 grains of gold per ton had not hitherto been successfully handled.

A short review of the various methods that were tried at the Robinson plant with the object of overcoming these difficulties may be of interest at this point. First, let us discuss the solution and washing out of the gold: one of the most obvious methods to overcome the difficulties connected with this enormous volume of solution was to attempt the washing out of the gold by a smaller volume of solution than is ordinarily employed when working by decantation. At the Robinson a combined system was worked out—suction, leaching and decantation. The slime pulp, after being agitated sufficiently long to dissolve the gold, was run down upon a circular filter, contained in a 24-foot vat, with a raising and lowering stirring gear; while decantation was taking place on top, suction was applied below the filter cloth, and by this means about ten tons of slimes would be settled, decanted and sucked dry by a vacuum pump down to about 28 per cent of moisture, and would remain on the filter cloth as a layer 6 to 8 inches thick. The mass was then left in a tough, leathery condition—so tough, in fact, that it could be rolled up on the filter. Fresh solution was applied, and the paddles gradually lowered whilst revolving at the rate of about sixteen revolutions per minute, so that in half an hour the slimes were washed into a pulp again; after further dilution, settling and decantation would proceed, and the pulp be sucked dry by the vacuum pump a second time. This gave a smaller volume of solution to deal with, and less gold in the slimes after each settling. The wear and tear, however, on the surface of the filter (which necessarily had to be composed of fine fabric in the shape of a double thickness of cotton twill, supported on a cocoanut matting) was excessive. The cost of keeping the suction pumps in order, and the power and attention they require, made this method fairly expensive; the extractions obtained, however, were satisfactory. Such a process for rich material running 15 dwts. or more to the ton is well adapted to give a high extraction, and when dealing with such high-grade material the cost would not be relatively high.



The process adopted by Mr. J. R. Williams at the Crown Reef, known as "natural settlement," and afterwards adopted at our Robinson works, is now the method generally used; in other words, the combined process of decantation and leaching by means of vacuum pumps has been found too expensive for the treatment of the low grade slimes produced on these fields—hence we have been obliged to adopt the principle of natural settlement. Decantation, as ordinarily practiced in large, shallow vats, means that at least a ton of solution is thrown away with every ton of slimes. To reduce this large amount of solution thrown away we have erected at the Central Works of the Rand Central Ore Reduction Company the two largest vats in the world, each being 50 feet in diameter and 16 feet deep, with a capacity of nearly 1000 tons. These tanks, being discharged only once a week, accumulate in the interim 9 feet, 10 feet or 11 feet of settled slimes, equivalent to from 450 to 600 tons of dry slimes. It has been found that, by filling them gradually and allowing them to settle for about a week, the pressure exerted by the great depth of settled slimes has the effect of reducing the average moisture to about 40 per cent, which means less solution thrown away. Moistures as low as 34 per cent and 38 per cent have been obtained, and I think that in the future very large and very deep tanks will be utilized for the natural settlement of slimes. The settling capacity of these large vats has of late been considerably increased by the use—suggested by Mr. W. R. Dowling—of a "sub-level delivery" of the diluted pulp introduced into them. In place of allowing the stream of pulp from the launder to fall upon the surface of the liquid in the vat, thereby causing considerable disturbance and involving alternate filling, settling and decanting, the pulp is now carried half way to the bottom of the vat by means of a section of large-diameter pipe, open at both ends, and suspended above the center of the vat. As a result, the slimes, having less distance to settle, do so more rapidly; and, the surface of the liquid being unruffled, clear solution is always available for decantation or overflow at the top, so that its removal can proceed simultaneously with the pumping into the vat of diluted pulp. In the removal of the settled slimes from these vats the method of "hydraulicking" has been adopted. That portion, resembling puddled clay, of the settled mass of slimes which is too thick to flow is washed out through a door in the bottom of the vat by means of a jet of water delivered from a pressure pump through a hose and ¾-inch nozzle at a couple of hundred pounds pressure per square inch. This rapidly disintegrates and carries away the sticky mass, and in this manner 500 tons weight of slimes can be discharged in three hours with very little labor or cost.

The concentration of the solution, as regards its gold contents when decanted, was first successfully introduced by Mr. J. R. Williams at the Crown Reef plant, in order to reduce the amount of solution passing through the precipitating boxes. Naturally, when a given amount of gold in solution is obtained from the slimes per twenty-four hours, if you can concentrate this amount of gold into a small volume of solution, a small precipitating capacity is required. For these reasons Mr. Williams introduced the system of double washing—that is to say, the first solution that is applied to the slimes after decantation is not clarified and passed through the precipitation boxes, but is run into what is called an "intermediate tank" and then pumped up for use again upon a fresh charge of slimes. After this second decantation it is run through the clarifying apparatus to the boxes for precipitation. The settled slimes are then re-pulped with an equal volume of solution from the precipitated sump—that is, solution which has passed through the precipitation boxes. Theoretically, one could carry on the enrichment of the unprecipitated solution until it was equal to the value of the slimes, but in practice it has been found that the first wash which has not been precipitated and the second wash which has been precipitated (two washes altogether) make the simplest and most perfect system. This idea was carried out on tailings at the first cyanide works I constructed in this country—namely, the Robinson cyanide works. I attempted to enrich the solution by passing the liquor from the leaching vat through another charge before allowing it to enter the precipitation boxes, but this practice was not found economical. Cyanide solutions leached from tailings are sufficiently rich to pay for immediate precipitation. As I have already stated, their value may be 6 dwts. or more per ton. Taking po or slimes assaying 2½ dwts., from which possibly 2¼ dwts. may be dissolved by eight volumes of liquor, the resulting solution would carry about 7 grs. per ton if it contained absolutely no gold when added; with practically perfect precipitation its value would be about 8 grains. By applying this a second time before precipitation a value of about 15 grains per ton could be obtained, while with slimes running from 5 dwts. to 6 dwts., concentration takes place up to about 1¼ dwts. or 1½ dwts. Another point in favor of concentration of the solution is that the less solution you introduce into the precipitation boxes the less mechanically suspended slimes you carry into the box, and the less lime salts are deposited therein; hence the better is the precipitation and the less the gold in the by-products. Double washing means practically double the time of treatment that a single wash would occupy, which in turn means, for a given tonnage of slimes, double the number or double the size of the vats. And while theoretically it appears that we could concentrate the solution up to the value of the slime itself, practical considerations of the number of vats required and the number of operations to be carried on, the amount of pumping, and the care needed to watch the various kinds of solutions, bring the economical point down to that of a double wash. I am inclined to think that this system of double washing, as now adopted, will remain a feature of the slime process.

(*To be Continued.*)

California Methods in Colorado.

In the issue of the 12th ult. was an illustrated notice of the Smuggler-Union mine, near Telluride, Colorado. Connected therewith is an enterprise which, having demonstrated its worth at the Kennedy mine, Amador Co., Cal., is now financially successful in Colorado. Early in '97 Kirby & Gates of this State built a canvas plant near the Smuggler-Union mill to treat the tailings.

THE GATES CANVAS PLANT AT THE KENNEDY MINE, AMADOR COUNTY, CAL.

The apparatus is operated on the assumption that the coarser portion of the pulp from the mill contains its value enclosed in grains of quartz in such a way that it cannot be recovered on his plant without further crushing. Primarily, he separates the coarse sand and saves the fine sulphurets, as noticed herein by W. S. Hutchinson. This separation of the coarse from the fine is effected in two "segregators," each constructed as shown in the sketch (Fig. 1). The pulp from the mill enters the distributing boxes, which have a bottom of sheet iron with ⅛-inch holes. These deliver the pulp in a shower to the separating box of the segregator. In this box the coarse sand settles, while the fine material is kept up by a rising stream of clear water, which is delivered at the bottom of the pipe just above the spigot. Sand and water escape steadily from this spigot, which is a ⅜-inch bushing of iron pipe in a rubber cork. The fine pulp overflows in a sheet over the end of the machine and enters a divided trough with twelve compartments, through which the pulp is distributed to the canvas tables. The plant has twenty-four working tables arranged in two rows of twelve, facing each other, and sloping together to the tails launders. In addition, two extra tables receive the pulp when it is turned off from a pair of the working tables for hosing off. The canvas of each table is 12 feet wide, 10 feet long, stretched upon a floor sloping 1½ inches to the foot. The arrangement of distributing troughs and tables is shown in the sketch plan and cross-section (Fig. 2). The device for receiving the tailings and concentrates at the foot of the tables is shown in Fig. 3. While pulp is running over the table the tilting tail (*T*) is turned so as to deliver into the tails launder (*L*). After washing, the tail is turned, as shown, to the right, and the concentrates are hosed into the launder (*C*), which is divided by a splashboard (*S*).

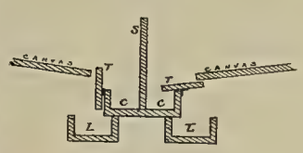


Figure 3.
SCALE 1 inch = 1 foot.

When the pulp has run on a pair of tables for an hour it is turned off and run to the extras. Clear water is turned on for a few minutes to partially clean the sulphurets caught on the canvas. The tilting tail is then turned so as to deliver into the heads launder, and the table swept off with a hose which throws a broom-shaped stream. These concentrates run to a settling box 2 feet by 12 feet by 2 feet deep. The overflow from this box goes to a canvas table and then to the tables which receive also the tails from the vanner mentioned below. The material settled in the tank has a value of about $30 per ton in gold and must be cleaned. It is, therefore, shoveled to a trough, whence it is washed by a small stream of water to a short, smooth belt and end-shake machine run with a very rapid shake, steep slope and thick pulp. Travel—1 foot in 11 seconds. Throw—$\frac{7}{16}$ inch. Shake—240 to 260 per minute. Slope—$1\frac{1}{16}$ inches per foot.

The tails go to the table which in turn discharges to two others in succession. The material caught upon these tables amounts to from two to three tons per month and has an assay value of about $60 per ton.

The flow of the pulp over the tables takes the form of a succession of waves. At the head of the table these waves have a length of five inches from crest to crest and at the foot of the table 12 inches. This does not indicate a corresponding acceleration in the velocity of flow at the foot of the table, but is caused by the retarding of one wave by the sand in front of it until the succeeding wave overtakes it, when they go on together. These waves travel from the top to the bottom of the table (a distance of 10 feet) in from six and a half to eight seconds, as measured with a stop watch, and the depth of the pulp, measured with a micrometer gauge, was:

	1 Foot from Head.	*1 Foot from Tail.*
Crest of waves...	.063 to .068 in.	.068 to .075 in.
Trough of Waves	.050 in.	.040 to .045 in.

The Smuggler-Union mill crushes about 200 tons of quartz per day, and from the Gates & Kirly plant are shipped six carloads of concentrates per month, averaging $70 per ton. When working at the Kennedy in this State, the fine sulphurets collected on the canvas plant were found to assay $10 to $15 higher than the mill concentrates. The mill tails gave an average assay value of $1 in gold. In passing through the segregator seventy tons of coarse sand were thrown away and twenty tons of fine slimes delivered to the tables.

The estimated amount of water used was:

	Miners' Inches.
Received with the pulp from the mill.....	1
Clear water used in the segregator.....	8
Clear water used in cleaning and hosing off.	1
Total	16

This was verified by measurements made by timing floats with a stop watch in the tails launder.

No. 6 canvas is used, which is renewed every eight months. During that time it is shifted every month, to bring the cracks of the floor in different places. Hot weather affects the canvas badly. The cost of the Kennedy plant was $2000.

SECTIONAL VIEWS OF GATES CANVAS PLANT.

FROM James Baker, British Columbia Minister of Mines, is received his annual report for the year 1897, of unusual interest and value, accompanied by maps and illustrations and conservatively compiled. From the elaborate tables it appears that the placer gold yield of the province for the year was $513,512. This placer gold contained from 10% to 25% silver. The quartz gold yield for the same time was $2,122,820, both increases over the net results of '96. Recommendation is made to require a certain amount of discovery work to be done within ninety days after date of location. There is a detailed description of the principal hydraulic mines, mainly in Quesnelle district, which are operated by successful California hydraulic miners on the same general principles, modified by location. Some of the best California inventions and practices are in satisfactory operation therein. There is considerable valuable descriptive matter, and several special articles of present interest. In the report is embodied an up-to-date list of crown grants issued for mineral lands for 1897, with the name, claim, district, name of the grantee, area, description and date. A report by Inspector Dick of the coal mines of the province completes the book of 640 pages, which is throughout commendably arranged and of more than ordinary value.

A PROCESS for utilizing the waste residue of petroleum by solidifying it for use as a fuel has been invented by a German chemist. The *Revue Scientifique* reports a recipe for the preparation: Heat, without contact with the air, or in superheated steam, ten parts of soda, ten parts of fatty matter, as palm oil, and eighty parts of petroleum. Boil for an hour at a temperature below the boiling point of petroleum. Large quantities of volatile oil are thus fixed by saponification, and when cool the mass is solid. There may also be mixed with it charcoal powder or dust. If less solid products are required, the grease is replaced by resin or resinous acids. Thus are obtained products containing more than 90 per cent of combustible and less than 5 per cent of fixed residue.

THE present assessment on the Bullion, Nevada, mine is No. 52. This is a Storey Co. property, worked continuously for over twenty-five years, which has never paid a dividend nor even running expenses. It is interesting to note under private management what fraction of twenty-five years such an untoward condition of affairs could exist. The matter is a monument to the possibilities of the assessment system.

THE dividend paid by the Calumet & Hecla Copper Company of Michigan on the 1st inst. aggregated an even $1,000,000. It is only a mining company that can declare such dividends.

Gold Deposits, Geology and Geography of Alaska.

NUMBER IV—CONCLUDED.

The richest gravels have been found in the Birch Creek and Forty-Mile districts. In the entire Birch Creek district, which lies south of Circle City, and on Miller, Glacier, Poker, and Davis creeks of the Forty-Mile district, near the international boundary, the bedrocks are always the quartzite-schists of the Birch Creek series, containing veins of quartz. The gravels rest, as a rule, directly on the schist, though in some cases, as on Harrison and Eagle creeks in the Birch Creek district, there is clay beneath the gravels, and the gold as a rule does not extend into the bedrock, but occurs chiefly at the top of the clay. Generally, however, the schist is rotted and reddened from oxidation for a few inches to several feet below the surface, and in this part the gold has settled into the cracks and joints. The clay gravels lie mostly next the bedrock, in an average thickness of perhaps 2 feet, though sometimes up to 10 feet, while the overlying gravels average 8 or 10 feet, with a maximum of 25 feet. In the gravels the schist is in quite large, flat fragments, and the quartz is in bowlders of varying size. The schist fragments lie flat, and are mixed with sand, showing that the sorting action of running water has not been carried far. In the concentrates from the sluice boxes the heavier minerals associated with the gold—galena, magnetite, limonite, hornblende, and garnet—are in each case such as are found in the neighboring schists, and the nuggets of gold often have pieces of quartz still adhering to them. All these facts are evidence that the gold is derived from rocks in the vicinity, and is not brought from a great distance, perhaps by glaciers, as some erroneously suppose.

The rocks of the Forty-Mile series in the Forty-Mile district, as already stated, form the west bank of Forty-Mile creek, and south of the South Fork cross the divide between Franklin gulch and Napoleon creek, where they are overlain by green slates of the Rampart series, which in turn are overlain by conglomerates of the Mission Creek series. In Franklin creek the bedrocks are marbles interbedded with mica and hornblende - schists; the gravel contains fragments of marble, quartzite, mica-schists, and vein quartz. At one point a quartz vein is found in the bedrock, and below it native silver has been found in the gravels, which apparently came from this vein. It is the schistose rocks that mostly carry the gold, as the marbles do not show much evidence of veins. In this gulch are two levels; the higher one, at the head of the gulch, had not been worked, while the pay gold had been found mainly at the lower level, near the mouth of the gulch.

Chicken creek, so called because its gold occurs in grains the size of chicken feed, drains a wide area toward the Ketchumstock hills to the southwest, and the actual source of the gold is less readily defined. The gravel contains fragments of granite, quartzite, schist, and marble.

On Napoleon creek conglomerate forms the bedrock near the mouth. The gravels contain fragments of quartzite, vein quartz, hornblende-granite, and various eruptive rocks, and the source of the gold is assumed to be the conglomerate, which is made up of fragments of the older rocks, for the rocks higher up the gulch above the conglomerates have not been found to carry much gold.

The most trustworthy reports from the Klondike region indicate that the exceptionally rich placer gravels thus far found occur in side valleys entering the main Klondike valley from the south, such as Bonanza, Eldorado and Hunker creeks, and in some gulches across the divide tributary to Indian or Stewart rivers. No gold in paying quantities has been found on the Klondike itself. The placer deposit generally consists of 10 to 15 feet of frozen muck and decayed vegetation at the surface, then a gravel bed that rarely pays; below that a clay selvage, under which is pay dirt from 1 to 5 feet in thickness resting on the upturned edges of the schist, from which it is separated by a clay selvage. The pay streak or bottom of the old channel is usually very regular and straight, not following the bends of the present stream. It is said to average 60 cents to the pan, and may yield $1 to $3. Only very exceptionally rich gravel can be worked at all under present conditions.

Probable Extent of Gold-Bearing Deposits.—In a new country gold is first sought in the stream gravels, and thence traced up to its source. Very fine gold may be carried long distances by river waters; hence it is only when it becomes relatively coarse, or at any rate carries coarse particles, that the source may be considered necessarily near at hand. Fine gold is found in almost all the rivers of Alaska; even the silts of the Yukon yield it in places. Gold has been found along the whole length of the Lewes, the Teslin, the Big Salmon, the Pelly, the Stewart, and the Selwyn, and on the Yukon river almost continuously from the junction of the Lewes and Pelly downward. Still further east, Frances and Dease rivers, the main branches of Liard river, which flows into the Mackenzie, carry gold. In the Cassiar district, on the Dease river, gold was discovered as early as 1861. The district was actively worked as a placer camp from 1873 to 1877, during which time it yielded about $5,000,000 worth of gold dust. These upper regions are distant about 1000 miles in a straight line from the known outcrops of gold-bearing rock in the Rampart mountains on the lower Yukon, are within areas either in which the exposures of the gold-bearing rocks as defined above are actually known to exist or in which the similar lithological character of rocks described renders it probable that in some part of the area they may be exposed.

There is also some evidence of the extension of rocks of the gold-bearing series to the northwest of the Lower Yukon, though it is as yet impossible to determine whether the primitive gold-bearing rocks of the Birch Creek and Forty-Mile series there come to the surface, or whether it is simply the fossil placers or gold-bearing conglomerates of later formations, where made up of fragments of these older rocks, that have furnished the gold of modern streams.

In this region gold has been found exclusively along the Koyukuk, and most abundantly, as already mentioned, where the valley cuts through conglomerates, supposed to belong to the Kenai series. This is at the forks, about 300 miles above the mouth, below which the country is low and swampy. Above the forks the mountains close in and the sides of the valleys become precipitous. The gold in the bars is said to be coarse, suggesting nearness to the source, and has yielded as much as $100 per day by use of the rocker. Prospectors are said to have explored to considerable distances above the forks, up to 500 miles from the mouth, and to have recognized rocks similar to those of the Birch Creek and Forty-Mile districts. This, if true, is important as an indication of still further extensions of the area of exposures of the older gold-bearing rocks.

Farther east, at the head of Dall river, low, broken hills, apparently composed of schists and quartzose rocks, extend northeastward to the Romanzof mountains. The latter are snow-covered in summer, and form the northern boundary of a low plain that lies to the north of Porcupine river. These mountains are likewise said to be made up of metamorphic schists and quartzites.

Still farther northwest, in the country to the northeast of Kotzebue sound, gold has been reported from the Kowak and Noatak rivers. It is possible that the older series of rocks is exposed in the mountains of this region, but more probable that the gold is derived from the conglomerates of the Mission Creek series, which, as already shown, afford gold on Napoleon creek and in the Mission Creek district.

Gold is also reported by prospectors from a belt of country which is generally parallel to the known gold belt but set off to the southwest, and which corresponds to the supposed southwestern flank of the granite backbone. Such discoveries have been reported from Fish creek, which flows into Norton sound north of St. Michael, and from the upper Kuskowim river, which flows into Bering sea. On the Sushitna river, which flows into Cook inlet. W. A. Dickey reports colors of fine gold in the sands all along the stream, and platinum on the upper river, where veins of white quartz carrying gold, silver and copper were found in slates associated with granite and porphyry. Gold and copper have been reported by various persons from the region about the sources of the Copper and White rivers. It is thus evident that the elevated region along the heads of these various streams, and between them and the waters of the Tanana, possesses great possibilities in the way of mineral development, but from all accounts it is a region exceptionally difficult of access, and it may well be questioned whether it is advisable to attempt its exploration until facilities for travel and obtaining supplies in the Yukon region have been increased, as they undoubtedly will be in the near future.

More accessible is the region immediately north of the Tanana river known as the Tanana hills and Ketchumstock hills, which from recent reports appears to be mainly a granite region, but in which it is likely that the outlines or patches of the gold-bearing schists will be found inclosed within the granite area.

Late reports by prospectors in the Tanana region state that the river has slack water, navigable for steamers 150 to 200 miles above its mouth; above that the current is swift. Mountains border the river on the north side from the mouth up; on the south they are far distant. Colors are found in all the creeks; those heading toward Forty-Mile and Seventy-Mile offer best promises, but no important prospects have been found. Toward Circle City the creeks do not freeze up, and a hot spring was found in one of the gulches.

In the mountain region to the northeast of the Yukon river, immediately above the bend, such observations as have been made do not offer much promise of exposures of the older gold-bearing schists. Older limestones occur there, but though important gold deposits are known to occur in limestones, in the Yukon country the general rule appears to prevail that gold is concentrated mainly in the siliceous rocks. It may well be, however, that in the conglomerate or cement deposits of the coal-bearing formations that are known to occur in this northeastern region there are portions sufficiently rich in gold to make payable placers by their wearing down. In searching for such places the prospector should study the character of the pebbles that make up the conglomerate. It is only when these include fragments of the gold-bearing rocks, and occasionally of vein quartz, that they are likely to be productive.

For the region east of the international boundary, Sparr had already pointed out, as a result of his observations in the summer of 1896, that the Klondike and Indian Creek regions were likely to show rich placers, because the schists of the Birch Creek series, and to some extent the marbles of the Forty-Mile series, formed the bedrock.

George M. Dawson reports bars of fairly coarse gold on the Pelly all the way up to Hoole river. Just below the mouth of the McMillan the river has cut a canyon through gray granite hills, below which are dark crystalline schists with east-west strike and northerly dip, associated with which are alternating marbles and chloritic schists, probably of the Forty-Mile series. Granite occurs again near the junction with the Lewes. Of the valley of the McMillan nothing was known. The Pelly above the detour or bend had a similar series of quartzite-schists, with interbedded limestones on the north, while the Glenlyon hills to the south were of granites. Above these are sandstones supposed to belong to the coal-bearing series and dipping 45° S. Still higher up in Hoole canyon are marbles again, associated with schists and volcanic rocks, possibly of the Rampart series. Still farther northeast, in the middle canyon of the Frances river, Dawson found marbles again, while in the Tootsha range to the east were seen granites and schists with abundant quartz veins.

All along the summit of the Coast Range the prevailing rocks are granites, cut by later prophyry dikes. They form a belt 20 to 80 miles wide, and are generally of the hornblende or intrusive type. On the Dyea and Skaguay trails they extend down on the northeast side to the mid-lenght of Lake Bennett. In the range of hills between Miles canyon and the Teslin river are diabasic or dark eruptive rocks and limestones, which may belong to the Rampart series, though Dawson considers the limestones to be probably Carboniferous.

Along the region of Rink and Five Finger rapids, below the Big Salmon, are infolded masses of Cretaceous rocks (Kenai?) with conglomerate at the base, overlain in places by lavas. Below these are greenish eruptive rocks, and near the mouth of the Pelly is granite again, succeeded below the Pelly by basalt flows. Twenty-five miles below the Pelly granitic rocks again appear, and are succeeded by crystalline schists of various kinds, which constitute the prevailing rock down nearly to Forty-Mile.

Drilling on the Mesabi Range.*

By E. J. LONGYEAR.

There are several kinds of drills in use. The diamond drill is largely used, and possesses the advantage of being in readiness to drill rock if thought advisable, the taconyte being very hard and almost impossible to drill, except by the use of diamonds. Some form of churn drill has been much used. This may be either a steam or a horse-power drill. The principle is the same in each, the cutting being done by percussion instead of by rotation, as in the case of the diamond drill. A churning motion is given by passing a rope from the top of the drill rods up through a sheave wheel, and down again, running two or three times around the drum of the engine, leaving the end loose. The drum continually rotates, and a man at the loose end alternately tightens and slackens the rope, thus raising and dropping the drill-bit at will. The bit itself usually has a single cutting edge, rather thin toward the lower end, and a thread cut on the upper end, in order to attach it to the drilling rods, which may be the flush-joint rods used with the diamond drill or extra strong gas pipe connected by extra long couplings, to protect the threads from the strains occasioned by the pounding of the bit. In surface drilling a 3-inch casing of common gas pipe and a 1¼-inch drill rod are used. In ore a 2-inch casing is put in after the 3-inch has been stopped, and a 1-inch drill rod is used. A 4½-inch casing pipe has been tried several times for deep surface work, and after it could be driven no farther a 3-inch pipe was inserted; but it was found that the sand is quite liable to rise between the two pipes and hold them together, preventing the smaller pipe from being driven. As a rule, it is safer to start from the top with a 3-inch pipe, and make every effort to carry it through the surface.

Surface drilling requires more experience on the part of the drill man than ore drilling, which is simpler in operation, although requiring great care in order to secure reliable results. In surface drilling many difficulties arise calling for much ingenuity. A bit may be lost off and be wedged across the hole in such a position that it cannot be recovered, when

* Lake Superior meeting American Institute Mining Engineers.

perhaps a stick of dynamite will force it to one side, out of the way. Sand may arise between the drill rods and casing pipe at a time when the pump refuses to work, holding the two together so tightly that jackscrews will not loosen them. A number of methods will probably have to be tried before the rods can be recovered. A boulder of any size is best overcome by shattering it with 60 per cent dynamite, care being taken to raise the casing pipe at least 5 feet after lowering the dynamite to the top of the boulder. An electric battery is used to do the blasting. Two or three blasts will allow the casing to pass through almost any boulder, unless it is an unusually large one. Careful blasting and attention to keeping the pipe loose by turning it while driving are important points to be observed.

The cuttings are washed out by means of water forced down by a pump through the hollow rods, and up again between the rods and casing. The operations of drilling, washing out, and driving the casing are carried on sometimes singly, sometimes two at once, and sometimes all three together, according to the nature of the ground. A No. 4 pump is a good size to wash with. It can be easily lowered into a small test pit, and it will handle enough water in most cases. A cast iron cylinder 10 inches in diameter and 12 inches long, with a 2-inch hole through the middle, weighing 240 pounds, makes a good drive block. The hole is for the rod to pass through and acts as a guide for the block, which is raised by attaching the drill rope to it, and operating it the same as in raising and dropping the drill rods.

After striking ore, if the material just above it is sandy, it is better to drive the 3-inch pipe 5 feet into the ore and stop, continuing in ore with a 2-inch pipe, as fine sand is apt to run down behind the casing and injure the ore sample if the same pipe is used in sand and ore. The Mesabi ores are too soft to make a core with a diamond drill, and are generally sampled by the churn drill, the cutting made by the bit being washed out through a tee in the top of the casing. Even when a diamond drill is used, it is better to run it as a churn drill, although the more rapid progress made with a diamond bit offers a temptation to use it. But the revolving rods, grinding on the casing pipe, wear off a large amount of metallic iron, which mixes with the ore sample, producing at times surprising results in the assays. The cuttings made by the chopping bit are often washed out at the same time that the drill is working; but more accurate results can be obtained by drilling "dry"—that is, by chopping without pumping any water through the rods, the cuttings mixing with the water that stands in the hole. When the depth desired to be sampled has been drilled, the casing pipe driven down, and the material that has been packed by driving loosened by redrilling, the chopping is stopped, and water is turned on, flushing the sample to the top into barrels. The pump should be worked to its fullest capacity in order to bring up the complete sample with a minimum amount of water. One barrel of water will usually be sufficient to wash out a 5-foot sample, unless the hole is more than 200 feet deep. After settling until the water is clear, it is drained off, and the sample is taken out, dried, quartered down, if desired, sacked and properly marked. When the ore is drilled "wet," the water carrying the sample is run through a series of three or four settling barrels, the overflow from one passing into another. When a sample has been drilled, the clear water is drained off, and the sediment in the different barrels is collected together and dried.

The dry method of drilling is preferable to the wet for two reasons. First, it drills a hole of uniform size—a very desirable feature in accurate sampling—whereas in the "wet" method a stream of water is continually playing around the bit, and will wash out more of the soft layers than the hard. The Mesabi ores usually occur in alternate layers of hard and soft ore. Second, the water overflowing the barrels is liable to carry away more or less of the lighter parts of the sample, making it too rich in iron.

The writer made some tests to determine the effect of incomplete settling on the sample, and also the effect of heat in drying. A sample was made up by mixing a lot of blue ore, brown ore, yellow ore and paint. After crushing to about the fineness of a drill sample, it was carefully mixed and divided into five portions. These were treated as follows:

Portion A was analyzed for iron and phosphorus; B was mixed in a pail of water, allowed to settle sixteen hours, water poured off, and sediment dried at less than 212° F.; C was mixed in a pail of water, allowed to settle sixteen hours, water poured off, and sediment dried at a high temperature; D was mixed in a pail of water, settled sixteen hours, sediment dried with considerable heat until nearly dry, and then finished slowly; E was mixed in a pail of water, settled twenty minutes, water drained off, and sediment dried at less than 212° F.

The analyses of these dried ores resulted as follows:

	A	B	C	D	E
Iron, per cent.....	59.23	59.69	59.95	59.67	60.804
Phosphorus, per cent..	0.087	0.086	0.087	0.880	0.09

The conclusions to be drawn from this test are that too much pains cannot be taken in allowing a thorough settling of the ore sample before removing from the barrels, and that a rapid drying will not injure the sample materially. I have, however, made a practice of using considerable care in drying.

The taconyte underneath the ore is hard to drill, but with the aid of dynamite enough can be secured to determine its character.

The drilling on the range is mostly done by contract, $2 to $2.50 per foot being paid for ore, $2.50 to $3 per foot for surface, and $4 to $5 per foot for taconyte. Three men to each crew work to the best advantage. Wages are from $1.35 to $2.25 per day. A good outfit costs about $800.

An accurate map of the work should be made, drawn to a scale of 200 feet to the inch, and the ore area marked on it by a line inclosing all the ore pits. It is the practice to allow 100 feet outside the ore pits in locating the boundary line. The ore area, being measured on the map by means of a planimeter, is reduced to square feet, and multiplied by the average thickness of ore as determined by the different pits, giving the contents in cubic feet probably as nearly accurate as the prismoidal formula would give it. To reduce this to tons, 13 cubic feet is usually taken as equal to one ton.

Points for Prospectors.

Philip Minor of Seattle, Wash., has written a little book which embodies a good many practical pointers for miners and prospectors. It is intended mostly for the amateur, though some of the contents of the pamphlet could be read with profit by experienced men. This is his idea as to "Where to Prospect":

In exploring a new country not previously prospected, the all-important question to be determined first is: Is the object you are seeking in the region you are in? The first route of exploration, and often the main line of travel, is along the river; either on the water or along the bank. If game is your object, look for tracks at the places of easiest access. If you are seeking gold, the easiest place to find the trace is among the boulders at the water's edge at low water, and at the head of the rapids.

Find a place on the low bars, where the current is strong enough to carry away all the light gravel when the water is up, but not strong enough to tear out the boulders as large as your head. If you find a few points of rough bedrock sticking up, it is the best in sight. Now, with a pick or bar, turn out a few boulders and take the sand and gravel from among them and pan it carefully. If you get a large handful of black sand, and not a color of gold, try two more such bars, and, if they yield the same, go down stream, for there is but a very slim chance of any pay on any branch above.

If you get some gold, but not rich enough to satisfy you, then hunt for some place where you can dig to bedrock, and find a layer of coarse gravel on what is or has been at some time the head of a rapid. Dig there and test the gravel, and also clean out the crevices in the bedrock and wash the dirt. If the pay dirt is not there, it is probably up the stream; perhaps up some creek or gulch, each of which you should try as you pass.

When you have found a creek that prospects better, or yields coarser gold than the river does above the mouth of it, follow it up. Take notice as to what kind of rock the gravel is made up of and the nature of the bedrock, and when you pass a rapid or find the channel widening out, so as to form a bar on either side of the stream, try for bedrock, the same as on a river, at both ends of the bar, and don't forget the small gulches.

The best claims on a river or large creek are most likely to be where the channel is of moderate width, and the bedrock has a natural grade of 7 to 18 inches to the rod. Deep holes in a channel very rarely pay for cleaning out, theorists and professors to the contrary notwithstanding.

The best claims on a small gulch are at, and just below, the ledges and veins that furnished the gold, due allowance being made for water.

Diggings are often found on the sides and tops of hills, and, if the water can be obtained for working, they sometimes pay wonderfully. They are of two sorts. That is, old channels and vein outcrops.

The old channels are where the streams have run in an earlier age of the earth, and, while usually following the same general course as the streams of the present age, they often cross nearly at right angles, and in rare cases even run the other way. They may be good, poor or indifferent, but usually have the advantage over the modern channels of having plenty of dump. Their most common form, that of high bars near present streams, are often the best paying mines in their districts.

In some parts of the world they are covered with lava or other volcanic flow, in such a way as to puzzle the oldest inhabitant; and it takes a fine flow of speech, indeed, to describe them so that sensible people will think the speaker understands them.

Vein outcrops are usually richer and more profitable than the veins that they lead up to, but not always. Very much depends upon the character of the rock, and the gold is often hard to save, being in all shapes and sizes, and often coated with other mineral, or enclosed in rock, which makes crushing necessary.

Nearly every miner is more or less tied to his own theory as to where gold is likely to be found, which is the result of his own observation and study, and, when he finds out, and is compelled to acknowledge to himself that his own pet theory is wrong, he usually contents himself with the proverb of the ancients that "Gold is where you find it," yet it remains a fact that you are more likely to find it among some kinds of rock than among others, and it may be set down as a rule that, when all the rocks you can find in a certain region lie in horizontal layers, whether they are of slate, limestone, sandstone or lava, and the boulders in the streams consists of the same material, it is not worth while to look for gold in that region.

If the hills are rounded at the top like haycocks, and boulders of porphyry and pieces of quartz are common in the streams, the stratified rocks dip under the hill, and dykes of porphyry and other eruptive rocks are common, then gold is likely to be found not far away.

And the largest and best mines are usually found near where the longest and strongest dykes or eruptive rocks cross that part of the country rock which carries the gold. And sometimes it is the eruptive itself which furnishes all the gold, though its stepmother, the quartz, gets all the honor.

Among old-time miners it is said that "quartz is the mother of gold," and, as a matter of fact, when both are found in the same kind of country rock, on one hill, they are nearly always both in the same fissure, or vein; though either one may be found with scarcely a trace of the other. Veins containing gold, however, nearly always contain either quartz, iron or talc also, and often all of them, and many other metals, making a rock that almost anyone would recognize as ore, and, with a little practice, could readily trace it home, if not too much scattered.

Among placer miners black sand is said to be an indication of gold. As a matter of fact, when both gold and black sand are in the bed of the same stream, where the currents throw one they will throw the other also, as both are much heavier than common sand. So, in prospecting a stream, if you get one in large quantities and none of the other, you can take it for granted the other is not there.

From Arizona.

TO THE EDITOR:—A recent trip to several sections of Arizona has impressed me with the general spirit of enterprise and activity prevalent there. The copper mines at Jerome, Bisbee, Globe and Morenci have never produced so largely as now, and all are preparing to increase their output. In various sections copper properties with promising indications are being developed, and others are beginning to attract the attention of capital. The railroad now terminating at Geronimo, Graham county, is being rapidly extended towards Globe, and this substantial copper camp is shortly to have the transportation facilities she has so long needed. I saw Apaches at work upon the railroad and at other avocations suggestive of peace and comfort, and at San Carlos Agency found the Indians actually contemplating with complacency the coming of the railroad. A strip of the Reserve, upon the south, has lately been surveyed, and is soon to be segregated from the Reservation. This strip includes the Deer Creek coal fields and a large section showing promising indications of copper. The strip is well peopled with men holding possession of coal and mineral locations, and who are awaiting the opening of the strip to perfect their titles. Very little work has been done in the way of development upon any of the claims, but I saw a number of locations showing good carbonate, oxide and sulphide ores and native copper, and some of the ores are said to contain more than a paying amount of gold and silver. There is much iron present, and the country is a good formation of quartzite, lime, shale, sandstone, etc., cut with porphyry dikes. This strip may yet be heard from as a copper producer, and if the Deer Creek coal fields produce coal in quantity, and of a fair coking quality, the section might have many advantages as a mining region.

Several projected branch line railroads are about to be constructed, and it seems to be generally considered that the next few years the completion of the very large water-storage and irrigation enterprises for the development of the rich and extensive agricultural lands of the Territory.

Arizona has much reason to be content with her present share of prosperity and real reason to be certain of the early future development of her latent possibilities. JNO. W. GRAY.

Oakland, Cal., April 2nd, '98.

THE great demand for copper is rendered still greater by the present hostile complications. The United States and Spain are the greatest copper producers, and war possibilities make copper properties to-day more valuable than ever. There is probably no business of more present profit than copper mining. Every department of mining, the basic industry of peace or war, receives increased stimulus from the present warlike outlook.

Paraffine Paint.

TO THE EDITOR:—In the issue of your paper under date of March 26th, you have an article headed "Some of the Questions Asked." One of the subdivisions of this article is a reply to a question from a Rossland, B. C., correspondent who wants to know "how to keep timber for underground use from decay." In reply to this you give as your opinion that the creosote process is probably the best treatment to which this timber could be subjected.

We are writing you for the purpose of calling your attention to P. & B. paint, which has been manufactured by us and been on the market since 1884. This paint is used to a very considerable extent for the purpose of painting timbers which are submerged in water or in the earth, and is an excellent material to use for the prevention of decay and rot and for the preservation of the timber.

Our paint differs from the ordinary asphaltum paints and the many products of coal tar, and must not be confounded with these articles, which give merely a surface coating. P. & B. paint, on the contrary, effects a complete bond with the wood or iron to which it is applied, has great tenacity and is a wonderful resistant to acid and earth gases. For this reason it is largely used for timber preservation.

PARAFFINE PAINT CO.

San Francisco, Cal., April 2nd, '98.

Vitality of Dogs.

During the summer of 1895, at the Jessie mines in Gold Run, near Breckenridge, Colo., a Scotch terrier bitch, "Dixie" by name, and the property of Mr. W. L. Wilson, Mgr., fell into a dry winze in one of the old workings, where she was found alive after being in the hole for thirty-two days. She had neither food nor water during this time. She was very fat when lost but very thin and weak when found. She recovered entirely.

At Sulphur Creek, Cal., an old hound belonging to Mr. H. A. Blanck fell into a dry disused shaft, 65 feet deep, on the 14th day of March, 1897, and was found and taken out alive on April 13th following, having been in the shaft thirty days without food or water. He also was very fat when lost and very weak and poor when found. He recovered entirely. I suppose this was enforced hibernation similar to that practiced by bears and like animals.

PH. REARDEN.

Sulphur Creek, Cal.

ACCORDING to current report, a Paris physician has discovered what will be of undoubted value to electrical men who are so unfortunate as to be burned by the electric current. A solution of one part picric acid and 75 parts of water will cure quickly the most serious burns occasioned by the electric current. The pain is removed without blistering or irritation. A yellow tint is left on the skin, which may be removed by a solution of boric acid.

AT DeLamar, Nevada, steam motors are being substituted for mules and horses for freight purposes. At Verdi such motors capable of hauling fifty tons have long proved valuable on steep grades. In Humboldt and Churchill counties borax and soda are similarly handled, the level country there admitting a speed of eight miles per hour. Gasoline is used for fuel with gratifying success.

DURING 1897 the gold received at the Sydney, New South Wales, mint for coinage amounted to 756,964 ounces; in 1896, 712,809 ounces.

THE annual meeting of the Northwest Mining Association for 1898 will be held in Spokane, Wash., December 14, 15 and 16.

THE Kennedy mine, Amador Co., Cal., is 700 feet below the level of the sea—2400 feet deep.

IN San Francisco the present value of a Mexican dollar for customs purposes is 44.4 cents.

Coast Industrial Notes.

—The *Times* reports the present market value of oil 85 cents a barrel f. o. b. Los Angeles.

—F. G. Barnes' mill, in Silver Lake, Cowlitz county, Wash., recently cut 79,000 shingles in one day.

—New gushers at Coalinga, Fresno Co., Cal., now give that district a daily petroleum product of 900 barrels.

—Eight thousand claims have been recorded with the agent of the Dominion government at Dawson City since September last.

—R. E. Russell, Mgr. Stockton and Tuolumne railroad, says the new railroad will be built to Sonora, Cal., before the end of '98.

—Track laying is finished on the Astoria and Columbia River railroad from Astoria, Or., to Goble, forty miles from Portland and sixty miles from Astoria.

—In Los Angeles hay and grain are scarce, and prices are high. Hay is quoted at $20 for wheat, $18 for oat, and $15 for barley. In San Francisco hay is held at $23 per ton.

—The Oriental Steamship Co. have ordered three vessels for the new line between Hongkong, Japan and San Francisco. One, to be called the America Maru, has a gross tonnage of 6000.

—The budget expenses of the Mexican Government, as estimated by Secretary Limantour, amount to $52,089,484 45 for the fiscal year 1898-99—an increase of $1,708,598.92 over the previous year.

—The provision in the sundry civil bill appropriating $400,000 for the construction of a deep water harbor at San Pedro, Cal., in accordance with the plans of the Board appointed by the President, was agreed to by the Senate on the 6th inst.

—President Corbin of the Spokane and Northern railroad has been granted a charter by the Dominion parliament for his proposed extension into the Boundary Creek country of southern British Columbia. The road will be built this summer.

—The gap in the Rocky Mountain Bell Telephone Company's line between Herron, Mont., and Mullen, Idaho, 125 miles, is to be closed, making a continuous line from Livingstone, Mont., to San Francisco, the longest telephone connection in the world.

—The steamship Alameda, from Sydney via Auckland and Honolulu, yesterday brought $2,000,000 in English sovereigns. This is a total since last fall of $18,500,000, and is in payment for the balance of trade in favor of the Pacific coast for wheat, flour, lumber, canned goods, etc. Since Feb. 25, N. Y. City has imported $25,000,000 gold from Europe.

—Americans who have taken a contract with Ecuador for building the railroad from Guayaquil to Quito are to get $17,432,000. At the starting point, Quito, the track will be 9350 feet above the sea. Chimborazo will be crossed at an altitude of 12,300 feet, and there are other points where 11,800 and 11,980 feet are reached. The road will be 404 miles in length, at an average cost per mile of $43,396 in gold.

—The Union Electric Power and Light Company, capital stock $1,000,000, has incorporated at Copperopolis, Cal., to divert power from the Stanislaus river and to furnish power and light for mines and towns; stockholders and trustees—O. Ames, S. Carr, Boston; G. McM. Ross, B. Johnson, Copperopolis; F. D. Nical, Stockton. The incorporation is understood to mean the resumption of the Copperopolis copper mines.

—Congressman DeVries of California this week introduced a bill to enable the United States Government to expend for the improvement of the Sacramento and San Joaquin rivers the moneys appropriated by the State for this purpose, with a view to its incorporation in the next river and harbor bill and to enable the Government to use the $300,000 appropriated by the State for the improvement of the lower Sacramento river.

—The Government report on coal production in the United States in 1897 shows that the value of the coal mined in twenty out of twenty-nine States was less by $2,000,000 than the coal mined in 1896. Oregon is one of the States showing a decrease. California produced 89,092 tons, valued at $200,866, or $2.25 a ton; Washington 1,434,112 tons, with a valuation of $2,777,637, or $1.94 a ton, and Oregon 100,311 tons, worth $311,500, or $3.11 a ton, the highest price in the country.

—Of Los Angeles oil territory, Prof. Strasburg tells the *Herald* that unless further local oil territory is developed soon the few remaining lots will all be drilled upon in the next thirty days, and present prices must advance. The amount of fuel oil above ground in the city of Los Angeles is in the neighborhood of 300,000 barrels, of which 225,000 barrels is in the market, with the present monthly consumption of fully 85,000 barrels. The production for the month of April should be about 90,000 barrels.

Recently Declared Mining Dividends.

Whitewater, British Columbia, $40,000; April 1.

Moon-Anchor, Colorado, 2½ cents per share, $15,000; April 1.

Boston & Montana, Montana, $3 per share, $450,000; payable May 20.

Swansea, Utah, 5 cents per share, $5000; payable April 11.

London & B. C. Goldfields, Limited, B. C., 25 cents per share; April 1.

Pennsylvania, California, 5 cents per share, $2575; payable immediately.

Personal.

D. B. PEASLEY is Supt. Washoe mine, West Point, Cal.

C. L. LANG is appointed Supt. Star mine, Sonora, Cal.

PRES. SWETLAND of *Power*, N. Y. City is visiting California.

J. W. GRAY of Oakland, Cal., has returned from New Mexico.

A. SUEDAKER becomes Supt. Silver Ledge mine, Ouray, Colo.

F. G. BULKLEY is the new Gen. Mgr. Ibex M. Co., Leadville, Colo.

W. H. STORMS, Supt. Agnes mine, Sonora, Cal., is in San Francisco.

F. O. WOODS becomes Gen. Mgr. Christmas mine, Cripple Creek, Colo.

P. C. DONOVAN is Supt. of the new company beginning work at Eureka, Nevada.

M. W. MATHER, Supt. Crœsus G. M. Co., Alleghany, Cal., is in San Francisco.

F. L. HINES is succeeded as Supt. Northern Light mine, Mercur, Utah, by R. G. Legg.

MGR. NORTON of the Tutthill Wheel Co. has returned to San Francisco from Los Angeles, Cal.

W. A. DENIS, Supt. Mountaineer mine, Nevada City, Cal., has returned home from San Jose.

W. T. ROBINSON, Supt. Spanish Bar G. M. Co., Mokelumne Hill, Cal., is in San Francisco.

J. A. FERGUSON, Supt. Red Point mine, Damascus, Cal., has returned home from San Francisco.

A. M. MCDONALD, Supt. Kanaka mine, Groveland, Cal., has returned home from San Francisco.

JOS. MCGILLVRAY has returned from British Columbia and contemplates an extended visit to England.

CHAS. BUTTERS sailed hence from South Africa on the 8th ult., and is expected here this month.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., has returned to the mine from San Francisco.

G. KARTSCHOKE, Pres. Champion M. Co., has returned to San Francisco from a trip to the mine, Nevada City, Cal.

T. J. PARSONS, Vice-Pres. California Miners' Association, has returned to San Francisco from Nevada City, Cal.

J. M. BUFFINGTON of Nevada City, Cal., will begin development of a quartz property this month near Forbestown, Cal.

MR. A. S. HALLIDIE contemplates departure for the Atlantic coast about the 10th prox., in the interest of the Wilmerding school.

A. H. LUBECK, for eleven years assayer of the Ontario Co., Park City, Utah, goes to the Carahaucra M. & M. Co., Yaulie, Peru.

J. R. COOPER has resigned as Mgr. of the D. & L. S. smelters, Houghton, Mich. He retires May 1st. His successor will be J. Case.

PROF. ANDREW LAWSON, the University of California geologist, has returned from the international meeting of scientists at St. Petersburg.

MAJOR HEUER, with Engineers Randall and Morse, last week visited Elkhorn, on the Sacramento river, where the proposed jetties are to be constructed.

D. J. MCDONALD has resigned as provincial inspector of mines to enter the service of the British Am. Corporation. He will be located at Rossland, B. C.

MRS. ELMIRA CLARK of the Carlisle mine, Butte county, Cal., proposes to put in a cyanide plant and has started on a trip of personal examination of similar operations elsewhere.

B. WINCHELL, Gen. Pass. Agt. Union Pacific, Denver & Gulf road, has been appointed Gen. Pass. Agt. St. Louis & San Francisco line, to succeed G. T. Nicholson, who will go to the Atchison, Topeka & Santa Fe as Pass. Traffic Mgr.

W. E. HAMPTON, Prop. and Gen. Mgr. Pacific Tank Co., is in the city for a few days on business connected with the San Francisco factory. Mr. Hampton for the past three months has been in Los Angeles looking after his new factory at San Pedro, Cal.

GEO. E. AMES, for many years agent of the Union Iron Works, and one of the oldest and best known mining engineers in the United States, has accepted the position of consulting engineer of the Anaconda, Montana, Copper Co., and left this week for his new home.

PROF. F. A. C. PERRINE is reported about to resign from Stanford University, Cal., to take the position of consulting engineer for the Blue Lakes Water and Electric Power Co., a full account of whose proposed operations appeared in the issue of March 19th.

MELVILLE ATTWOOD, the veteran mining engineer and assayer, is reported in his last illness at his residence in Oakland, Cal. Mr. Attwood made the first assay of Comstock ores in '59, and for over sixty years has been identified with mining and metallurgical interests in Europe and America.

E. G. LUKENS, Sec. Judson Powder Co. and Pres. Western Fuse Co., has returned from Denver, Colo., where he had been in conference with R. H. Ensign of Ensign, Bickford & Co., who own a fuse factory in Simsbury, Conn., and F. J. Fretter, Pres. California Cap Co., considering the project of erecting a fuse factory in Denver.

Commercial Paragraphs.

THE Pacific Tank Co. is now manufacturing three large cyanide plants, one of which goes to Mexico, and is the largest cyanide plant ever shipped from the United States, requiring the full capacity of sailing vessel to carry the material. This speaks well for home manufacturers.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 29, 1898.

601,334.—CASH REGISTER—Bradt & Kindleberger, San Diego, Cal.
601,519.—SPRING HEEL FOR BOOTS—J. Bresman, S. F.
601,550.—TOWEL RACK—H. S. Broughton, Stayton, Or.
601,406.—CARGO TRIMMER—J. C. Corwin, Tacoma, Wash.
601,431.—FLOATING DOCK—J. J. Cousins, S. F.
601,316.—LOCK—J. W. Dickson, Castle Rock, Wash.
601,242.—CAR FENDER—G. W. Douglas, S. F.
601,338.—METALLIC ALLOY—G. R. Evans, S. F.
601,561.—CULTIVATOR—V. A. Gleason, So. Riverside, Cal.
601,568.—PACKING BOX—P. I. Jacoby, S. F.
601,257.—GATE OPENER AND CLOSER—C. S. Jenkins, Los Angeles, Cal.
601,514.—CAN SOLDERING MACHINE—A. Johnson, S. F.
601,444.—STOVEPIPE COUPLING—A. E. Lotstrom, Spokane, Wash.
601,253.—EMBROIDERY HOLDER—J. C. Orchard, Tacoma, Wash.
601,524.—DREDGER—J. R. Parker, S. F.
601,380.—CORK EXTRACTER—C. F. Phillips, Los Angeles, Cal.
601,383.—BIBLE WHEEL—W. C. Reuter, Walla Walla, Wash.
601,589.—SAUCEPAN—A. Rochat, Golden Gate, Cal.
601,529.—SHOE PROTECTOR—J. O. Sharpless, Fairhaven, Wash.
601,288.—ROCK DRILL—J. P. Simmons, S. F.
601,605.—INDEX PORTFOLIO—H. J. Weeks, Santa Barbara, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLOATING DOCK.—James J. Cousins, San Francisco, Cal. No. 601,431. Dated March 29, 1898. This invention relates to improvements in the construction of floating docks, such as are employed for docking vessels. It consists essentially in the novel construction and arrangement of compartments by which the dock is perfectly balanced and by which lifting pressure is directed to points in the vessel where the greatest weight lies, so that strains upon both dock and vessel are avoided. In conjunction with this is an arrangement and connection of the compartments and the pumps by which they are emptied, so that a portion of the compartments may be emptied by pump and another portion by the flow of the water therefrom by gravitation to reduce the cost and time, and by this means only as many compartments need be exhausted as are necessary to raise the particular size of vessel which may be upon the dock. This enables a dock which is capable of handling the largest vessel to be economically employed for the handling of small vessels.

DREDGING APPARATUS.—John R. Parker, Oakland, Cal., assignor to the Pacific Coast Dredging & Reclamation Co. of San Francisco, Cal. No. 601,524. Dated March 29, 1898. This invention relates to dredging apparatus, and it consists essentially of improvements in that portion of the apparatus by which the material is transferred from the plows or diggers which excavate it to a distant point where the dredged material is to be deposited. It also consists in a novel means for advancing the digging apparatus as fast as it is required for the purpose of excavating fresh ground. The object of the invention is to provide a means for connecting the rigidly supported conveying pipe with the corresponding rigid connection between said pipe and the digging or excavating mechanism in such a manner that the latter may be advanced as the necessities of the work require without the employment of any flexible sections in the conveying pipe. It consists also in the formation of a swivel joint between the two rigid pipe sections which will allow that portion connecting with the digging apparatus to be swung in an arc of a circle with relation to the joint, so as to excavate to any desired width.

Recent California Mining Incorporations.

Temescal G. M. Co., San Francisco; capital stock, $1,000,000; subscribed, $250; C. B. Filley, J. E. Stock, J. F. Holling, H. W. Gray, F. McPherson.

Little Dick M. Co., Santa Barbara, Cal.; capital stock, $6000—all subscribed; A. B. Williams, J. H. Burson, A. C. Grant, W. Ealand, C. Leveday.

San Domingo G. M. Co., San Francisco; capital stock $1,000,000, subscribed $500; C. H. B. Laughlin, B. G. Somers, C. W. Cross, M. Trueman, A. H. Washburn.

Alaska Hydraulic S. Co., San Francisco; capital stock $5,000,000, subscribed $4,110,000; W. H. Acamo, F. J. Symmes, F. H. Wheelan, J. W. Stetson, W. E. Holbrook.

Mazeppa G. M. Co., San Francisco; capital stock $600,000, subscribed $400,000; D. R. Oliver, W. H. Straub, T. S. Hender, G. L. North.

San Luis Rey M. Co., Los Angeles; capital stock $1,000,000, all subscribed; D. S. Redican, C. B. Atkins, R. F. Del Valle, F. L. Binford.

The Electro-Zinc Slimes Process.

From the *South African Mining Journal* of November 20th, '97, was taken an account of an experimental plant, and of the methods pursued by Mr. Bettel for saving the solid portion of the slimes effluent leaving the sands plant, for its admixture and agitation with cyanide solution, for the decantation and filtration of the gold liquor, and for the final precipitation of its gold contents. The plant was erected at the Comet-Angelo reduction works. It was then explained that the clear gold liquor is decanted off through a floating syphon of special construction, and is delivered into an equalizing tank of three compartments, which by means of a differential ball-cock arrangement allows of the discharge into the extractor boxes under an even head. The extractor boxes in use are of special design, 30 feet by 6 and 3½ feet deep, divided into seven longitudinal compartments for anodes and six longitudinal compartments for cathodes—these, again, being subdivided into twelve compartments, giving eighty-four anode and seventy-two cathode compartments. The anodes consist of sheets of lead coated with a non-conducting insoluble varnish having mixed with it a conducting material (perplumbic-graphitate) practically unoxidizable. The cathode compartments contain perforated zinc cages fitted with zinc shavings. Both cathode and anode boxes have terminals, which are fastened to the respective positive and negative poles of the electro-plating dynamo in use, which has a capacity of 400 amperes under twenty-five volts pressure. The separation of the cathode and anode compartments is effected by means of a specially prepared canvas, which, while not interfering with electrolysis, prevents the undue mixing of the anode alkaline solution with the cathode auriferous KCy solution.

The trial run having been concluded and as full a cleanup as possible having taken place, the general results obtained have become known. The *South African Mining Journal* claims that the scheme of the process has been entirely misunderstood by the majority of technical men whose criticism is of value, believing the general impression to be that the total extraction is the test by which this new process must stand or fall. The inventor states with emphasis that nothing would induce him to erect or work another plant on lines similar to that he is now using. Circumstances rendered it necessary that a trial plant should be erected in great haste, consequently neither site, design nor workmanship could be subjected to that searching discrimination which only a full purse and ample time could ensure. The site had to be arbitrarily fixed; the time for erection was compressed into four and a half months, too short for the purpose in view; and the design was governed entirely by the choice of material which could be got within that short period and with the funds at his disposal. Moreover, the product which it has fallen to Mr. Bettel's lot to handle as slimes—throughout the whole of his trial run—had, through circumstances unpreventible on his part, so large an admixture of sands as to have been recognized by both J. R. Williams and Chas. Butters as no fair test for a slimes method. When, therefore, the objection is raised that the electro-zinc process has at its trial run secured only a theoretical extraction of 59.59 of the assay value of the product treated, a fraction of the truth is told.

In regard to the material delivered at the plant, the *Journal* says the erection of the spitzkasten at the tail end of the sands-plant ensures a very satisfactory product. Previous to the erection of the spitzkasten, the product contained 30 per cent of leachable sands, which delayed the working, wore out the centrifugal pumps, were only slightly affected by the weak solutions in use, and, owing to the limited number of tanks, the treatments had to be confined to two, in place of the three usually employed in other slime plants. Under the conditions prevailing at the plant, mechanical agitation could not be used, and the agitation by pumps was carried on under unfavorable conditions.

The solution of the gold is a side issue, because the results obtained by both Mr. Williams and Mr. Butters prove how excellent are the results which are to be obtained by at least two of the several possible methods if the plant is properly equipped.

The sole feature of the present plant was the production of gold solution to be utilized in testing Mr. Bettel's new process—the electro-zinc method of precipitation. Therefore, it is only fair that the process should be accepted or condemned solely by the standard of its precipitation. The East Rand management are responsible for both the samples taken and their assay. On this basis, the average of the solution value after precipitation works out at .108 dwt. per ton of solution, under circumstances admittedly unfavorable. Compared with the normal results of the other method—which averages some nine grs. per ton of solution, and frequently rises as high as eighteen grs.—this result of two and a half grs. is undoubtedly satisfactory. Furthermore, in the older process only part of the bullion won is collected at the cathode, the balance having to be recovered from the Prussian blue, and from the anode, at an appreciable loss to the companies. In the new process, the only by-product (apart from the usual cyanide slags) was some sixty-one pounds of very fine clay sediment which had passed the filter; the fine gold contents of this amounted to thirteen ozs., equal to 10s 6d in money value—probably a loss not worth any effort to recover. At the request of the directors—who wished for a close clean-up—the whole of the zinc shavings, amounting to 3000 pounds, was dissolved by sulphuric acid. The slimes produced were smelted in clay liners just fitting into a No. 60 plumbago crucible—the flux being of an oxidizing nature; the lead and the bulk of the copper, together with some silver, were thereby retained in the slags as oxides and borates, and a bullion of 885 parts of fine gold per 1000 was obtained. Taking the weight of the bar, some 257 ozs., and adding thereto six ozs. of gold in stock solutions with the amount of fine gold in the clayey slimes, 51.2 per cent of gold out of 59.59 theoretical, has been accounted for. To this has to be added the gold still to be secured from slags and pots, which will probably amount to further 6 or 7 per cent, and in the ordinary way will go into the next cleanup.

One of the objections raised against the new method is the use of perforated zinc cages for holding the zinc shavings; it was contended that so much gold would adhere to the cages and that a substantial amount of gold would be locked up in the boxes. This was not proved to be the case. ; the cages were washed in a very dilute solution of sulphuric acid, and no difficulty was experienced in removing practically the whole of the adhering gold with no damage to the cases.

In the opinion of the *Journal* the feature which will most recommend the new process to mine managers is the ease with which the zinc shavings utilized in it can be taken from the electro-zinc boxes and be used in the place of fresh zinc in the precipitation-boxes of the normal zinc process. The precipitated gold, although in a spongey state, adheres so firmly to the shavings that the latter can be rinsed in a weak solution or water for the purpose of ridding it of the clay slimes, without the removal of more than a trace of gold ; nor does it adhere so firmly as to resist removal by mechanical means. The zinc thus slightly coated with spongey gold is in a better condition to effect precipitation with stronger solutions of the sands process than are clean zinc shavings.

Under normal conditions the electric installation works smoothly and requires little attention.

Another feature is that it is possible to let the zinc shavings stand in the boxes without electricity passing through them for as long as eight days and the precipitation (when the current is passed through) proves to be perfect.

Working Out the Details.

Once in awhile the *Tribune* receives a letter describing briefly some proposed invention, and winding up with some such phrase as this: "I only throw out the crude idea now; but I think it would be easy to work out the details." Sometimes the writer intends to conduct the latter part of the proceedings himself; sometimes he wants a manufacturer to undertake the task. But in either case, he considers the "working out of the details" a trifling matter, and usually believes that the main part of the work has already been done in conceiving "the crude idea."

This is a very common, but really a serious, error. A great many things which look all right, while still existing only in the mind of the inventor, develop some unforeseen defect as soon as they are put to a practical test. Long before Edison's day, for instance, other men had the "crude idea" that light could be produced by heating to incandescence a filament of some substance by sending a current of electricity through it. In fact, they knew it. But none of them produced a successful lamp. And it took Edison five or ten years, and cost him many thousands of dollars, to "work out the details." He found that platinum was unavailable for a filament, and that carbon was better. He sent men all over the world, to the jungles of India and to the forests of the Amazon, to get different kinds of vegetable fiber with which to experiment, so that he might find the best. Then he discovered that a better vacuum was needed, instead of the bulbs, than could be secured with ordinary air pumps, and so he went to work to invent an improved air pump of his own. Besides these other important details, there was this essential problem requiring attention: How could he persuade just the right amount of electricity to leave the main wire and go into each lamp. Too little would leave the lamp dim. Too much would burn it out instantly. Some of the most famous electricians in the world said that the thing could not be done. Edison did it, though; and if he had not achieved this success, his lamp would not have worked. A dozen other such instances, in the career of Edison alone, could be cited. There is one, taken from the life of Sir Henry Bessemer, of England, who died a few weeks ago, having conferred more benefit on the civilized world than any other inventor of the present century, and having derived over $5,000,000 from his patents.

Forty-five years ago steel cost $250 or $300 a ton. Now it can be had for $20 or $25. The reduction in price is partly the result of the use of machinery in the operations of manufacture, and of the cheaper transportion of ore. But the chief factor in the change is the invention of Bessemer's process of making steel. Pig iron contains too much carbon. Sir Henry melted it in a huge egg-shaped flask, called a "converter," forced powerful air jets into the bottom of the latter, and thus burned out the impurities. But his invention was not complete when he made it public in 1856. He experienced great disappointment, suffered vigorous criticism and denunciation as an imposter, spent $50,000 or $100,000 in addition to his first outlay, sent all over the world for samples of ore and pig iron, and conducted elaborate chemical experiments before he learned how to overcome three difficulties that he had not foreseen at first. Nearly four years were consumed in this task. And if he had been a man of less patience, thoroughness and energy, he would have failed.

We cannot all be Edisons and Bessemers. Only a few inventors have the ready money to expend as these two men did. But they both began life as poor boys. They made their own fortunes. And they did so even more by "working out the details" themselves than they did by their "crude ideas."

Making Blue Prints.

Prints from photographic negatives or from drawings made on transparent material (like draughtsmen's designs) are frequently obtained with "ferrocyanide" paper. Such copies are called "blue prints." It would be cheaper for a man to buy such paper ready made, if he does but little work with it. Many engineers and photographers prepare it themselves, though, when they need considerable quantities.

It is necessary that the paper should be sized, to begin with. Some grades of note paper already have enough size; or ordinary albumen paper, which has not been sensitized, will do, if first dipped suddenly into boiling water to set the albumen. More porous paper may be coated with arrowroot starch, applied with a sponge, and then dried. A grade of paper, known as Rive's plain, suitable for this use, can be obtained from dealers in photographic supplies. This avoids the necessity for further sizing.

To sensitize paper by the ferrocyanide process, one should have two solutions. Put one ounce of ammoniocitrate of iron (or citrate of iron and ammonia) in four ounces of distilled water. Put one ounce of red prussiate of potash (or ferridcyanide of potash) in another four ounces of distilled water. Keep these solutions in separate bottles, which should have two or three thicknesses of brown paper pasted around them to exclude the light.

Pour equal quantities of these liquids in a clean, shallow glass dish, and mix thoroughly with a glass rod. Lay the paper on the surface, and let it float for two or three minutes. It is necessary to coat only one side. The superfluous fluid may be removed when the paper is lifted by drawing it over a glass rod. The chemicals may also be applied with a clean sponge while the paper lies flat on glass or a board. This operation, and that of drying before a fire, should be conducted in a dark room and the paper should then be protected from light in a bureau drawer in a closet. Better results are obtained with paper that has been freshly prepared than with old stock.

In making prints from a negative, one lays the paper under the latter, as in making a "silver print" or a "bromide print," pressure being used to bring the paper close against the negative. Draughtsmen lay their ferro-cyanide paper under the tracing, cover the latter with glass, and press the three together in a printing frame, that looks very much like a picture frame. Then expose to the sunlight for several minutes. Sometimes, if the daylight be feeble, an exposure of an hour is necessary. Wash the print in water until the free chemicals are entirely removed. Four or five half-minute baths will do it. Some photographers add to the sensitizing mixture five drops of a 10 per cent solution of bromide or ammonia, to make it work more slowly. And a few drops of citric or hydrochloric acid are sometimes added to the first bath into which the print is dipped when taken from the frame, but these precautions are not always observed.

THE *Review* thinks that in case war is declared between the United States and Spain it is probable that the electrical fraternity will play a very important part in whatever actions may ensue. The setting and operation of submarine and subterranean mines involve considerable technical and engineering skill and a knowledge of electrical engineering. The American Institute of Electrical Engineers numbers among its membership many expert electricians who would undoubtedly volunteer their services to the Government for such work. A number of electricians have already enlisted as privates in the two new artillery regiments recently created, and it is undoubtedly a fact that when the real need of the services of trained electricians is made apparent it will be at once met by volunteers.

Mining Summary.

CALIFORNIA.

Amador.

The Tellurium mine at Pine Grove has been bonded, and work resumed on the old tunnel. ——The Valparaiso, near Jackson, on which work ceased, has resumed. —— Questo & Co. have discovered a 4-foot ledge in the Silver Star mine, near Jackson Gate. —The Anita mine resumed sinking. —— At the Alma the bond has been extended and operations will soon be renewed.

The *Ledger* says that the completion of the new shaft on the Wildman-Mahoney mine will necessitate more stamps, and the plan is to add 120 to the 80, increasing the capacity of the mines to about 750 tons daily. The next work at the Oneida after the ledge is encountered in the new drift will be the unwatering of the old shaft. The concentrators at the Argonaut are saving a ton of concentrates per day. One-quarter of this passes over the tailings plant.

Butte.

Work will soon be resumed on the Missouri and Burlington mines near Forbestown.

At Enterprise work is being pushed on the Mecham and Bright Star. Good ore is reported in the tunnel.

At the Pactolian mine, near Hurleton, men are engaged running a tunnel. The dredger near Oroville is working steadily. They contemplate the purchase of several thousand acres of land.

Calaveras.

G. Taylor discovered a good ledge near Murphys. —— D. H. Roberts is taking out ore at the New Calaveras mine —— D. McDonald has resumed work on his Buckhorn claim. McDonald & Co. are erecting a cyanide plant on the old Calaveras group —— At the Keltz mine, at West Point, twelve men are tunneling. The ore is shipped to San Francisco for reduction and has always paid a dividend over the cost of transportation and treatment. ——The Great Eastern mine, near Angels Camp, has been bonded to C. D. Lane. The Great Western has also been bonded to the same party for thirty days for $20,000; 5 per cent of the purchase price was paid.

At the Boston mine, Mokelumne Hill, the shaft has reached 1000 feet. It is stated that the mine will not be operated this summer owing to the uncertainty of the water supply. ——The last payment of $3000 was made on the Petticoat mine at Railroad Flat.——At the Gwin mine the south shaft has reached 40 feet below the 1000 foot level of the old works. The shaft, after a lapse of fifteen years, was found in a good state of preservation. At the north shaft they are taking ore from the 1400 level at a distance of 1100 feet from the shaft. The 40-stamp mill crushes 150 tons of ore per day.

Citizen: The Lockwood property, near West Point, is being unwatered. Work has commenced on the Rowe & Jenkins, and on the Stager mines. The Champion Co. has cleaned the shaft to water level. Machinery will be erected and pumping begin. A mill test of the old waste dump, of which there are several hundred tons, netted $4 per ton. The company will erect a mill at an early date.

Chronicle: W. T. Robinson of Mokelumne Hill has secured the right to mine the Mokelumne river for a distance of five miles. He intends to use a dredger and the outfit will cost in the neighborhood of $35,000.

The price paid for the Boucher & Brackett gravel mine, in Chili gulch, by J. Burton was $3000.

El Dorado.

(Special Correspondence).—Work continues on the German mine, near El Dorado, with seemingly satisfactory results. This company recently purchased the 10-stamp mill on the Gerhart mine, on which work was discontinued for lack of capital. It was another instance of an expensive surface plant before sufficient development work warranted the outlay. The Pocahontas, with its fine plant of compressor and stamp mill, is still at the mercy of the sheriff, and the development of the mine, like the Gerhart, succumbed to the machinery, for which no grist was produced to grind. Thus the redeeming features of promising properties are lost sight of by expenditure of the limited money at disposal above ground, and the county in general made to bear the blame. The Gentle Annie mine is crushing a good grade of ore from the 400 level. The Limpensell property, under bond to Diamond & Gehricke, is sinking by contract. Power drills are in use.

A discovery of good ore in a strong ledge was made in the Flagstaff, near Grizzly Flat. The renewal of activity in taking up abandoned mines in the vicinity of Grizzly is rewarding the operators in several mines below the 700 level. This is notably the case in the Mt. Pleasant, Good Hope and Flagstaff. This resumption of work on old properties is giving an impetus to development of other properties in the neighborhood. In the northern portion of the county from the American river to Kelsey and Georgetown new life is manifest, as is evident from the reopening of the Summit and Rising Sun properties and the shafts being sunk on new properties. In the neighborhood of Garden Valley and the Taylor mine prospectors are meeting with some success in the discovery of ledges. The Boulder mine, in the vicinity of Shingle Springs, with its systematic development work, is rapidly proving itself a paying investment.

Placerville, April 4th, '98.

Kern.

(Special Correspondence).—There is an electric power plant proposed for this camp; the promoter of the scheme is J. W. Eddy, backed by capitalists of southern California. The plan is to generate power at the south fork of Kern river and transmit it to Randsburg, a distance of thirty-six miles. The different mines here have subscribed for over 500 H. P. Col. Eddy is now in Los Angeles completing arrangements to begin work immediately. The water mains for the Randsburg water works are being distributed and laid in the streets to-day, and within a few weeks we hope to have water.

Randsburg, April 4th, '98.

(Special Correspondence).—The owners of the Mammoth mine are sinking a winze and crosscutting from No. 4 tunnel. They are reported taking out ore running $40 per ton.

Welch & Gilliam have given a contract for an upraise on the Root mine, to be used as a working shaft.

The French Gulch Gold Dredging Co. have shut down and are selling off their machinery.

Lassen.

The Golden Eagle mine, at Hayden Hill, has been sufficiently developed to warrant the erection of machinery, which is being placed for the reduction of ore.

Madera.

C. A. Shattuck & Co. are developing a claim near Coarse Gold. The ledge is 4 feet and fair grade. The Gold Gulch M. Co. shaft has reached 190 feet. The pay streak is 5½ feet wide. The Krohn mine is 217 feet deep. The ledge is 7 feet wide. The ore averages $30 per ton.

Mono.

Concord & Yerrington have taken possession of the Molus mine, near Bishop, and will erect a 10-stamp mill without delay.——Tests of ore from Copper Mountain district are being made by the leaching process. If successful, the bodies of rebellious ores in that district will be thoroughly developed.

Napa.

The annual report of the Napa Con. Quicksilver M. Co. gives the following figures for the year ending Dec. 31st, '97: Net proceeds sales, $168,871; quicksilver on hand Jan. 1st, '98, since sold, $47,075; increase in cash supplies, $1621; total expenses, $123,290; net earnings, $94,277; dividends paid, $70,000.——Ætna Con. Quicksilver M. Co. gives the following figures for the year ending Dec. 31st, '97: Net proceeds sales, $101,020; quicksilver on hand Jan. 1st, '98, since sold, $25,200; increase in cash supplies, $4798; total expenses, $78,332; net earnings, $52,686; dividends paid, $40,000.

Nevada.

(Special Correspondence.) — The property owned by C. F. Wright, two and one-half miles from North San Juan, has considerable development. One tunnel has reached 135 feet on the ledge, which at some greater length will have a depth of 700 feet. The croppings are from 75 to 100 feet wide. The ore is rather low grade, averaging from $2.50 to $6 per ton, with large percentage of sulphurets. The ore chute can be traced for 1600 feet. The property is favorably situated to be operated as a quarry. Water is one-quarter mile distant.

At the Wisconsin mine near Grass Valley about fifty men are at work, mostly on the tribute system. The shaft has reached below the 700 level. The ledge is small but of fair grade.

The Pennsylvania is said to have come into a new ore body on the 700 level while making an upraise from the 800.

The North Star Co. continues drifting in the Massachusetts Hill property on the 1200, 1300 and 1400 levels. The ore is hauled one mile by wagon to the North Star mill.

The development of the Hastings gravel mine at Nevada City shows encouraging signs of an approach to the channel.

Nevada City, April 4th, '98.

The gravel mines at Relief Hill are all working. More men have been put to work recently. The Waukershaw has come into a rich pay streak. The Reddick gravel mine, near Nevada City, is said to have struck gravel that yields $15 per car.

The Live Yankee G. M. Co., near Graniteville, a local company, have completed 1400 feet of tunnel. They have expended $9000 in development. They expect to bottom the channel within 300 feet. In the Union quartz mine the tunnel has reached 400 feet. The ledge in the Mayflower is 8 feet wide and the ore is fair grade.

The Gold Flat mine is under new management. The ten miners operating it the past year relinquished their bond and it reverted to the owners, the Weissbein Bros., who have put men to work and will thoroughly develop the property. The shaft is down 350 feet.

The *Tidings* says that the Summit mine will resume operations. Work ceased on this property about a year ago because the machinery was too light for the heavy flow of water. New machinery is to be placed.

The Old Home mine, near Blue Tent, has resumed operations.

Union: Near Graniteville, in the Mayflower mine, an 8-foot ledge of free-milling ore was discovered. The California Queen, near Hombrook, struck a 5-foot free-milling vein of good ore. This mine was worked fifteen years ago, but the ledge was lost and has been idle until recently. The ledge was found within 2 feet of where the former owners quit.

Union: The Pennsylvania mine at Grass Valley has uncovered a new ledge on the 700 level, and within thirty days fifty stamps are to be added. Kidder & Brown have sold their interest in the property to Clinch & Thomas Bros. Fifteen loads of ore from the Norambagua mine yielded $40 a load.

Placer.

R. L. Dunn contemplates the erection of a cyanide plant at the Dardanelles mine, near Forest hill.

Plumas.

Hill & Schneider are developing a quartz property at East Branch.

Riverside.

A discovery of an ore body of good value is reported from the north end of the county. Adams Bros. are the owners of the property.

San Diego.

(Special Correspondence). — The Helvetia mine, in the Julian district, is reported sold at a good price. On the 1st inst. the Ranchita mill and mine resumed work, after a brief idleness. The Ranchita is one of the best producers in the Banner district. The air compressor is in place on the Kentuck, near Banner, and the 1200-foot tunnel will be commenced in a few days. M. Holland of San Diego, who owns an extension of the Ranchita, recently milled several thousand dollars worth of $30 rock. The North Star mine, in the Banner district, is reported sold at a satisfactory but not named price. Development work was resumed on the Mountain View mine, near Stonewall, on the 1st, after two months idleness, owing to bad weather and snow on the ridge. The Laguna M. Co. has received a request for price per ton f. o. b. at San Diego for 100 tons of their high-grade stibnite ore.

San Diego, April 2nd, '98.

Receiver Pauly of the Golden Cross mines in his third report, which covered the month of January, shows that the clean-up amounted to $44,941.48 and there was paid out $29,669.69. Returns from other sources amounted to $1186 88. There were 218 men employed during January.

San Joaquin.

A. Rosenbauer of Stockton, whose weather predictions are said never to have failed, has wagered $4000 that there will be 1½ inches of rainfall during the current month.

Shasta.

A half ton of silver ore from the Igo district produced 200 ounces silver and some gold.——In the Muletown district P. W. Pyne sold the Golden Jubilee group to Mooer & Johns, who will continue development.——Wise & Co. are running a tunnel on a ledge of fair grade ore. ——The Midas M. Co., near Hall City, employs sixty men, and is producing good values. The cyanide process is in use. Capt. Roberts contemplates erecting a hoisting plant on the property.

M. B. Butler & Son have struck a body of good ore in their mine near Delta. The property is well developed. Heretofore the ore was worked by arrastra, but the new find gives opportunity for larger operations. A contract has been made to crush 200 tons at a custom mill. Hicks, Travers & Co. have also contracted to crush 200 tons from their mine at a neighboring mill.

Development work is pushed on Harrison Gulch and Hall City properties. Boswell & Johnson are opening a claim near Hall City that is reported promising.

Democrat: F. Panter has tapped the lode in the Evening Star at Whitehouse. The ore is high grade. The National Con. has ten stamps in operation and employs thirty men.

It is reported that copper ore has been found near the Altoona quicksilver mine.

Sierra.

It is creditably reported that Supt. Jones has reached a gravel deposit in the Lucky Dog property of good depth that is paying $6 per load.

The Plumbago mine continues its rich yield both of good milling ore and of specimen production in fair quantity. The last output, shipped this week, is $12,000.

Siskiyou.

The tunnel on the Hazlit mine near Henley has reached 500 feet on a 6-foot vein that averages $12.50.

The Cherry Hill mine near Yreka has struck the ledge at a depth of 650 feet. The ore returns good values and carries both silver and gold.

The Siskiyou M. Co., near Happy Camp, is reported to have realized $19,000 from three months' work. The property is on the Klamath river, about fifty miles from Yreka.

News: C. E. Humphreys at Barkhouse realized $1150 from fifteen tons of ore. White & Musgrave discovered a 4-foot ledge near Humbug, from seven tons of which they realized $25 a ton. A 2-foot vein of ore was cut in the Hunter mine at Cherry Creek. Work on the Smith mine is progressing. They are working a 2-foot ledge which averages $15 per ton. Costello & Hart have a 200-foot tunnel on a 15-inch ledge.

Trinity.

The Highland mine at Cox Bar has made two satisfactory cleanups, but is making short runs for lack of water.——Connection has been made in the LaGrange tunnel. The accuracy of the survey and the work is shown by the fact that at the place of meeting the bottoms of the two tunnels differed only three-quarters of an inch and the sides but a few inches. The tunnel is 8409 feet long, 6x7 feet, and has a grade of 10 feet to the mile. Work was begun on it July, 1895, and from that time forty men were employed. The water of Stuart's Fork will be turned through it and will afford a constant supply. A complete description of this property, together with illustrations, was published in the MINING AND SCIENTIFIC PRESS Feb. 19th.

Searchlight: The placer properties of Junction City and vicinity have not experienced the hardships of the smaller properties in the lack of water; but, unless an unexpectedly wet spring ensues, the hydraulic season of these properties will be materially curtailed. The Cle Fse mine at Junction City, through the means of an inverted siphon and extended ditch line, is furnished an abundant supply of water from Canyon creek. Fifty men are employed. At the Chapman & Fisher mines, near Junction, the reservoirs have been slowly accumulating water and hydraulicking has been slow. The Haas mines at Junction City depend for water on Clear creek, and operations have been seriously affected. At this time last year three clean-ups had been made, against one for this year. Sheridan Bros. mine has been correspondingly retarded. The Gribble mines have accomplished practically nothing, owing to the poor season, while at the Murphy mine Supt. Giezan manages to pipe only a half hour daily. Some work has been done at the Burger and Dannenbrink mines and the Wallace properties. Markwell & Keenan are doing considerable sluicing. At the Red Hill mines the short rain supply has been keenly felt. Fourteen men are employed. For ten months water has been securable less than eight hours daily. Four giants are used.

Tuolumne.

Democrat: The Dead Horse mine at Summersville is sinking in the main shaft, which has attained 1450 feet. The vein in the bottom shows 4 feet of ore. The Birney & Wainwright pocket claim on Bald mountain last week produced $1300. The Spring Gulch mine will soon be reopened. The Lady Washington changed hands on the 1st of April; the new owners will start a shaft on the ore chute. The Agnes mine is being developed by W. H. Storms. The property contains two veins, one low grade, the other carries an average width of 10 inches sulphide ore. The Tri-Color Con. M. Co., who will operate the Patterson properties near Tuttletown, have plans for a 50-stamp mill, and made surveys for the power plant. The company has sufficient power to operate 100 stamps, summer or winter.

NEVADA.

The Boston-Nevada Co., operating in Mason Valley, has 400 tons of copper ore ready for smelting.

S. G. Weston has sold the Cuag group, near Mountain City, to New York capitalists for $75,000. The property is principally copper, but carries gold and silver. The company contemplates the erection of smelters.

The Cuyahoga G. M. & M. Co., composed of Ohio capitalists, have secured three claims near Dayton and begun development. F. C. Everett is Gen. Mgr. It is his intention to put a mill on the property this summer.—— The Delphi M. Co., composed of Ohio people, secured three claims in Smith valley and will operate them extensively. Much development has already been done. Work will be pushed and possibly a cyanide plant erected.

The Heleza Placer M. Co. has secured 700 acres of gravel near Carson and is preparing to bring water on the ground. Seventy yards of gravel hauled one and a quarter miles for washing yielded $3.70 per yard for thirty-five yards, and from thirty-six yards $4.17 per yard was obtained.

OREGON.

Bradbury Bros. made a good quartz find near Baker City.——The Bonanza mine, near Baker City, has an annual output of $300,000. Extensive improvements are contemplated in both mine and mill. A. Geiser of Baker City is Pres. of the company.

WASHINGTON.

At the Schoop-Nader placer bars on the Pend d'Oreille work is progressing. Of the tests made, none have failed to show colors.

The Republic M. Co. No. 2 at Republic received $20,000 from C. S. Warren as trustee for 250,000 shares of stock, the money to be applied for development purposes.——F. H. Oliver, as agent for Butte and Spokane men, paid $25,000 for a half interest in the Lost Lode claim at Republic.——The Quilp claim at Republic has begun development work. The property is owned by Spokane people.

The Rebate mine at Republic has been bonded to J. M. Burke, for a company, for $30,000. Three shifts have been put to work. ——The San Poli mine came into a new ore chute that assays $24 gold.

BRITISH COLUMBIA.

(Special Correspondence).—The Channe M. Co. are working their Hanson island properties, Phillips Arm district, north of Vancouver city. They claim that assay certificates show that 2 feet of the main ledge will average $28, chiefly copper, and 4 feet will average $14, and that concentrating test showed the ore would reduce from ten and one-half to one ton. The company are shipping their $28 ore continuously to Swansea.

Two matting plants are being arranged for coast properties. A combination of the Vivian and Swansea people will erect one, it is said, to handle coast ores, while E. Blewett and Chicago capitalists have a matting plant en route from Chicago capable of treating 100 tons a day. Mr. Blewett states that the plant will be erected either on the island of Vancouver or in the suburbs of Vancouver.

Free milling properties continue to be a great disappointment on the coast, as far as actual results are concerned. All of them start out as high-grade propositions with small-dimension mills, and most of them turn out low-grade propositions which will take a large amount of money and much care to work. British Columbia has proven to date to have six or seven low-grade free milling mines, but no high-grade ones.

At Lillooet the Golden Cache is being worked as a low-grade property. The company now claim a rich narrow pay streak running through the ledge, assaying $200 to the ton, and the whole ledge mineralized, the rest of the ledge outside of the pay streak running sufficiently high to give a return of $1 a ton above expenses.

Vancouver, B. C., April 4th, '98.

The ore and matte shipments from Nelson for the week ending March 26th amounted to 2051 tons, of an approximate value of $86,560. The shipments for March are 9049 tons, valued at $371,949, and for 1898 up to date 27,227 tons, valued at $2,718,576.

Up to the 7th ult. the Government granted eighty-four leases for dredging in the Yukon river and tributaries, covering a distance of 1184 miles. The revenue derived from these leases is $110,000.

The net earnings of the Whitewater mine in the Slocan to March 26th last amounted to $194,000.——The Enterprise mine has 600 tons of ore at Slocan and is working thirty men. ——J. M. Harris of Sandon will ship to Swansea, as an experiment, 100 tons of zinc ore.—— The Hall mines' results of the company's smelting operations for the twenty-two days ending the 25th ult. are 5436 tons of ore smelted, yielding 321 tons of matte, contain-

ing 125 tons copper, 77,020 ounces silver, 402 ounces gold.

The Cariboo M. & S. Co. at Camp McKinney intend to purchase an additional twenty stamps. They have acquired an option on several adjoining properties for $30,000. The Golconda group has been bonded by the British Columbia D. Co. for $35,000.

ALASKA.

(Special Correspondence).—Skaguay presents the appearance at its docks of a metropolitan port. The great number of passengers arriving and the freight unloaded here give it importance. The wharfage is fairly good. Four large warehouses are completely packed and a fourth is in course of construction. At present the ground is frozen, but when the thaw begins the present sea of ice and frozen gravel will make this embryo city one sea of mud and slush. The trip over the summit, however, is preferable from Skaguay, as the road is not steep and only 2800 feet of an elevation, as against 3500 over the Dyea route.

A fairly good wagon road has been built for twelve miles on the Skaguay route. The toll charged for freight over this road is 2 cents per pound. The report went out that miners would refuse to pay the toll, but this seems unfounded. At any rate, the Government has issued instructions to protect the owner of the road.

I have had a number of quartz samples submitted to me which, in a horn test, ran from $60 to $70 per ton. There is a good percentage of sulphurets, but I have no means at hand to assay their value. The reported rich gravel finds on the Big and Little Salmon rivers and in Walsh gulch are rapidly depopulating Skaguay. There will be considerable prospecting done this summer all along the coast from Victoria, and on the Sound and the islands as well. That the opportunities are not so favorable for quartz mining here as they are in California needs no explanation. Nevertheless there will be considerable enterprise expended in this line in Alaska this year, and it will give mining in general a strong upward tendency.

The new gravel discoveries, of which I spoke in the outset, are approximately from 80 to 100 miles from Selkirk in an easterly direction. As they are in line or in the same belt as the Klondike fields, it is thought they will prove equally rich.

Skaguay, March 25th, '98.

THE KLONDIKE.

In addition to the plans of the Geological Survey for exploration in Alaska, the Treasury Department is starting four expeditions to explore the Yukon river, Copper river and other water routes of the Territory, Congress having appropriated $100,000 for the purpose.

IDAHO.

(Special Correspondence).—J. S. F. Batchen and twelve others have sold a placer tract of 250 acres on Boyle, California, Wolf and Granite creeks, near Placerville, to the Blue Rock Dredging Co. of West Virginia for the stated price of $15,000. The purchasing company purposes putting in a dredging plant with a capacity of 3000 cubic yards per day.

Placerville, March 31st, '98.

The Hiyu mine, near Florence, has a new vein 20 feet wide. The company will add concentrators, a heavier hoist and additional stamps.——The first payment of $2000 was made on the Sunset group, near Wallace.

There is 8 feet of snow on the level at Pierce City. The indications are that considerable placer mining will be done in the vicinity of Pierce the coming season.

An ore body of good values has been opened in the Illinois mine, near Idaho City. Two dredges are being built to operate near Placerville.——The Morning Star mine, near Grimes Pass, is running day and night, and water is ample.

The mill at the DeLamar formerly run on the pan amalgamation process has been replaced by the new cyanide leaching plant. The *Avalanche* says ten iron leaching tanks, 10x20 feet, of a depth of from 3½ to 4 feet, each with a capacity of about twenty-five tons, are in operation. The ore after being crushed to admit it through a 1-inch screen goes to the leaching tanks, two of which are filled and two discharge daily, making the present number of tons treated each twenty-four hours about fifty. The ore is placed loosely in the tanks, not packed, and the cyanide solution, piped from two large storage tanks, is slowly percolated throughout the mass. Four days later the solution is washed and drained into a sump tank below the leaching tanks, and from there pumped up to the precipitating tanks in the upper story. It is then forced through a filter press, consisting of twenty-four chambers, the sediment caught by canvas-covered plates, and the cyanide drained off and returned to the storage tanks. The plates are cleaned up every two weeks and the product forwarded to refiners and smelted. The management intends to increase the capacity to 150 tons daily.

UTAH.

R. H. Aiken will put men to work on the Gold Bug group of claims at Deer Lodge, on which he has a $60,000 bond. Forty men are employed in the Charlie Ross group. The vein is over 100 feet wide. The Inter-Ocean tunnel is being pushed with three eight-hour shifts.

The Robinson group, at Deep Creek, has accumulated large ore quantities awaiting shipping facilities. The assays show from 14 to 57 per cent copper, twenty to eighty ounces silver and $1.80 to $18 gold per ton.

The sulphur beds at Cove will be enlarged and improvements made in the plant. Meyer Bros. & Co. of St. Louis, who own the property, have imported the greater portion of sulphur in their wholesale drug trade from Sicily and Japan, but the Sicilian supply has been curtailed and restrictions placed on Japanese exports owing to the diminishing supply there. These two facts make the Utah supply more valuable, and the owners have determined to lend their energies toward making a new market for the local product.——Green & Co., owners of the Mignon group at Manning, made a strike of free gold ore which yields good results.——Good ore is being taken from the 1300-foot level of the Bullion-Beck at Tintic. Seventy-five tons is being hoisted daily and when the new shaft is completed 125 tons per day will be taken out.——A body of shipping ore has been discovered on the 350-foot level of the Lower Mammoth, assaying 35 per cent lead and forty ounces in silver.——The Four Aces struck an ore body that shows in the first grade sixty-six ounces in silver, two-tenths of an ounce gold and 43.5 per cent lead. A lower grade assays 22.4 ounces in silver, two-tenths of an ounce gold and 9 per cent lead. The vein from which the better ore was taken was discovered at a depth of 630 feet and is 1 foot wide.

The Mammoth mine will soon erect a 50-ton cyanide mill.——Dalton & Lark will resume work on their placer property near Bingham.——The Spanish mine is producing two carloads of forty tons daily of ore averaging 30 to 40 cent. A second ore body was opened in this property, 7 feet wide, carrying 45 per cent lead.——A new ore body was struck in the Julia Dean, from which regular shipments will be made.——A large vein of good grade ore was uncovered in the Hooper mine.——In the Highland Boy the tunnel has been driven 640 feet. Power drills have been installed recently.——The lower tunnel on the Greek group has penetrated 10 feet into the vein, in which seams of good ore several inches wide are exposed.

The water in the Silver King mine, at Provo, has widened to 3 feet. The results of the last assays were $20.90 per ton, and the tailings cyanided yielded 31.3 per cent. The management contemplates putting in a combination cyanide and concentrating mill.

MONTANA.

At the Broadwater mine, Neihart, operations are carried on through three tunnels of 2000 feet each; the ore is sulphide.——The Big Seven mine produces silver-lead ore of high grade. It has been a producer the greater part of the past year.——At the Florence mine the main shaft is 300 feet deep.——At the Galt mine three tunnels have been driven on the vein. The main tunnel is 1800 feet.

The Butte Monitor Tunnel Co. has incorporated, with a capitalization of $300,000.——It is announced at Marysville that the cyanide plant of the Montana M. Co. will start the 10th of this month. The past winter the company has erected two leaching tanks, making four in all, of 400 tons each.

Wallace & Co. at Sterling are extracting good ore.——The Sparrell & Luther mine, near Sterling, has fifty tons of ore ready for shipment.——The Arkansas struck a 10-inch vein of high-grade ore.——The Monitor mine shipped a carload of ore that netted $238 per ton. The Monitor is shipping thirty-six tons a week, though a lower grade.——The Pilot mine at Clancy will be reopened. The G. & B. shipped a carload of ore last week.

The Nellie Darby mine, at Sheridan, is producing ore that runs from 40 to 97 per cent lead, 20 to 38 ounces silver and $3 gold.——The Hawkeye, near Twin Bridges, has a vein 4 feet wide producing $80 per ton in gold, silver and lead.——The Thistle, at Rochester, has reached 240 feet depth; the length of ore chute exposed is 300 feet on the 200 level; the vein is 2 feet wide and runs $70 gold, 5 per cent lead and three ounces silver.

The number of men employed in the mines of Butte is about 5000, divided as follows: Anaconda 1600; Boston & Montana 700; Parrot 400; Montana O. P. Co. 300; Colorado 300; Butte R. Co. 350; Alice Co. 225; all others 1100.

The Boston & Montana has let a contract for the building of a new blast furnace at Great Falls, which will add one-third to capacity of the plant.

SOUTH DAKOTA.

The Holy Terror mine in Pennington county is producing gold bullion from a 10-stamp mill at the rate of $35,000 per month.——At the Golden Crest, at Two Bit, the shaft is down 120 feet. Bunches of ore run $100 to the ton.

The smelter that was destroyed by fire at Deadwood will be rebuilt so soon as the insurance can be adjusted. This announcement is made by Dr. Clark of Lead City, who, together with Swift Bros., owns the property. The insurance on the smelter was $100,000.

WYOMING.

Rock Bros. have bought a three-fourths interest in the Golden Ruby mine at Grand Encampment for $12,000.

G. Nebeker began development of the soda deposits at Green River. He expects to manufacture caustic soda and deliver it at Chicago for $15 per ton, $17 less than the present market value of the product at that place. He has secured 550 acres, which covers all the deposit known to contain carbonate of soda. Plans have been prepared for a plant of twenty-five tons daily capacity. That at Green River is the only known deposit of carbonate of soda in the United States. The liquid carries 10½ per cent of the carbonate.

A new mineral district has been discovered in Uinta county, which extends from a point three miles south of Evanston to the Utah-Wyoming line, and in places is several hundred yards wide. The ore is a decomposed formation.

MICHIGAN.

The Quincy M. Co., at Houghton, will enlarge its stamp mill this season, and also sink shaft on the Mesnard property.

ONTARIO.

At the Olive mine, near Portage, the shaft has reached 160 feet. The vein, though small, mills $45 per ton. The mill treats six tons every twenty-four hours. Another shaft is being sunk, and, when the mine is thoroughly prospected, if occasion warrants, a larger milling plant is to be constructed.

COLORADO.

(Special Correspondence).—A recent discovery in the Golden Age mine of Jamestown, in the 700-foot level, was a small pocket of specimens, the market value of which was $200 per pound. A second lot of twenty-three pounds from the same pocket netted the leasers $50 per pound, while sixty-six ounces of gold was panned out from the fine dirt which accumulated while extracting the specimens. The ore is a black telluride. Besides this, a shipment of two tons of an ordinary grade was made to the sampling works.

In the 900-foot shaft of the Slide mine the vein of sylvanite is from 4 to 10 inches thick.

In the 800-foot level of the Golden Age mine mineral is found, the first-class running from $25 to $30 per pound.

In Wall Street Camp abandoned properties have been cleaned out and put in shape for extensive operations.

The Gold Extension M. & S. Co. owns 110 lode claims in Sugar Loaf district. These will be tapped by the Wall Street tunnel and open good mineral sections. The tunnel is supplied with double track, air compressor and machine drills. The fuel used is distillate, one of the by-products of petroleum, costing less than one-half as much as coal.

Boulder, April 2d, '98.

With the completion of the Colorado & Northwestern Railroad from Boulder to Sunset the expense of freighting the ore from the mines to the sampling works and smelters is reduced over one-half, and the low-grade mines idle for years will be reopened and operated on a paying basis.——In the new mining camp of Wall Street, C. W. Caryl has bonded and located 110 mining claims and located a tunnel site 6000 feet in length. The face of the tunnel will be 1300 feet below surface. Development has begun.

The Little Johnnie at Whitehorn was sold to Wider & Collins for $25,000 and a royalty of 12½ per cent for one year. The 7-foot vein assays $28 in gold.

The gold output of the Cripple Creek district for March is estimated at $1,200,000.——The Arkansas V. S. at Leadville has 600 men on its pay-roll and is receiving 500 tons of ore daily.——Owens & Co. are shipping eighty tons of iron ore per day from the Result mine.

The Silver Peck mine at Telluride, ten stamps, produces a carload of concentrates daily, which net from $2200 to $2600 per car—a monthly output of from $65,000 to $80,000. Between the sixth and seventh levels there is said to be enough ore to last three years at a consumption of forty to forty-five tons daily. While the pay streak is only 5 to 10 inches in width, the ore runs $50 and upward in gold per ton. The force has been kept up to near 100 men. The mine has two miles of working ground opened up.

The Sedalia mine at Leadville is daily shipping sixty tons of gold ore.——The Little Ella is shipping ore that produces half-ounce gold, 30 per cent lead, and twenty ounces silver.——The Battle Mountain district in Eagle county is shipping eight carloads of ore per week.——The Zerlite at Victor shipped a car of ore that ran $30 per ton.——The Gold Sovereign mine at Cripple Creek made a shipment from the Whisper shaft; six tons ran eighteen ounces.——Out of the Silver lease a ten-ton shipment of thirteen-ounce ore has been made.——From the Lovett shaft a twenty-two-ton shipment returned in two grades fifteen tons three ounces and seven tons fourteen ounces. All this has gone out in the past ten days.

The Grand View mine at Rico shipped two carloads of ore, an iron oxide that carries 400 ounces of silver per ton.——Thirteen cars of ore were shipped from Rico last week. The shipments of 1897 as compared to those of the same period in 1896 were 109 cars against 225 to the end of March.——Judge Hallett rendered his decision in the injunction proceedings brought by the Portland Co. and the Creede & Cripple Creek Co. against the Uinta Tunnel Co. Both suits were brought to restrain the tunnel company from driving through claims owned by the plaintiffs. In the Creede & Cripple Creek Co.'s case the application for an injunction was denied, as the tunnel had been driven through the claims before the bill was filed and no property of value was taken.

Returns of two carloads from the Johnstone lease on Bull Hill, sent out in two grades, first-class brought $285 and second grade $70 per ton. The ore chute is from 3 to 4 feet wide and 72 feet long. The output will reach 100 tons per month.——G. Hummer secured a lease on the E. Porter Gold King for eighteen months for $100,000. —The Cecil mine, near Central City, made its first shipment, which is said to have yielded $30 per ton.——Little Champion mine at Idaho Springs is producing both milling and smelting ore.——The Centennial, near Georgetown, opened a 14-inch streak on the 600 level that runs $50 in gold and copper.——The Headright has been reopened and new ore bodies have been found. The shaft has reached 220 feet.

The Denver *Republican* says that one of the effects of the decision rendered by the District Court at Colorado Springs will be to release the injunction restraining the Orphan Belle Co. at Cripple Creek from paying out the dividend of $100,000 it declared several weeks ago. The payment of this sum to the stockholders will leave the company something more than $10,000 in the treasury. The option disposed of nearly all of the holdings of the company, but there is yet coming on the sale of the property to the Dickerman syndicate $125,000, due Feb. 10, 1899, and in addition to this the company received 20 per cent royalty on all ores mined up to the time the final payment is made.

It is stated that the Lillie Co. netted $50,000 from its March output, being the proceeds of 1200 tons of ore.——The Corey City mine at Silver Plume shipped a lot of ore, the first grade running 33 ounces silver and 18 per cent lead; the second ran 108 ounces silver and 9 per cent lead.——The Bismarck sent out fifteen tons that yielded 270 ounces silver per ton.——The Bullion, near Ophir, shipped eleven cars of ore last week.——At Jimtown the Golden Age made a strike that is producing $30,000 a month. The vein, which was a rich producer fifteen years ago, was again found. The mine employs sixty men.——The Rip Van Dam, at depth of 300 feet, found ore that runs $80 per ton.——The Franklin at Boulder produced in the past year $18,000 from 548 tons.

The Geiger mine at Ward has 250 tons of ore ready for shipment. The shaft on the

On May 20th the Johnson-Locke Mercantile Company will dispatch from San Francisco the Steamer "Tillamook" for Dutch Harbor, Nunivak Island and St. Michaels.

This will be the First Steamer Sailing this Season for the North. The Attention of Owners of River Boats Outfitting at Dutch Harbor or Nunivak Island is Called to this Early Departure. As the Space on the "Tillamook" is One-Half Engaged, Early Application for the Remainder is Necessary.

The "Tillamook" will Also Connect at St. Michaels with River Steamers for Dawson, and the Opportunity for an Early Trip up the Yukon River is thus presented. Apply to the JOHNSON-LOCKE MERCANTILE CO., 609 Market St.

Plateau mine has reached 430 feet and has 2 feet of ore.

NEW MEXICO.

The Queen M. Co. is pushing work on its properties near Coon. The 10-stamp mill is in operation and forty men are employed – Weatherby & Kitt continue work on their group and are meeting with good results.— The Little Finnie Co. has eight men employed repairing shafts and drifts and placing the property in shape. It is said that active operations will be resumed soon.

A. L. Schumaker has cut a vein near Riconada, said to be 100 feet wide, that averages from $3 to $11 gold. J. P. O'Connor of Santa Fe will build a dredge near Clemgilla. He also contemplates putting in electric power for the operation of dry washers. T. J. Mcquiston shipped a carload of ore from the Copper Hill mine at Riconada that returned $15 per ton gold.——At Whitewater the Confidence mine is producing eighty tons of ore per day, operating thirty stamps, and employs seventy men.—— The Copper Zone M. Co. owns fourteen claims near Watrous that has six parallel veins. The property has been opened by cuts and shafts from 50 to 340 feet in depth. The veins run from 20 inches to 4 feet in width and run about 60 per cent copper. Fifteen men have been employed for a year on development work. A concentrator is to be added shortly. C. A. Scheurich of Santa Fe is Sec'y. of the company.

The San Pedro copper mines in south Santa Fe county, which employed 1000 men in 1882, will resume operations shortly.——The Morning Star and Climax mines at LaBelle are producing ore of shipping quality.——Work will be started this month on the Good Hope mine, near Bland. The last cleanup from a ten days' run at the Bland mill returned 100 pounds of retorted bullion.

ARIZONA.

The Six Mile mine near Pearce has sufficient ore on the dumps to supply a mill. Further development will be pushed.——The Black Diamond copper mine has been bonded to Denver men.——At the Middle March copper mines a new ore body has been opened. There are 2000 tons of ore on the dumps averaging 80 per cent.

The Phœnix *Herald* says that the King of Arizona M. Co. contemplates a change in its mill plant.——Shipments of high grade ore are regularly made from the Matchless mine, in Pima district.——A vein of gold and silver ore of good values has been struck in the Aztec district, Graham county.——With 10,000 tons of ore on the dump, the new plant at the C. O. D. mine in Mohave county is turning out fifty tons of concentrates daily.——At the Mohave county's Tennessee mine the main shaft is 200 feet, and the levels are in pay ore. A carload of ore per day is the regular output.

The tailings of the old Harris mill at Harqua Hala, estimated to contain about $30,000, will be worked by the cyanide method. The plant will have a capacity of 100 tons daily.

The Gladstone, near McCabe, is producing good ore.——The New Year, worked under lease, is producing shipping ore.——The McCabe is producing concentrates carrying gold.——Little Jessie's cyanide plant is working with good results.——The Venezia, near Prescott, has been bonded by Tomlinson & Hall. The property has a 50-stamp mill.——The Jessie at Chapparal is operating a cyanide plant on 10,000 tons of tailings, the values extracted being $6.50 per ton. The property comprises seventeen claims. The high-grade ore is said to run from $80 to $250, and the low-grade ore from $5 to $10 per ton.——C. Born discovered a valuable ore body at a depth of 120 feet, near Chapparal.

MEXICO.

The San Jose copper mines at Linares, Tamaulipas, are worked with 300 men the year round. Shipments of copper will be made from these mines to New York this spring. These mines, owned by the N chols Chemical Co. of New York, comprise 4000 acres. H. L. Bridgeman is the Mgr.

The Avino mine of Durango was transferred to the Avino Co., composed of South African and Australian operators. C. B. Flynn of Monterey has been made managing director and will equip the mine with the latest modern machinery.

The Kansas City Con. S. & R. Co. expects to have its new smelter at the Boquillas mines ready for operation this month. It employs 25 Americans and 100 Mexicans.

The Mexican Adventure Co. of El Oro have struck the ledge of the Esperanza.——The Morelos claims were sold for $15,009.——The La Reforma claims will soon be shafted, work already being started.——The owners of La Providencia de Borda started a shaft.——The Santiago M. Co. has struck a ledge 1¼ feet wide which assays thirty ounces of silver and four ounces of gold to the ton.

A large placer discovery is reported from Colonia Pacheco, in western Chihuahua.

WANTED.—Position as Superintendent of Hydraulic, Drift, Gravel or Quartz Mine. Twenty-five years' experience as superintendent of gold, silver and copper properties. Best of references. J. C., Mining and Scientific Press.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of references. Address J. D., Mining and Scientific Press.

WANTED. A practical mining man with business ability, thoroughly experienced in mining engineering and the economical working of ores, desires a position as manager or superintendent of a quartz mine. Reasonable salary, and good references. Address "D." this office.

ASSAYER AND ANALYST

Desires position. Now occupies a responsible position. Desires change on account of climate. Address "W. W.," care Mining and Scientific Press.

MANGANESE MINES FOR SALE.

High assay; 30-foot ledge, easily reached; timber, water, etc. For particulars, address J. H. COOK, Potter Valley, Cal.

MICHIGAN COLLEGE OF MINES.

Supported by the State of Michigan. Practical work. Elective system. Special advantages for men of age and experience. For catalogues address DR. M. E. WADSWORTH, President, Houghton, Michigan.

WANTED.

Position as Manager or Superintendent of Concentrating Mill

By a man of ten years' practical experience in the construction and operation of mills containing all the latest known improved methods of amalgamation and concentration. Address F. J. M., care of Mining and Scientific Press.

Assayer Wanted

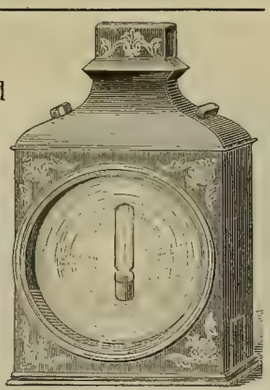
FOR CENTRAL ARIZONA.

Who has a button and pulp scale or outfit complete. Single man. Must be able to check against smelters and be thorough. Wages $60 per month, with board and room. Must furnish references as to ability as assayer, also honesty, sobriety, etc. Address ARIZONA, Mining and Scientific Press Office, San Francisco, Cal.

Practical Running of Dynamos.

A little booklet on the Care, and the Locating and Remedying of Troubles in Dynamos and Motors.

PRICE 10 CENTS.



Catalogue B. Mechanical, Electrical and Mining Books sent free.

PHILADELPHIA BOOK CO.,
15 S. Ninth St.....Philadelphia, Pa.

A BARGAIN.
One No. 1 Dodge Pulverizer
(With Challenge Ore Feeder).

Capacity, 20 to 40 tons per day. Weight, 18,600 lbs. This mill is in perfect condition, having been in use but two weeks. Price, $1000. Address "Pulverizer," care Mining and Scientific Press, San Francisco, Cal.

KNIGHTS' WATER WHEEL.

For full particulars, send for descriptive catalogue.

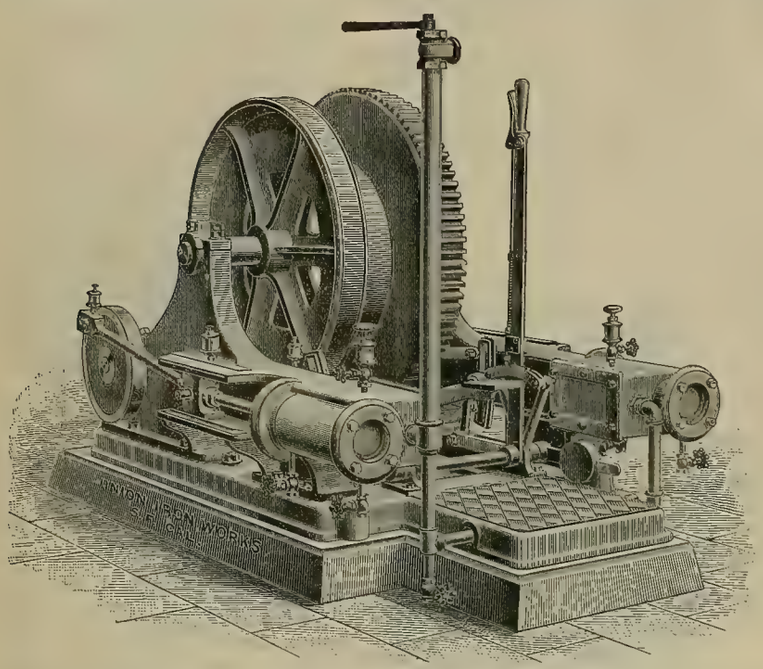
The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel** of which there are **hundreds in use** in different States of the Union.

These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**

Address all communications to **KNIGHT & CO., Sutter Creek, Cal., or, RISDON IRON WORKS, Agents, San Francisco, Cal.**



W. & P. Prepared Roofing.
One ply. Cheap. Good for two or three years.
Three ply. A first-class roof.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

ERASTUS S. BENNETT, President. SAMUEL DEXTER HAYWARD, Vice-President. D. F. COOPER, Secretary.

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT Amalgamator Manufacturing Co.,

DENVER, COLO., U. S. A.

—WORKS:—

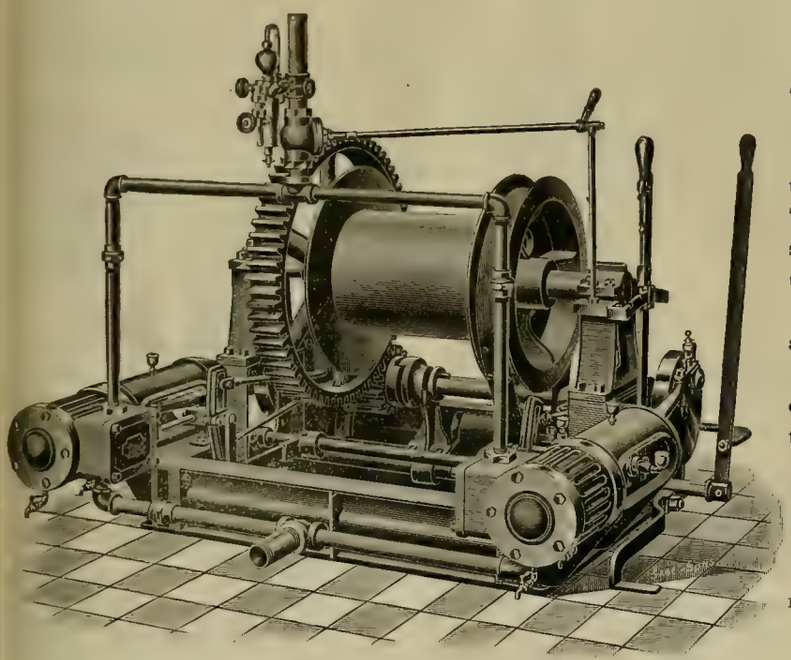
Cor. 36th and Wazee Streets, DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.						SWAMP AND RIVER-BED PLANTS.					
Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.		Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant	4...	2500	2 to 4	Barge	250 tons	Single amalgamator
2...	5000	2 to 3	50 to 300	300 tons	Duplex operating plant	5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant						

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.



All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

BAKER & HAMILTON,

HIGH GRADE

Engines, Boilers,

ICE MACHINES, MINING TOOLS, Etc., Etc.

THIS CUT represents one of our improved **DOUBLE CYLINDER STEAM HOISTING ENGINES.** We have them in sizes from 12 H. P. up (with or without boilers). They are constructed with the greatest care by engineers familiar with the best previous practice. They come with sectional iron frames, reversible link motions, etc., consequently can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also have them with the Single Engines from 6 H. P. up; Boiler and Engine contained on same frame.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WRITE FOR PRICES; THEY WILL INTEREST YOU.

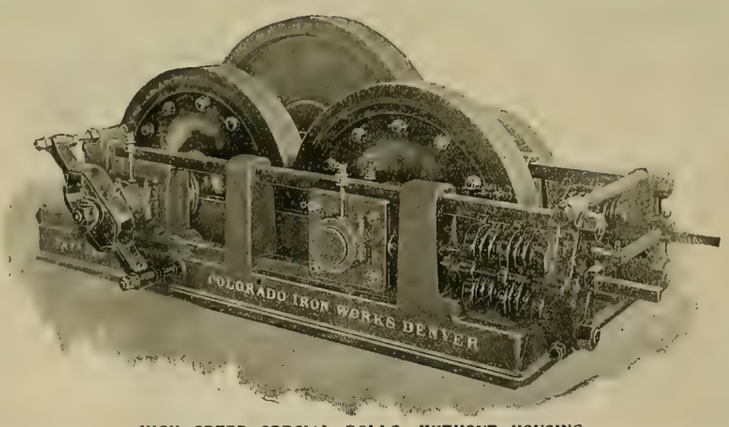
BRANCH HOUSES.....SACRAMENTO AND LOS ANGELES.

Factory, BENICIA, CAL.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. ✦ ENGINEERS AND MANUFACTURERS OF **Ore Milling and Smelting Equipments.**



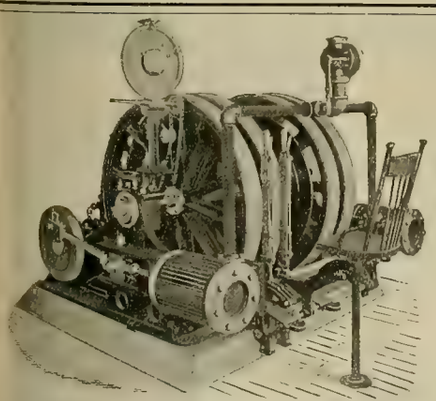
We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.



HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

10 x 12 LIGHTNING QUADRUPLE FRICTION HOIST.

Whatever is popular deserves attention.—*Thackeray.*

Unquestionably the Most Popular Friction Hoist in the Market is the

Bolthoff Lightning Quadruple Friction Hoist.

Requires less power to apply and gives better contact for friction surfaces than the double friction types. By carrying the brake band between the frictions the strain is reduced to a minimum.

COMPLETE HOISTING OUTFITS CARRIED IN STOCK.

Hendrie & Bolthoff M'f'g and Supply Co.,

1601-1615 SEVENTEENTH STREET, DENVER, COLORADO.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, April 7, 1898.

No material change in staples is reported during the week, a drop in coal being the most noticeable feature. The Alameda, from Australia on the 6th, brought 44 gold bars—$327,375—from Auckland and $2,000,000 in sovereigns from Sydney, making a total of gold imports from Australia of over $16,000,000 in the last six months. Specie exports from San Francisco during January, February and March aggregated $15,466,951, and included $1,058,800 in silver bullion, $621,893 in Mexican dollars, $13,577,696 in gold coin and $21,896 in silver coin. Of this amount $1,395,250 went to China, $320,100 to India, $97,000 to Honolulu and $13,618,000 to New York.

Silver closed in London and New York today at 25⅞ pence and 55¾ cents per ounce, respectively. Refined silver per ounce, 1000 fine, in this city is 56 cents; Mexican dollars, 45½c. Copper, New York price, 11.75@12; local ingot casting, 13½; sheet, 16¾. Pig tin is quoted here at 15. Lead, New York, 3.75; local, pig, 4¾@5. Quicksilver, domestic, $40; export, $37. Chemicals are unchanged.

Mining Share Market.

The market closed drooping last week. During the months of January, February and March sales on the regular calls of the S. & E. Board aggregated 474,685 shares. Prices opened weak on the 4th, but, influenced by the inspection of Sierra Nevada, the north end stocks sold higher. That there is a favorable feeling around is evinced by the fact that at the sale of Potosi for non-payment of the recent assessment there were but 74 shares of the 112,000 delinquent. During the 5th, 6th and 7th there was a little movement at better prices. A Supreme Court decision in the Hale & Norcross suit is daily expected and pointers thereon have depressed the stock. Sierra Nevada, Alta and Occidental are well spoken of. Nothing of importance is to be noted in the official reports during the week.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

Water Wheels and Motors.

IMPULSE WHEELS OR TURBINES furnished to suit requirements of every case for large Mining Plants, Transmission Lines, Railways, Mills, etc., or in small units for Lathes, Saws, Elevators, etc.

Assessment Notices.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of March, 1898, an assessment (No. 11) of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 59, Nevada block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 3rd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 59, Nevada block, San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING Company.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of March, 1898, an assessment (No. 13) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 11th day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, sixth floor, San Francisco, California.

RICHMOND GOLD MINING COMPANY.—Location of principal place of business San Francisco, California; location of works, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of March, 1898, an assessment (No. 2) of 1 cent per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 406, No. 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of April, 1898 will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

L. R. TUTTLE, Secretary.

Office—Room 406, No. 328 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the eighth (8th) day of March, 1898, an assessment (No. 64) of twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the third (3d) day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

TUBER MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, Panamint district, Inyo County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 22d day of March, 1898, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of May, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 2d day of June, 1898, to pay the delinquent assessment, together with the costs and expenses of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of March, 1898, an assessment (No. 33) of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1898, shall be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 10th day of May, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of March, 1898, an assessment (No. 13) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of March, 1898, an assessment (No. 45) of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 28th day of April, 1898, at 11 A. M., to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Room 22, Nevada block, San Francisco, California.

CHURCH GOLD MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, El Dorado, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 23d day of March, 1898, an assessment (No. 1) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary at the office of the company, room 15, Nevada block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 23d day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. P. SWAIN, Acting Secretary.

Office—Room 15, Nevada block, San Francisco, California.

DELINQUENT SALE NOTICE.

KATE HAYES MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, North San Juan, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 25th day of February, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Wm. T. Thomas.....	20	157	157 00

And in accordance with law, and an order from the Board of Directors, made on the 25th day of February, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, room 24, 320 Sansome street, San Francisco, California, on TUESDAY, the 26th day of April, 1898, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Wm. Nolden and C. Kaber, in the Aureole mine, near Oleta, Amador county, to deposit tailings in Deadman creek, and from George Beattie, in the Beattie mine, at Georgia Slide, El Dorado county, to deposit tailings behind the dam of the Gold Bug mine, in Canyon creek, gives notice that a meeting will be held at room 59, Flood building, on April 11, 1898, at 1:30 P. M.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1971.—VOLUME LXXVI. Number 16. SAN FRANCISCO, SATURDAY, APRIL 16, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Typical California Gold Mine.

The Dutch mine, illustrated herewith, is a steady producer, on the mother lode, Quartz mountain, Tuolumne county, Cal. It is an old property, located in 1856, and was being worked with varied success in a small way when it passed into the hands of the Dutch Mining and Milling Company, the present owners, a San Francisco corporation, organized under the laws of the State of California October, 1893. Prospecting was pushed until January, 1895, when work on a larger scale began. A shaft was sunk 420 feet, the utmost depth attainable by the machinery then in place, at which time drifts were run on the second, third and fourth levels. A 5-stamp mill was erected in September, 1895, and run until the following April, when a second battery of five stamps was added. In the latter half of 1896 the shaft was straightened and enlarged into a three compartment shaft and hoisting works erected which will enable the company to sink 1500 feet. Some old workings on the north end of the mine were opened out and retimbered, together with the shafts connecting them with the surface, and connected with the new ground the company was opening up. Last June ten more stamps were added, making twenty stamps in all, and sinking started below the 420-foot level, since which time the mine has been running satisfactorily. The present plant consists of a double-drum steam hoist, a 20-stamp mill, ten 4-foot vanners, rock breaker, etc., run by steam power. A Gates canvas plant is in operation, and a ten-drill air compressor is being put in. The main shaft is now 700 feet deep, sinking going on continually. About seventy men are employed.

DUTCH MINE, TUOLUMNE COUNTY, CAL.

During 1897 the mine produced in the neighborhood of $150,000, from which all outstanding debts were paid and $26,000 was paid in dividends, dividends having been paid almost regularly every month since last July. Considering the amount of money necessary to make a mine a dividend payer, the showing made by the Dutch mine is good and such showing is only possible when men of requisite experience are at the head of a company. The management started to sell stock at a figure calculated to bring the mine to a paying basis without the necessity of levying assessments. This has been accomplished so successfully that a large block of stock still remains in the treasury of the company, there being no necessity for its sale. G. Trittenbach is president. From the inception of the company A. Trittenbach has been its superintendent and manager, and the company considers much of its success due to him. B. Healey is vice-pres.; A. W. Livingston, treas.; G. W. Gerhard, sec'y.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—Dutch Mine, Tuolumne County, Cal.; Randsburg, Cal., March, 1898; Rand Mines and Buildings, Randsburg, Cal.; Garlock, Cal., Milling Point for Randsburg Ores; View of Rand Mines, Randsburg, Cal., 413. Walker Rotary Transformer; General Dimensions 8-900 50 Alternator, 420.

EDITORIAL.—A Typical California Gold Mine, 413. A Ruling of the Court; Rapid-Drop and Slow-Drop Stamps, 414. An Important Ruling; Miscellaneous, 414-15.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 422-23-24.

Electro-Chemical Treatment of Ores; The Extraction of Copper from Residues of Pyrites Burners; Population Always Increasing—Land Becoming More Valuable all the Time; "Vein" a Fracture in Rocks Carrying Ore, 417. The Dredging Engineer's Report; A Unique Mining Power, 418. Science's Newest Wonder, 418-19 Accumulation of Amalgam on Copper Plates; Most Available and Efficient Method of Public Lighting; "A Polyglot Community"; Change in Mining Methods; What They All Say; Shaft Sinking on the Witwatersrand; Demand for Men and Women Who Know To Do Things; Perfect Combustion, 419. Alternating Apparatus; How Coke Is Made, 420. The Trade School, 420-21. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Commercial Paragraphs; Fine Coal for Filtering, 421.

UTAH furnishes a good example of profit on low grade ore. In the Geyser-Marion at Mercur the average value of the ore is $3.75 per ton. A $6,000 dividend last week makes a total of $72,000 profit thus paid in the last year. The Mercur Company has paid dividends aggregating almost $1,000,000. At the Mercur mill the average cost of the treatment is 86 cents per ton; at the Geyser-Marion 82 cents.

THE annual report of the Nevada Co., California, narrow gauge railroad is a good showing of efficient management, and incidentally a good argument for what this paper has so long advocated, namely, the mutual profit to foothill and mountain regions of narrow gauge roads. There has been enough money lost to mining interests in the two counties of Amador and Calaveras alone to pay for the construction and maintenance for fifty years of such a road as that running from Colfax to Grass Valley and Nevada City. The little road mentioned, for the year earned $108,592; to operate it cost $85,623.

AT this week's meeting of the Regents of the University of California, the necessity being shown for the expenditure of $12,500 for the erection and equipment of a Mines and Mining Building, Mrs. Phœbe Hearst, one of the regents, made proffer of the amount, which was gratefully accepted. She also made the munificent offer of sufficient amount to secure the building of a larger permanent structure, the $12,500 being but for a temporary building and equipment. It is understood that that liberal lady's gift contemplates the expenditure of $250,000 for the mining department of the University.

DROUGHT on the land and low water in the streams makes this an ideal season in California for river improvement work, but beyond drawing salaries the State officials who have charge of the long deferred dredger proposition seem unable to make any headway. It is the old story of successful effort in and out of the Legislature to secure the needed appropriation, the co-operation of the Federal Congress and the securing of sufficient money to go ahead; and the now long drawn crossfire of opinions, hypotheses, etc., resulting in easy positions at comfortable salaries, but nothing more, and miner and farmer alike chafing at the prevailing impotence. The most recent official report on this subject appears on page 418.

A Ruling of the Court.

Notice was taken herein at the time of the decision of Judge Virden of Mono Co., Cal., against the recent state mining law abrogating mining district recorders. In the issue of the 26th ult. appeared an authoritative answer to the question: "If a miner locates a mine under the mining law of May 26, 1897, and does not do the required $50 worth of assessment work in sixty days, does he forfeit his claim, and is it then open for relocation?" During the week an eminent legal authority of Los Angeles cites the fact that Olin Wellborn, sitting as Circuit Judge in the United States Court at Los Angeles, last week rendered an important opinion, on a cognate subject, in the suit of Northmore vs. Simmons, involving the validity of a mining rule or regulation of the Mojave mining district, which required locators of mining claims to sink a shaft or run a tunnel ten feet within ninety days after the location of claims. It seems that Northmore made a location called the Vivian, but failed to do any work within ninety days, as required by the local rules and regulations of the district. A re-location of the same ground was thereafter made by the defendant Simmons, on the theory that the Northmore location had lapsed and become void by his failure to do the required work. Northmore filed suit in the U. S. Court, claiming that such a local rule or regulation was in conflict with the Federal Statutes, which only required $100 worth of annual assessment work. Judge Wellborn decided against Northmore, and ordered his bill of complaint dismissed. It will be noticed that the local regulation of the Mojave mining district required work to be done *after* location, etc., and such work was no part of the act of location itself. The State law referred to above requires $50 worth of work to be done upon each location within sixty days of the preliminary notice, thus making this work a part of the location itself.

From the foregoing it would appear that Judge Wellborn does not agree with Attorney-General Fitzgerald and a number of mining attorneys, who claim that a State law or a local regulation is void which requires any work to be done upon mining claims other than that demanded in the Federal Statutes. Judge Wellborn is considered an able lawyer; he was for a number of years Congressman from the Dallas, Texas, District, and has been personally interested, more or less, in mines during his ten years' residence in California.

The plaintiff has given notice of appeal to the United States Circuit Court of Appeals.

Rapid-Drop and Slow-Drop Stamps.

In connection with some recent discussion regarding the respective merits of slow-drop and rapid-drop stamp mills in California and Colorado, it is interesting to note that in the latter State the rapid-drop stamps are superseding the slow-drop method. In the Black Hawk district, Colo., where fifteen months ago there were but 25 rapid-drop stamps out of a total of 748, there are now 150 rapid-drop, and in such concerns as the New York mill the 75 slow-drop stamps are now being altered to rapid-drop, thus doubling the capacity. The slow-drop stamp of Gilpin Co. weighs about 525 pounds and drops 19 inches in a low mortar with deep issue, 30 to 40 to the minute. With this mill the plates used are 4½x8 feet. In California the weight of the already heavy rapid-drop stamp has been increased to 1200 and even 1400 pounds, dropping 90 to the minute. What is locally known as "the Colorado method" is giving way to existing conditions and requirements, which call for quicker work and closer saving. Advocates of the old style slow-drop, however, still maintain that Colorado ores give better results with slower motion; that the material must have time to settle or it will either scour off the plates or not come in contact. The obvious answer is that by giving the plates the proper inclination the tendency to scour is largely overcome.

The difference between the California and Colorado ores must be recognized. California gold ore is, generally, harder than that of Colorado, the gold is coarser, and as a rule the ore bodies are larger. In California ore there is, usually, a much smaller proportion of sulphurets than are in Colorado ore. Financial results, which are the standard and touchstone of all metallurgical methods, declare in favor of what in contradistinction has been styled "the California method," which in stamp practice means very heavy, quick-dropping stamps, the Colorado mill being here looked upon as an amalgamating machine.

An Important Ruling.

During the week the California Debris Commission has made an important ruling, or rather definition, regarding hydraulic mining in California. It will be remembered that at the last annual meeting in October, '97, of the California State Miners' Association, Section 8 of the Caminetti law was discussed at considerable length. That section is: "That for the purposes of this act hydraulic mining and mining by the hydraulic process are hereby declared to have the meaning and application given to said terms in said State."

Section 1425 of the Civil Code of California, approved March 24, '93, defining the term "hydraulic mining," says: "Hydraulic mining, within the meaning of this term, is mining by means of the application of water under pressure through a nozzle against a natural bank." This is the definition of hydraulic mining as understood by hydraulic miners in this State. The question came up in the convention and brought into prominence just what was understood to be the definition of hydraulic mining, the point being, Could one throw down a natural bank by explosives and then wash it, or could tailings be so washed? the question raised being the jurisdiction of the Debris Commission.

Under date of the 4th inst., in a communication to J. M. Wright of this city, Lieut. Deakyne, Corps of Engineers, Secretary California Debris Commission, says: "Hydraulic mining is defined by the California Debris Commission to be mining by means of water under pressure through a nozzle."

This is the latest official utterance of the Commission and is important to the hydraulic miners of California. It will be noticed that the matter of "a natural bank" is entirely ignored. The Debris Commission is the judge and interpreter of the law. This announcement covers the question discussed at such length last October.

As to drift mining, under this construction, Can a drift miner work his gravel, depositing it on the dump, and wash out that artificial bank "by water under pressure through a nozzle?" So far as this is concerned, is drift mining recognized by the Commission as hydraulic mining, and is the drift miner subject therefore to be enjoined and required to build dams, etc.?

In the judgment of the framers of the Caminetti act, and of those who secured a definition of what hydraulic mining is in Section 1425 of the Civil Code of California, referred to above, it is not hydraulic mining when water under pressure through a nozzle is operated against a bank of earth or gravel artificially placed. When this matter was being discussed last October, T. L. Ford said:

The operation of hydraulic mining does not consist alone of the propulsion of water against a bank artificially placed; aids are called to the assistance of the water, powder is used, blasting material, explosives, streams of water pouring over the banks, are also used. These agencies are used with the water under pressure; but the thing against which you operate is the gravel or earth as it stands where nature put it; and if you disintegrate it by means of explosives, if you break it down by means of water pouring over it, and then collect the gravel or earth thus obtained in sluices by means of water operated under pressure, you are conducting the business of hydraulic mining; but if you take gravel or earth that has been artificially collected in some place remote from its original locus, if you take the tailings of a mine that have been collected miles away from the place where nature first put them, and if upon these you turn water under pressure, you are not mining by the hydraulic process; you are doing something else—you are working tailings. No more can that be considered hydraulic mining than can the reduction of earth or gravel, taken from a drift mine and collected artificially in one place.

Hydraulic mining had its origin in California. Whatever just definition there is to the term "hydraulic mining" has developed and grown in this State, and all California miners know what is meant by the term "hydraulic mining." Their definition is believed to be incorporated in Section 1425 of the Civil Code of California. The Debris Commission is composed of impartial men who have desired

to make just interpretation of the matter submitted to them by the State Convention last October.

On this subject C. H. Lindley discourses at length in his new work, "Lindley on Mines." Under Section 852, Vol. II, he says:

All parties seem to agree that the application of water under pressure and through a nozzle were essential elements of definition of the terms "hydraulic mining" and "mining by the hydraulic process;" but it has been contended that unless the water is directed against a *natural* bank, one that is a part of the mass of the mountain in a state of nature, the application to it of water under pressure through a nozzle does not constitute hydraulic mining as understood in California. In other words, such application against a bank of material artificially constructed, such as a mine dump or deposit of tailings or loose gravel impounded or caved from its natural position by human agency, is not "hydraulic mining." The California Anti-Debris Association, representing the farming interests, contend that the term is, and always has been, sufficiently comprehensive to embrace the application of water under pressure through a nozzle to any kind of a bank or body of material, natural or artificial, where the object sought was to liberate and secure the gold. The lexicographers afford us but little aid in determining the local signification of phrases. The definition given in the Standard Dictionary is as follows:

HYDRAULIC MINING. A method of mining, in which a bank of gold-bearing earth or gravel is washed away by a powerful jet of water and carried into sluices, where the gold separates from the earth by its specific gravity.

Dr. Henry De Groot, a writer of prominence on subjects connected with California, in his contribution to the Britannica on the industrial history of that State says:

Hydraulic mining consists in the plan of breaking down and disintegrating the banks of auriferous gravel as they stand in place, by means of water discharged against the same in large quantity and under great pressure.

Lieut.-Col. G. H. Mendell, of the engineer corps, in his report made pursuant to the provisions of the river and harbor act of 1880, upon a project to protect the navigable rivers of California from the effects of hydraulic mining, gave the following definition:

Hydraulic mining, as it is understood in California, is that process by which a natural bank is excavated by a jet of water and conveyed by the same water through the sluices to the dumps. Water does all the work; manual labor is needless to a perfect bank. When boulders are found too large to pass through the sluice, they are sometimes blasted into smaller pieces. Where the bank is cemented or contains masses of pipe clay, it is shattered by charges of powder.

Hon. John S. Hittell, the most noted of writers on the subject of California history, thus describes the process:

Hydraulic mining is that mining where a stream of water, led down from a considerable elevation through a hose, is thrown by the pressure with great force upon the dirt which is thus loosened, dissolved, and washed down into the sluice. * * * Hydraulic mining is not a process of washing dirt, but of preparing it for washing.

Mr. Aug. J. Bowie Jr., a well known mining engineer, in his contribution to the American Institute of Mining Engineers, on the subject of hydraulic mining in California, says:

Hydraulic mining may be defined as the act of extracting gold from gold-bearing detritus, i. e., surface deposits, placers or washings by means of water under great pressure, through pipes against the auriferous material.

And, in his "Practical Treatise on Hydraulic Mining in California," he defines it as "that method of gold mining in which the ground is excavated by means of water discharged against it under pressure (hydraulicking)."

Dr. R. W. Raymond, in his "Glossary of Mining Terms," contributes the following:

Hydraulicking. (Pac.) Washing down a bank of earth or gravel by the use of pipes conveying water under high pressure."

Prof. J. Ross Browne, in his report to the Secretary of the Treasury upon the mineral resources of the West, tells us that the process was invented in 1852, and describes it as one "in which a stream of water was directed under heavy pressure against a bank or hillside containing placer gold, and the earth was torn down by the fluid and carried into the sluice to be washed."

When we search for judicial definitions we are practically limited to the debris cases.

Judge Sawyer, in Woodruff v. North Bloomfield G. M. Co., gives the following:

Hydraulic mining, as used in this opinion, is the process by which a bank of gold-bearing earth and rock is excavated by a jet of water, discharged through a converging nozzle of a pipe, under great pressure, the earth and debris being carried away by the same water through sluices and discharged on lower levels into the natural streams and water courses below. Where the gravel or other material of the bank is cemented, or where the bank is composed of masses of pipe clay, it is shattered by blasting with powder, sometimes from fifteen to twenty tons of powder being used to break up a bank.

In the case of United States v. North Bloomfield Gravel Mining Co., involving the constitutionality of the congressional act, the Government alleged that:

Hydraulic mining as now, and for twenty years last past, practiced and understood in the State of California, is a process of gold mining by which the hills, ridges, banks and other forms of deposits of earth which contain gold, are mined and removed from their position by means of large streams of water, which, by great pressure, are forced through pipes terminating in nozzles kown as "monitors" or "little giants"; that the water is discharged from such nozzles with great force, by a water pressure of from 50 to 400 feet per second, against and upon the hills, ridges and banks, and other deposits, which are usually shattered or broken up by means of blasts of powder, and softened by running water over and along such broken banks of earth, and undermined by streams of water flowing at the foot of such banks, thus caving down and washing off portions thereof before water is discharged from the nozzles against them.

Judge Ross expressed the opinion that this allegation sufficiently set forth the meaning of the terms "hydraulic mining" and "mining by hydraulic process" as these terms were used in the congressional law.

There can be no question but that in all of the debris cases the process under consideration involved to some degree the use of artificial methods to loosen the soil, such as blasting, undermining with a stream of water and causing natural banks to cave, before the water under pressure was applied. It was a part of the process and a material aid to rapid and efficient work. It cannot plausibly be maintained that when the "little giants" and "monitors" were directed against the mass of material thus torn from the hill by blasting or caving, the miner was not engaged in "hydraulicking," and yet his efforts were not immediately directed against a *natural* bank.

The use of the term "natural bank" in the definitions given must be considered in connection with the context. We think the fair deduction from all the definitions is this: The essential feature which distinguishes hydraulic mining from other classes of mining is the substitution of the power of water, under pressure, applied through a nozzle, for manual labor, in moving material into the sluices, whence, if not impounded, it is carried into the running streams. Whether this application is made against a bank in its perfectly natural state, or against one artificially created is, in our judgment, immaterial.

If a miner turns his monitor against a mass of impounded earth, rocks and tailings, brought down by the streams from a higher operator, would anyone familiar with "mining by hydraulic process" say that he was not "hydraulicing?" If he was not "hydraulicing" how would his method of operating be characterized in the mining vernacular?

Whether or not a miner conducting mining operations within the district defined by the congressional act is within the purview of the act, and subject to the jurisdiction of the commission, will depend not upon the fact that he is or is not contributing to injuries to the navigable streams, but the inquiry is simply, "Is he utilizing water under pressure, through a nozzle, directed against a bank or mass of earth for the purpose of extracting gold therefrom?" Whether the bank or mass was brought to its present abiding place by the carrying power of water during remote geological ages, or is the result of recent utilization of such carrying power by human agency operating on a higher level is, in our judgment, of no legal significance. It is fair to assume that the feature of the great industry of hydraulic mining in California rests in a liberal administration and interpretation of the existing law, or some law framed upon the same general lines. Insistence upon narrow rules of interpretation, which do violence to the spirit of the law, will impede rather than advance the interests of the industry.

THE recent proffer of the Union Iron Works of San Francisco to the Government to erect and maintain a gun factory here is in line with manifest requirements, and practically would give the United States all the facilities of a government factory without the cost of creating or keeping it up. The Union Iron Works has finely demonstrated what can be done in the way of building battleships here. It is a shame, that in the present crisis, the nation has to expend so considerable a proportion of the $50,000,000 appropriated in buying fighting ships abroad. There are idle men enough on this coast to build ships fit as foreign vessels for national defence. Two ships recently bought in England cost $7,000,000. The principal element of cost in such fighting machines is labor. That $7,000,000 would have employed 9000 men for one year at $2.50 per day, and the money would be circulated here instead of sent solidly away. With proper encouragement, that is, definite assurance of work at going prices, battleships built here in San Francisco could be equipped fully armored and fully armed, the complete whole a local product and a creditable one.

IN the issue of the 2nd inst., in answer to a Lillooet, B. C., correspondent who asked at what rate per ton gold is absorbed by new copper plates, recent experiments at the Simmer & Jack, South Africa, mine were referred to. A mistake was made in giving as the result of such experiment a probable absorption of "half an ounce" to the ton of ore milled. It should have read half a pennyweight.

Profitable Deep Mining in California.

Deep mining on the California gold belt makes a satisfactory showing, encouraging in the fact that values increase as depth is attained. In Calaveras county the Gwin mine, now down 1500 feet, only low-grade ore was encountered for the first 400 feet; but between the 400 and 900-foot level $10 ore was produced. Over $2,000,000 was paid in dividends when work was abandoned on the mine by reason of extensive caves many years ago, and since its reopening, at an expense of a quarter of a million dollars, it is again a famous producer. The Kennedy mine, now the deepest in the State, 2400 feet, in Jackson, Amador county, was sunk and worked to a depth of 600 feet of low-grade ore and then shut down, because at that time appliances could not be found to make ore of that grade pay. Upon being reopened ore was found on the 900-foot level that averaged $15 per ton. Since its reopening it has paid over $2,000,000 in dividends and is valued to-day up in the millions. In the same county with the Kennedy may be mentioned the Keystone, 1400 feet; the Mahoney, 1000 feet; the Eureka, 1200 feet; the Wildman, 1400 feet; the Zeila, 1100 feet. In Calaveras county, beside the Gwin, may be mentioned the Utica, world famous as a gold producer and great dividend payer, down over 1300 feet; the Melones, 1000; the Lane & Tulloch, 1350. In Nevada county the Providence, 1700; Omaha, 1700; North Star, 2100; the Idaho-Maryland, 3100 (on the incline); the Empire, 2400; the Champion, 2100. These mines have records of millions, and still, as stated, are productive of greater values at greater depth, indicative of what pushing to deeper levels will attain.

In this regard it is worthy of note as to the difference of opinion among mining men, whether pay rock may be expected before depth is attained. It is held by some that unless at a depth where surface influences cease gold is found in paying quantities, it is not of much use to expect good ore at greater depth, though results do not carry out this argument. Every pay ledge has barren places in it. Rarely, if ever, is gold found distributed evenly through a quartz vein, and it is not reasonable to assume that only ore carrying gold in paying quantities is to be found in the outcroppings. In the natural forces which created the mountains, it is reasonable to assume that both pay ore and barren quartz were alike upheaved; and because the outcroppings are rich it does not follow that a rich mine exists underneath, nor where the outcroppings are light does it follow that paying ore may not be found underneath. In the first history of the Kennedy, the Eureka, the Keystone and several large gold producers of this State, good ore was found near the surface, and better still below. The argument throughout is that it pays to sink deep on "the mother lode." Take one more case, that of the Eureka, Sutter Creek, Amador county, Cal.: the first 400 feet gave $2 50 per ton; subsequently, as depth was attained, that great property gave an output of over $15,000,000.

A Case in Point.

The following letter is a private one received this week, not intended for publication, but is printed here as a sample of similar letters constantly being received at this office. It sometimes happens in cases of this kind that the miner is placed in communication with men having money and judgment enough to take hold of such a thing as a good business proposition:

————, Cal., April 12th, '98.

* * * * * You always seem so willing to help the miners, that I turn to you before any one else. I want money to help develop a good mine. There has been about $10,000 expended on this property and a stamp mill erected. We have stamped out about $1000 in gold, but will have to run a tunnel about 500 feet before we can get ore and water out and work it to advantage. We now have to sack all the ore, draw it up an incline by hand, car it to a chute, shoot it down to another car, and car to wagon. I do not think there is a better proposition in California. The ore assays from $10 to $150 per ton.

The above letter is printed as an illustration of what this paper constantly maintains: that there is more likelihood of profit in taking up such a proposition as the above than in 99 out of 100 Alaska or Klondike or other far-off hazards. There are a good many California miners in precisely the same situation as the writer of the above letter—men who have put all the money they could get hold of into honest and intelligent development work, and who want some more to make a good mine. Such men, coupled with others furnishing the needed capital, make a strong combination. Meanwhile the man who is situated as is the writer of the above letter has the strength of the game; he is bound to win, and can get along without the capitalist—slowly, 'tis true, but is independent. 'Twould be better if such a man could get requisite capital, for operations could be conducted on a larger and more profitable scale, machinery bought, more money produced and spent, with more resultant profit. The letter is typical of a state of affairs in California mining that can only be bettered or solved by a full realization of the profit of investment in such local mining properties.

Randsburg, Cal., Mines.*

The ores of the Randsburg district are generally siliceous. The vein matter is an oxidized quartz, a small percentage of sulphurets. As depth is attained on the various properties, there are indications of the ores becoming more refractory. The depth of the various workings ranges from 125 to 400 feet, and it is estimated that the water level may not be reached inside of 1000 feet, and it is not likely that the free-milling character of the ore will materially change above that level. The speculative and town-building period has passed, and the business of the district is becoming one of mine development and ore production.

The properties of the district have received very little outside financial help, and it may be generally stated that they have paid their own way, so far as developments and improvements are concerned. As a consequence, progress has been slow, but the showing made, so far as development goes, has been encouraging.

The water supply for the town and the mines is hauled several miles in wagons, though a pipe-line is being put in to convey it, which is completed as far as Johannesburg, two miles from Randsburg. The principal milling facilities are at Garlock, twelve miles northwesterly from Randsburg, where an abundance of water is obtained from wells. There is a 10-stamp mill at Johannesburg and one of two stamps at Randsburg, both in operation. The two mentioned are run by gasoline engines. At Garlock there are four 10-stamp mills, one of two stamps and one Huntington. Three of these 10-stamp mills are operated by steam, brush from the desert being hauled in, like huge loads of hay, for fuel. As an indication of what the three principal mills are doing, it may be stated that within fifteen days in March they milled 650 tons of ore, cleaning up therefrom an average of $33 per ton. Besides, a small cyanide plant is operating at Garlock on mill tailings, by which a saving of from $5 to $8 per ton is made.

The Rand group, at Randsburg, now owned by the Yellow Aster Mining Company, is developed by three vertical shafts, four tunnels and about 3000 feet of drifting. One tunnel, which crosscuts the formation, cuts through seven distinct ledges of ore with 200 feet. A system of tunnels, one above the other, will be connected. A deeper shaft is to be sunk on the lower portion of the property, from which drifts on the veins will be made at much greater depth than the present workings. The deepest shaft at present is about 200 feet, but the bulk of the ore has come from the system of tunnels which cut into the side of the mountain above the shafts. This property milled 1620 tons of ore in February, from which the mint receipts showed a return of $35,234. For the first eighteen days of March the same property milled 800 tons, realizing therefrom $26,320. The February output averaged $23 per ton, and the output for the first eighteen days of March, which came from deeper workings, averaged $33 per ton. The company estimates that not to exceed $5 per ton of values are left in the mill tailings. However, the building of a cyanide plant is contemplated, to work the tailings of this ore. In this property the vein walls are not always distinct, much of the gangue rock appearing to be mineralized to some extent, as well as the high grade pay streak. In all the specimens noticed, which panned out readily, it is observed that the free gold is very coarse. The Rand group has produced $135,000 since Dec. 1, 1897, and about $200,000 all told. An unusual thing about this property is that it is being developed into a big mine by the original locators of the claims.

The Napoleon mine, in the Stringer district, about two miles from Randsburg, is being developed from six different shafts, varying in depth from 75 to 160 feet. Incidental to development, about twenty-five tons of ore per month is being milled. The shafts all go down on veins. A singular thing here is that the numerous leads, or stringers, all cut the formation at right angles, instead of following it longitudinally. Within 300 or 400 feet as many as fifty "stringers" of ore have been found. Conditions in this property are duplicated in nearly all the others. The Eureka mill ran twenty-three and a half tons of Napoleon ore which yielded $3500. Tailings from this mill cyanided only $2.20 per ton; hence it is assumed the mill saving was very close and the gold in the ore very free.

The Merced mine, in the Stringer district, has three or four claims, on one of which is a shaft 160 feet deep, with some drifting. J. W. Scott, manager, states that 382 tons of ore have been milled the past year and that bullion of the value of $14,532 resulted.

Adjoining the Merced is the Winnie, whose shaft is 150 feet deep. It belongs to Chas. Cohen, owner of the Kane Springs stamp mill, and is said to have produced about $25,000 in all.

The G. B. mine, nearer town, is owned by McCormick, Powers & McComb. They are developing from a shaft 200 feet deep, and have 500 feet of drifting. I am informed that 1000 tons of ore have been shipped which ran from $20 to $30 per ton. In this property there are stringers of sulphide ores which are better adapted to concentration.

The Little Butte group, located on the outskirts of Randsburg, is equipped with a gasoline hoist, over a 400-foot incline shaft, from which 300 feet of drifts are run. It is stated that the ore from this property has run from $50 to $75 per ton. The values run in comparatively narrow pay streaks.

The Wedge, which joins the Little Butte and Kinyon, has five levels from a 400-foot shaft, which goes down on the vein, on which there is some local faulting. The rich ore is in the pay streak near hanging wall. Ninety tons of Wedge ore averaged $140 per ton. In this vein the pay ore is as narrow as 2 inches and widens out in places to 2 feet. The Wedge and Little Butte mill their ore at the Johannesburg mill.

The Kinyon shaft is 260 feet deep and drifts therefrom extend 175 feet. The management say they ship 220 sacks of ore per month.

The mill belonging to the Johannesburg Reduction Works has ten stamps, treats twenty-five tons per day and uses a gasoline engine.

The Rand-Kern Company contemplate putting in an electric power plant on the Kern river, thirty-six miles west of Randsburg, and transmit power to the district for the use of the mines and mills, a majority of the owners having agreed to utilize a certain amount of power. This enterprise is being promoted by J. W. Eddy of Los Angeles.

At present thirteen gasoline engines are in use in the Randsburg district. It is readily seen that they are well adapted to use in the desert mines, where fuel and water are not easily nor cheaply obtained, and, as operators become more accustomed to them, some of the annoyances incident to running them will disappear.

A milling, concentration and cyanide plant is to be built at Barstow, with special reference to adaptability to the ores at Randsburg, Radamacher and Panamint country. The projectors of this enterprise are those who own and operate the Randsburg railroad between Kramer and Johannesburg, and their plan is to become ore buyers and create a market for any ores running as high as $8 per ton.

In the Mesquite range, at the foot of which Garlock is situated, there are several partially developed properties, whose ores are refractory but well suited to concentration. The reduction plant proposed for Barstow should greatly aid in this development.

Mineral paint, said to exist in extensive veins near Johannesburg, has been used in painting several buildings there. C. H. Stagg is developing this enterprise.

WASCOTT.

Randsburg, Cal., April 4th, '98.

*See illustrations, page 413.

THE practical prospector is rapidly taking the place of the ignorant and the inexperienced. He has paid for his knowledge, not by years in the management of paying properties, but by years of loss mixed up with his gains, to indelibly impress his experience upon the mental faculties. It is a business to which few are adapted, and fewer still are successful. There is nothing in the business world that requires such a wide range of knowledge as that of mining and prospecting. The practical prospector of to-day understands every detail of the solfataric, dynamic and chemical factors most effective in the world's past periods of universal formation. He has learned that while heat, water and vapors have produced deposits in veins and otherwise, many of which have proven valuable, that the greater part of the great bonanzas of the world are always in connection with two of the six principal divisions of igneous or eruptive rocks—trachyte and felsyte—the former generally lying in great fields and truncated masses, the latter in dikes and in overflows and older formations. These again have been divided into various characteristics, owing to the period of eruption or subsequent metamorphism, all of which have been instrumental in mineralizing the adjoining country rocks in veins and deposits. The secrets of the success of the modern prospector and mine manager lie in his knowledge of the dates and effects of the porphyry overflows and intrusions. The advance from prehistoric mining was slow, but is now coeval with all other industries and scientific attainments.

SINCE 1873 Missouri's zinc mines have produced ore which sold for $33,500,000, and during the same time the lead mined brought $17,000,000, a total of $50,500,000. The expansion of the business may be judged from the fact the output this year is estimated at 230,395,192 pounds of zinc and 35,650,940 pounds of lead, giving a total value of $3,181,464. Zinc enters into manufactures, such as roofing, galvanized iron, water tanks, plates for engraving and many articles of art. The British zinc mines yield less than one-sixth of the present zinc output of Missouri, and the gap is constantly widening in our favor. England is compelled to import 75,000 tons of zinc annually to meet the factory demand. Scarcely a year passes in which some new application of the metal is not devised. On April 2 at Joplin, Mo., zinc ore sold at $26.50 per ton, an advance of $5.50 per ton in one year.

"GOLD DUST, How to Find It and How to Mine It," is the title of a pamphlet issued by P. Minor, Seattle, Wash., which costs but 25 cents, and has practical pointers on prospecting and mining.

Treatment of Slimes.

NUMBER II.

The Solution of the Gold.—The dissolving of the gold in fresh slimes is a comparatively simple matter in comparison with the dissolving of the gold in accumulated slimes. In fresh slimes there are usually very few reducing or oxygen-consuming compounds, while in accumulated slimes we may have various substances which will absorb oxygen; and, if we wish the cyanide gold-dissolving solution to act, oxygen must be present. In old slimes, decomposing organic matter, arising from different sources, as well as the various products of the decomposition of pyrites, are always present; all these substances have in common the property of absorbing oxygen in a more or less degree. Therefore, during the operation of dissolving the gold in old slimes, oxygen must constantly be supplied. In the solution of the gold in fresh slimes, also, more perfect and rapid results are obtained when a constant supply of oxygen is secured. At the Robinson works we put the fresh slimes into agitating vats, 20 feet in diameter, filled with paddles, revolving about eight or ten times a minute. The agitation of the slimes by means of stirrers and fixed wings attached to the sides of the vats produced an ever-changing surface which absorbed oxygen from the atmosphere, and after six to twelve hours of such agitation, a fairly perfect solution of the gold in the fresh slimes was obtained. But this same operation, applied to accumulated slimes, did not dissolve the gold, and, in fact, a very lengthened agitation of forty-eight hours failed to do so. In an experimental way, dealing with a few pounds of accumulated slimes, but little difficulty was experienced in dissolving the gold by agitation, because, where you have a comparatively small amount of material to deal with, there is a relatively large surface exposed during the treatment. Whether the agitation is done in a bottle (which is opened from time to time) or in a small vat, the surface exposed for the absorption of oxygen is relatively large, and, as a rule, when working in a small way, the difficulties of dissolving gold from accumulated slimes without the addition of oxygen, other than that obtained from surface aeration, are not experienced. One important point in the solution of the gold was not really understood until we had been working on a large scale for a long time, that is, the concentration of the slime in the liquid, or in other words, the thickness of the pulp. A ton of liquor which is agitated with half a ton of slimes forms a very smooth, viscous pulp, in which, if you suspend a can of cyanide (which dissolves readily in water) the lumps of cyanide remain for several hours undissolved. In other words, the thick pulp will not readily dissolve even so soluble a substance as cyanide; while if you thin the pulp to four or five tons of liquid to one ton of slimes, soluble substances will dissolve very rapidly. In the same way oxygen is absorbed from the atmosphere much more readily by dilute pulp than by thick pulp, and we have found in actual practice that the gold in a thin pulp dissolves more readily than in thick. The general practice is to have about four tons of liquid to one ton of slimes for dissolving purposes, and beyond this point the thicker the pulp the longer the time for the complete solution of the gold.

The principle of oxidation of the reducing substances in slimes by means of aeration was put into practical use by W. A. Caldecott, who, in a paper read before you, has given the reasons that render this operation specially necessary in the treatment of accumulated or acid slimes. This operation was first carried out at the Robinson slimes plant by the introduction of atmospheric air through a perforated pipe in the bottom of the vat containing the charge of pulp undergoing agitation. After preliminary oxidation of the pulp had taken place, in order to lessen cyanide consumption, cyanide was added and aeration continued. It was found that the gold dissolved as readily by this method as in the case of fresh slimes.

The method adopted by Mr. Williams at the Crown Reef for dissolving the gold in fresh slimes was to transfer the pulp from one vat to another by means of a centrifugal pump. In the passage of the pulp through the pump and pipe more or less air is drawn in through pump and pipe joints and glands, and a certain amount of oxygen is absorbed by the pulp whilst the same is undergoing the most perfect agitation, i. e., in its passage through the centrifugal pump and afterwards through the pipes; when the stream from the outlet of the pipe falls upon the surface of the pulp remaining in the vat, a large amount of air is likewise entangled and carried below the surface by the falling stream, thus causing a very perfect aeration to take place. I must confess that I did not until very lately appreciate the efficiency of this operation for dissolving gold. The pulp is simply pumped from one tank to another through a centrifugal pump. Now, at first sight, this appears a simple operation, and, unless one fully realizes the actual condition under which it is carried out, and the chemical reactions involved in dissolving the gold in the pulp, one cannot appreciate its full significance. It was only after the aeration of the slime-pulp at the Robinson and Central works had been carried on for some time that I fully under-

stood and appreciated the operation. Mr. Durant suggested that possibly sufficient air could be introduced into the suction of a centrifugal pump by a proper regulating system of valves for the air and pulp, so that aeration, not only of fresh slimes, but also of accumulated slimes, could be carried out. Although aware of the very low efficiency we were obtaining, owing to shallow vats and other reasons, from the enormous amount of air delivered from air-compressors, I still doubted whether proper aeration could be carried out through the agency of a centrifugal pump. However, a series of experiments in connection with the introduction of air in the suction of the centrifugal pump were undertaken, and these experiments have, I am happy to say, resulted in complete success. We have now by this means been enabled to considerably reduce the time required to obtain solution of the gold, and we have also secured a reduction in the amount of power that is required for the operation. I hope that Mr. Durant will, in the near future, present you with a paper on this subject.

At present there are in operation upon these fields three methods for the dissolving of gold. One, carried out by Mr. Williams at the Crown Reef, consists of pumping the fresh slimes from one tank to another through a centrifugal pump; the second method is used at the Geldenhuis Estate, where the fresh slimes are simply agitated in a dissolving vat, by means of stirring gear, for six or eight hours; the third method, which is carried out at the Simmer and Jack, the Treasury, and the Main Reef, consists in a joint use of both the former methods—that is to say, agitation and pumping through a centrifugal pump. At the Bonanza, agitation, aeration with an air compressor through a pipe placed near the bottom of the vat, and circulation through a centrifugal pump, are all in use at the same time. At the various deep level plants erected by Mr. Williams agitators are used (in several cases) on half the plant only, and on the other half pumping from one vat to another only is employed. In these cases, as at the Main Reef, both systems are being tried at the same works to ascertain which is the more economical. At our Central plant we have adopted agitation and pumping by means of Mr. Durant's agitation process or suction through the centrifugal pump. This is working on accumulated slimes and giving very satisfactory results. At the Robinson plant we have also proposed the adoption of this method. My opinion is that in the future tanks with large diameter and of great depth will be utilized without agitators and the solution of the gold will be done by pumping from one tank to another through the centrifugal pump, similar to our method at the Central works. By this means less power will, I think, be needed, and, on the other hand, as perfect a solution of the gold will be obtained as by the use of agitators.

In a deep tank the particles of slime are a fairly long time in settling through the cyanide solution. Now, let us look at this point for a moment, and we find that we have practically the converse of the tailings treatment. In a tank where sand is being treated, the liquid moves down past each particle of sand, always keeping in motion, until it flows through the exit pipe to the precipitation boxes, the particles of sand remaining still. In a tank of say 20 feet in depth, where slimes are being treated, with a mixture of four tons of solution to one ton of slimes, the particles of slimes are gradually settling down through the cyanide solution for twenty-four hours. In other words, each particle itself has a certain amount of agitation or motion (induced by gravity) through the cyanide solution, covering a space of fully twenty-four hours before it finally finds a resting place. Now, if this pulp has been fairly well aerated before being delivered into the tank, we have a ready means of dissolving the gold in the slimes and a very cheap form of motion or agitation as well. The deeper the tank and the longer the time that is given for settlement, the closer together will the slime particles settle, and consequently the less will be the amount of moisture retained by the settled slimes. The particles will, by their own weight, gradually settle closer and closer, at the same time squeezing out the gold-bearing solution from between them; in the course of the operation you have upward filtration; so the deeper the tank, the longer the time the particle will be in settling through the dissolving medium, and the greater can be the depth of settled slimes that finally accumulate at the bottom of the tank; also less moisture or gold-bearing liquor will remain with the pulp. We can conclude, therefore, the deeper the tank is made, the fewer times will it be necessary to re-pump the slime pulp from one vat to another, and the less power will be required per ton of slimes treated.

(To be Continued.)

In the issue of the 2nd inst. appeared an article, "Electro-Chemical Treatment of Ores," from a recent paper by Gen. C. E. Webber, taken from *Industries and Iron*, London, England, and referring to an invention of a process, the patent rights of which are stated to be controlled in North America by the General Gold Extraction Co., Limited. Under date of the 7th inst, the Denver, Colo., agent of the company—Mr. Violette—writes that the vats and the process itself are covered by United States patents.

The Extraction of Copper from Residues of Pyrites Burners.

Written for the MINING AND SCIENTIFIC PRESS by R. HELMHACKER, Prague.

Since the native sulphur or brimstone is consumed only in small quantities in the manufacturing of sulphuric acid, other raw materials for generating sulphuric acid have been brought successfully in use during the last decades of years. The SO_2 is no more generated by burning brimstone, but by calcining sphalerite or zincblende ZnS or by roasting or burning of iron pyrites by improved procedures. The roasting of iron pyrites, if they are not of poor grade containing less than 30% of sulphur, is accomplished without the aid of fuel. When the SO_2 gas is evolved by the burning of pyrite FeS_2, there rest a residue consisting of iron sesquioxide Fe_2O_3 which might be advantageous as iron ore for the pig-iron melting works if the pyrite did not contain a slight quantity of admixtures, which were almost thrown aside by the factories as valueless, or they were partly used only as mineral paint. Most of the iron pyrites contain chalkopyrite, arsenopyrite, pyrhotite and other minerals, with copper and traces of silver or cobalt, zinc, lead, arsenic, bismuth and other metals, which, when burned, contain CuO, Cu_2O, Cu_2S or $CuSO_4$ and other combinations of elements, making the pyrites residue or Fe_2O_3 not valuable to be reduced immediately to pig iron. But a commercially successful process attacking the problem to recover the copper from the residue from the pyrites burning method permits to free the pyrites residue from the small amount of copper contained in them by a leaching process.

The most used process to extract the copper from the pyrites residue is the modified Hœpfner method, by which the cupriferous iron sesquioxide is first either chlorinated by calcining with common salt (NaCl) or leaching with salt, by which the copper subsulphuret is decomposed with copper chloride to copper chloride and sulphur slime. If calcium chloride is then added, the copper is more easily electrolyzed than if only common salt were the leaching ingredient. The formed silver chloride is also leached in the solution of natrium chloride, as it is soluble in a slight degree in it. This method had undergone many changes and is modified and complicated when the silver and cobalt salts are to be extracted, wherefore other ingredients as limestone and hydrochloric acid are also used, the first either to decompose sulphates or to precipitate chemical cobalt combinations from solutions, the last to dissolve some byproducts or flume slimes. The way is generally to receive a solution of copper (sulphate or chloride) in common salt and precipitating it with scrap iron to precipitated copper, which, containing silver, cobalt or other metals, is refined either on the dry way by smelting processes or again dissolved and electrolyzed in a solution to which calcium chloride is added. In prosecuting the leaching process, other precipitates, namely, the flume slimes, are obtained, which must be recovered by other processes. But in case the residues of pyrites contain silver, this metal is first precipitated in the solution by fine divided copper to a silver slime, and afterward the precipitation of the crude copper with scrap iron takes place. The precipitation of cobalt slimes, mostly with carbonate of lime, is done either before or after the copper precipitation. The precipitated copper can be again refined by the humid electrolytic process. When the chemical constitution of the solutions and precipitates is known, modified methods of treating the products and other chemical processes may be adapted by each one knowing the principles of the analytical chemistry to obtain satisfactory results.

The pig iron works at Vitkovice, near Moravian-Ostrow, in Moravia, Austria, applies such methods of leaching the burned pyrites residue in a plant erected in the year 1879. The residue from pyrites from burners from Austrian and foreign sulphuric acid factories are extracted, to recover the silver, copper and also the cobalt contained in them. All the pyrites residue—that is, the oxide of iron—treated in this establishment yield from 3.3 to 5.0 kg. Cu, and from 15⅞ to 25 gram. Ag, or an average in all the raw material extracted during the years 1880 to 1895, 4.0 kg. Cu, and 20 gr. Ag per ton, besides very small amounts of sulphur, zinc, lead, cobalt, etc. During the time from 1879 to 1895: 460,800 tons residues of pyrites, or in the yearly average 27,100 tons were treated. The capacity of the leaching plant is becoming always larger, for the bulk of extracted pyrites residue amounted to 13,350 tons in the year 1887, while, increasing at a rapid rate, it reached 51,750 tons in the year 1895.

The plant in the Vitkovice Copper Extracting and Electrolytic Works consists of four calcining furnaces, one heating furnace, one waste metal melting furnace, two mortar mills, many extracting vats and an electrolytic apparatus, the last working since the year 1886. To utilize the small amounts of metals contained in the residue of pyrites burners, the following materials are used to free one ton of them of the valuable admixtures: 90 kg. sodic chloride, common salt for chlorinating, calcination and extraction, ¾ kg. limestone (carbonate of lime), 9 kg. calcium-chloride, $\frac{3}{10}$ kg. hydrochloric acid, 2.6 kg. scrap iron (wrought iron and not cast iron) for precipitation of copper; further 9½ kg. coke, in case the precipitated copper is melted to crude copper, and 330 kg. mineral coal, slack coal and coal slimes from the wet coal dressing mill, for heating the furnaces and warming the solutions in the vats.

The output of the residue of pyrites utilized to the fullest extent is, from 1000 tons leached matter: 74 kg. silver slimes, yielding about 27½% fine silver, 6524 kg. precipitated copper and 867 kg. vats and flume precipitates, 160 kg. sulphur slimes and 317 kg. slimes having their value in cobaltic chemical combinations, which are further decomposed in chemical factories. The precipitated copper from the first processes before they were improved by the foregoing precipitation of silver and cobalt compounds, showed, dried at 100° C. in average samples, the composition, according to Schneider:

Cu = 11 30, Ag = .521, Au = trace, Cu_2O = 65.31, Bi_2O_3 = .19, Fe_2O_3 = 3 86, ZnO = 45, As_2O_3 = 1.18, P_2O_5 = .20, Cu_2Cl = .32, FeCl = .16, CoCl = .29, NiCl = .07, As_2Cl_3 = 1.32, $PbSO_4$ = 2.19, $NaSO_4$ = 3.39, $CaSo_4$ = 5.32, $MgSO_4$ = .59, Fl_2O = 2.98; total, 99.641.

The silver yielding (not yet desilverized) precipitated copper, melted in crucibles without any flux, but some charcoal dust, to crude copper, showed the composition, by an alalysis made by Schneider, as follows: Cu = 92.752, Ag = .699, Au = .001, As = 1.452, Bi = .188, Pb = .760, Fe = 3.10, Co = .178, Ni = .051, Zn = trace, P = .055, S = .190, O = .360; total, 99.797.

At present the solution is first desilverized by precipitating the silver with fine divided copper. The copper is precipitated by means of iron, and is, therefore, when melted to crude copper, while containing any silver, not to be desilverized on the dry way in smelting works.

The sluice slimes from the copper leaching show, dried at 100° C., tested in average samples, the composition, according to Privoznik: $Ca\,So_4$=47.357, $Mg\,SO_4$=3.351, $Na\,SO_4$=17.136, $Pb\,SO_4$=6.349, NaIl=4.273, Ag Cl=1.010, Cu Cl=3.220, Zn Cl=1.519, Fe Cl=.803, Au=trace, As_2O_3=.223, Fe_2O_3=5.564, Nl_2O_3=.595, P_2O_5=.328, SiO_2=1.980, Fl_2O and loss 6.292; total, 100.000. The slimes are yet valuable for the extraction of Cu and Ag in solving them and precipitating these metals.

As the analyses show, the precipitated copper contains some cobalt compositions which are utilized by precipitating them with CaO or $Ca\,CO_3$, or other reagents, either from the solutions before the copper is precipitated, or after this is done, according to the chemical methods chosen for the elimination of the salable substances contained in the residue of pyrites. The obtained precipitated copper and the copper in the flume slimes is refined since the year 1886 in an electrolytic plant, giving from 1000 tons treated residues an output of 3646 kg. electrolytic refined copper, either in the shape of cathode sheets or as common galvanic copper and refuse copper. At once blue copperas or copper sulphate is extracted, the average output from 1000 tons leached residues amounting to 1180 kg.

The iron oxide forming the residues, from which the above named substances were eliminated, is now valuable for pig-iron melting; and being mixed with other iron ores, is valued at 7 florins per ton. The silver in the silver slimes, which yield about 27½% of it, is falling off in the price. Seven years ago it was sold at 21⅜ to 20 florins per kg., while in 1895 only 13⅔ florins were available. The copper shows also, when compared with the prices nine and five years ago, which were 810 and 630 florins per ton, a slight decline three and two years ago to 704 and 768 florins; but in 1895 it was only salable at 500 florins per ton. The copper sulphate being steady on the standard price of 200 to 180 florins per ton, it fell in the year 1895 to 150 florins.

POPULATION is always on the increase. Land is not. Therefore land is becoming more valuable all the time. Real land values never depreciate. When they seem to do so it is because fictitious values have been placed upon them, or because of the increased purchasing power of money—always on account of some extraneous but relative condition or circumstance. It is a fact, too, plainly apparent and irrefragable, that intelligent application of productive industry to land is sure of adequate reward. Investment of money capital or the better capital composed of brains and muscle, is always safe and desirable. It is especially so at this time when the purchasing power of money is relatively at its maximum.

T. A. RICKARD says: "A 'vein' is a fracture in the rocks carrying ore; when such a fracture cuts across the bedding planes of the country it is styled a 'true fissure vein;' when the fissure vein is not inclosed by a single rock formation, but has one wall of one kind and the other wall of another kind of rock, then it is a 'contact fissure vein.'"

THE Gaston Ridge mine, formerly known as the California, at Graniteville, Nevada Co., Cal., which was bonded from C. D. Lane for $50,000 to Hutchinson & McCutcheon of San Francisco and Peaslee & Smith of New York City, has been bought for that amount by the latter named. The purchasers will put up a 20-stamp mill.

The Dredging Engineers' Report.

In Sacramento, Cal., on the 9th inst., at a meeting of the Board of Public Works, the following report on dredgers was submitted:

Department Public Works, Sacramento, Cal.—GENTLEMEN: Complying with your inquiry of Jan. 20th, '98, concerning dredging machines, asking at what points on the Sacramento and San Joaquin rivers, if any, a hydraulic dredger could be used to advantage; what make of dredger we would recommend as the best; its cost, capacity and cost to operate; what disposition we would recommend to make of the material taken out of the rivers, and whether or not the work that could be done with a dredger would justify the expenditure for purchase of such a machine, we have the honor to submit the following report:

By a hydraulic dredger we mean a machine which generally by suction, aided by other mechanical devices, removes material from the bed of a river, and by the aid of water conveys through pipes such material ashore or deposits it in other places in the bed of the stream. All machines of this character are protected by various patents, and their unauthorized use might lead to vexatious litigation. Some hydraulic dredgers use buckets or conveyors for hoisting the excavated material into a pipe or hopper, and then by the application of pumps force the spoil ashore.

For economical purposes hydraulic dredgers use centrifugal pumps either for lifting the material or for forcing it ashore, generally for both purposes. Where the material to be removed has to be deposited on a bank or levee exceeding about 15 feet in height above the surface of the water, the expense of handling is greatly increased, and for this reason for the purposes of levee building they are not considered as economical machines.

For purposes of rapidly cutting a channel through or over a bar, provided the material can be redeposited in the river or on a low bank, even though the place of deposit be several thousand feet distant, a hydraulic dredger is eminently the economical one to use.

On material such as is found in the San Joaquin river, where cut-offs have heretofore been made, such machines have not been tried, though the opportunity has been given and machines were available. The work was open to competition, but the hydraulic machines failed to get the award, either because their owners failed to bid or because the owners of other types of machines underbid them.

For ordinary channel making, where the excavated material can be placed on the bank or laid up in the form of a levee at a convenient distance alongside the cut, the clamshell and bucket dredgers seem to have an advantage over the hydraulic machines. Moreover, when any hydraulic machine places the spoil ashore it is done by the aid of water, and the volume of water required to convey the solid matter ashore varies from three to ten times that of the solid matter.

In a country where crops are under cultivation this type of apparatus cannot well be used. Bars only interfere with navigation at and during low-water periods; it is at such times that they can be most easily and economically cut through, but at such periods the river banks themselves are far above the water surface, and if, as has been stated, the banks are 15 feet or more in height, the cost of pumping the material to this height again becomes excessive and ceases to be economical.

For purposes of bar removal in streams like the San Joaquin and Sacramento rivers it is doubtful if the United States Government would permit the material excavated from any one bar to be redeposited in the bed of the stream, for the reason that much of it would, through the action of currents, fail to remain where deposited, and would find lodgment on other shoals, to the detriment of navigation.

The largest hydraulic dredgers yet built are in use on the Mississippi river. One, known as the Alpha, was built in 1894. The tests, which were published throughout the country, were phenomenal; generally such tests rarely exceeded one minute in duration. Such results have not been maintained in actual working operations. The Mississippi River Commission, however, has reported the work done by this machine during eighty-four days in 1895, based on five separate tests. These tests showed a capacity of 531 cubic yards of sand per hour discharged through 1002.5 feet of floating pipe. In these eighty-four days a record of the performances of the machine was kept, from which the following extract is taken:

	Per cent of total time.
Towing from bar to bar	4.6
Repairing plant	.5
Repairing machinery	2.4
Placing dredge and dropping back	5.9
Operating (actually dredging)	70.6
Sundays and holidays not working	14.7
Boats passing	1.3
Total	100.0

The cost of the machines, monthly cost of operation, and the total number of cubic yards removed are not stated; it is therefore impracticable to deduce from the above record the average cost per cubic yard of the sand removed; but the *Engineering News* of February 17, 1898, states that the cost varied from nine-tenths of 1 cent to 15 cents per cubic yard. The average deduced cost is 1.55 cents per yard.

Another hydraulic dredger, called the Beta, has since been built, but we have no authentic reports of her performances. During the past year, however, two additional hydraulic dredges have been built for use on the Mississippi river. They are supposed to possess all the latest improvements, were built at South Milwaukee, and cost $102,400 each. Each machine is believed to have a capacity of 1,000 cubic yards per hour, requires a crew of from forty to forty-five men when running double shifts, and the monthly running expenses are estimated at a little over $5,000 each. Should these machines come up to expectations, it can be calculated on the above basis that the monthly output would be about 500,000 cubic yards, and the cost would be about 1 cent per cubic yard.

There are two good hydraulic dredgers in California, whose performances are well known. They have from 250 to 275-horse power each; either can be duplicated at an estimated cost of $60,000. They have been working at Oakland harbor and elsewhere. Their working expenses, running one shift per day, are about $2,200 each per month. They have worked in depths of twenty feet of water, have pumped material ashore through 6,000 feet of pipe and deposited the same at heights varying from three to fifteen feet above water level. Their output per hour and cost of delivery in material of different character has been as follows:

Soft, plastic mud—300 cubic yards per hour; cost, 6 cents per cubic yard. Mixed sandy clay and mud—100 cubic yards per hour; cost, 10 cents per cubic yard. Soft hard pan—90 cubic yards per hour; cost, 15 cents per cubic yard. Hard pan—40 cubic yards per hour; cost, 25 cents per cubic yard.

The Government dredge which has for years been working in the rivers of this State is a combination of an endless chain bucket dredge, with a hydraulic apparatus for carrying material ashore. Her original cost was $50,000; the average cost of all work done by this machine has been 8.4 cents per cubic yard.

It is known that the most modern types of clamshell and bucket dredgers now in use in the rivers of this State generally used for reclamation, levee building and channel rectification, cost not to exceed $24,000. Their average output exceeds 100 cubic yards per hour; their monthly running expenses are less than $1000, from which we deduce that the average cost for handling material and placing it ashore does not exceed 4 cents per cubic yard. In fact, contracts can be made to do work of this character at from 5 to 6 cents per cubic yard.

A dredging machine owned by the State would hardly be in use during one-half the time in a year; the cost of maintenance is constant, repairs frequent and expensive; deterioration, whether in use or not, is rapid, and the work which may be required in the rivers of this State is of such a varied character that no one type of machine can do it all economically. Machines suitable in character can nearly always be obtained for hire, or for doing a certain piece of work by contract, at a reasonable price over actual cost.

We do not know of any place on the Sacramento or San Joaquin rivers where, with the improvements in contemplation by the State, it is advantageous to either purchase or build a hydraulic or any other type of dredging machine.

For reasons above stated, and looked at simply as a business proposition, with the amount of money appropriated by the State, and available for the purposes mentioned in the act, we do not feel warranted in recommending the purchase and maintenance of any dredging plant.

M. A. NURSE, Chief Engineer.
W. H. HEUER, Con. Engineer.

A Unique Mining Power.

The following is about as credible as similar "mining items" by space writers in the daily press. It is from the Los Angeles, Cal., *Times:*

L. B. Andrews has been spending a few days in Los Angeles. Mr. Andrews has mines south of Death valley, in San Bernardino county. He says that within the past few months he has discovered some rich stringers of gold-bearing quartz between Shadow mountain and Death valley. His ingenuity had been, however, severely strained in devising means of working the ore. Considering the distance to railroad transportation, he deemed it out of the question to ship his ore at a profit. Wood and timber there were none, and only sufficient water for camp purposes and an arrastra. No feed in sufficient quantity for animals was to be had, and it began to look as though Mr. Andrews would be forced to abandon his find. "I was about to pull up stakes and break camp," said he, "when an idea struck me, and I determined to carry it out. The section in which I am located is particularly sandy, and the wind blows at times with great velocity. I thought that a means could be devised for utilizing both. To think was to act, and I proceeded at once to secure the necessary material for my plant. I first built an immense bin, capable of holding many tons of sand. Below this bin I erected a large overshot wheel, gearing from the wheel to an 8-foot arrastra, which I had constructed. Alongside the sand bin I also erected a windmill, and to this I geared a line of elevator buckets, each bucket capable of holding about ten pounds of dry sand. After I had completed the work, I turned my windmill loose. The buckets would take the sand and pump it into the bin; from the bin it found its way to the overshot wheel, and from the wheel I derived abundance of power with which to run my arrastra. I have a calm once in a while, but as my bin is capable of holding a large surplus of sand, so far I have been able to run continuously, with the exception of a few hours, and with proper regulation I do not think I would have lost that time.

"Had I sufficient water for milling, I am confident that I could keep a 5-stamp mill going with my sand power. I have now had my arrastra working continuously for fifty-two days and nights, and am pleased with my new power. I have not found it necessary to make any repairs, except for the first few hours in starting, and since then everything has worked like clockwork."

Mr. Andrews showed as an evidence of his first work a 42½-ounce gold brick, valued at about $750. He proposes to at once take out letters patent on his new device, as he believes that ere long the power will be in general use throughout all the desert sections.

Science's Newest Wonder.

One of the most interesting features of the Paris exhibition of 1900 should be Herr Szczepanik's apparatus, by means of which actual scenes are made visible to people hundreds of miles away from the spot. The objects are to be reproduced in all their varieties of color, light and shade, and every phase of movement is to be represented. Such is the promise of the inventor, and the facts that he has received nearly a million and a quarter of dollars for the exhibition and French rights of his patent would seem to prove this poor Galician schoolmaster has really solved the problem on which many people have been working.

Herr Szczepanik calls his apparatus the "telectroscope," because it renders objects visible in their natural colors at a distance by means of electricity. The manner in which this is effected is somewhat difficult of clear explanation. From the inventor's representative in London the following particulars have been gathered as to the method of transmission:

Roughly speaking, the picture is broken up into a number of points. Each point is reflected in mirrors and the reflected ray of light is converted into an electric current, which can be transmitted at any distance. At the receiving end the current is again transformed into the corresponding ray of light. This ray of light is reflected in mirrors and the reflection thrown upon a screen. Now, it follows that if all the points of a picture are taken in very rapid succession, the resultant reflection on the screen will be the entire picture.

In greater detail, it seems that there are two mirrors at the receiving end and two more at the transmitting end. Each mirror has its surface coated with some opaque substance. Across this opaque covering a straight lined scratch is made with a needle or knife, so that only a narrow linear strip of reflecting surface is exposed. The purpose of this is that only a single line of the object under observation may be exposed to the reflective influence of the mirror. The mirror (the first one in which the object is reflected) is fixed on a pivot, by means of which (with the aid of an electro-magnet) it is continually oscillating, so that the lines of the object under observation are continually changing.

Each of these single line pictures is broken up into points by means of the second oscillating mirror, which is placed at right angles to the first, so that its reflecting line is at right angles to the reflecting line of the first. As two lines intersect each other in a point, it follows that only a single point of the reflecting line of the first mirror will appear in the second mirror, and therefore only the reflected ray which corresponds to this point will be reflected in the second mirror. The two mirrors oscillate synchronously.

This ray of light, which corresponds to a certain point in the picture, is converted into an electric current by the employment of an electric battery with a selenium cell. The property of a selenium cell is that its electrical resistance varies with the color of the light to which it is exposed; it is energized in different degrees by different rays. A blue ray, say, will have a very powerful effect upon it, while a red ray will set up a very weak current.

This electric battery is connected by wires with an electro-magnet at the receiving end, where the electric currents are to be reconverted into rays of light. The electro-magnet will accomplish this by moving in sympathy with the electric current sent out from the transmitting apparatus, and its movements will necessarily correspond to the nature of the ray reflected. A blue ray, for instance, would move it a considerable distance, while a red ray would only slightly deflect it. This magnet is made to move a prism, which is placed in front of a strong white light—either the light of the sun or an electric light. The action of the prism will break the white light up into seven prismatic colors. These colors are spread out in a spectrum.

The prism being moved by the electromagnet, it will necessarily revolve just so far as to bring the required color into view. This color will now be reflected in one of the two mirrors at the receiving end. And just as the action of the other two mirrors was analytic, so the action of these two is. Each point of the picture is reflected on a screen, and as the points follow one another in very rapid succession indeed, the eye of the observer will take in the impression of the entire picture as if its points were all presented to it simultaneously. The picture can be made to last as long as may be desired by constantly reproducing the effect, and at such a speed that the observer is unconscious of any break in the process. It is no more difficult to reproduce a moving picture than a still one, for the inventor explains that "it is the actual picture which is reproduced, and not a mere record, as in the case of the cinematograph."

Another point claimed is that there is practically no limit of the distance within which the apparatus can be used. With the possibility of a telephone wire 1000 miles long, such as that between Chicago and New York, the inventor thinks that the telectroscope wires might be of any length. Such an instrument, of course, opens up a wide field of possibilities. Scenes of foreign travel, battle fields during action and the eclipse of the sun are only a few of the things we might have seen recently, while sitting comfortably at home, had Herr Szczepanik had his machine well established a little earlier. As it is, the question arises, has not this Galician genius done away with the necessity of visitors actually going to Paris in 1900?

In the April *Century* there are several papers devoted to the Pennsylvania coal regions. H. E. Rood writes of "A Polyglot Community." He says, concerning the foreign miners: The first purchase made by Slovak or Polack is a revolver, by Italian or Sicilian a stiletto; then the newcomer buys a silver watch; and after that is secured he begins to save money. If the Slovak or Polack is particularly thrifty, he postpones buying a revolver for several months, and carries in one pocket a round, hard stone, large enough to crush a man's skull, and in another a piece of iron filched from the colliery scrap heap. The Italian or Sicilian, too poor or too penurious to afford a stiletto, buys, begs or steals a long file, and sits down in his shanty or by the roadside, with two or three stones, and grinds it to a keen edge and a needle-like point. Then he fastens the blunt end in a corn cob, and has ready for use a weapon of no mean possibilities. Once armed, however, and provided with a watch, the foreigner manages to live at a total expense of about $6 a month—and this may be regarded as a liberal estimate in most instances. The remainder of his wages is saved toward the purchase of a vineyard or farm in the old country, whither almost all expect to return and spend their lives.

The problem of the most available and efficient method of public lighting still remains to be solved, service and economy being the great desiderata. The plan of very high towers with clusters of electric lamps, calculated to light extensive areas, is generally declared to have proved a failure, leading to their abandonment; towers of 125 to 150 feet, supporting two or four lamps, and placed at frequent intervals, are reported in a few instances as being successful, but in many others have been superseded by a different arrangement. The suspension of electric lamps at the center of street intersections, the method most generally adopted, has been regarded as somewhat desirable because of the superior radiation, but, on the score of appearance, the mast arm is pronounced much preferable. A height of 35 or 40 feet has many advocates as the most effective for arc lamps, but, as showing the difference of opinion in this matter, different cities suspend their lamps anywhere from 8 to 40 feet aloft.

Accumulation of Amalgam on Copper Plates.

Discussion of the paper of R. T. Bayliss (published herein) on the accumulation of amalgam on copper plates, continues. F. Owen, as noted some time ago, said:

In connection with the discrepancy observed by Mr. Bayliss in the relative fineness of the bullion obtained afterwards by scraping the same plates, a somewhat similar experience with a different class of ore may be of interest.

The observation to which I refer was made at the El Silencio mine, situated at Remedios, department of Antioquia, Republic of Colombia. The ore consisted of auriferous (mixed with a little arsenical and occasionally antimonial) pyrites, galena and zinc blende. The proportion of pyrites in the ore ranged from 1 to 12 per cent. The average assay value of the ore was one ounce gold and five ounces silver per long ton. It was mined at a depth of from 220 to 285 feet. The gangue was quartz and the country rock syenitic granite, often much decomposed, so that it was easily crushed. The proportion of silver to gold was found to be considerably higher in the galena than in the pyrites.

The ore was treated in a wooden 16-stamp mill, common in Colombia and Brazil. The shoes were of cast iron, weighing 140 pounds, and the total falling weight was 200 pounds. The mill was run at forty drops of five inches per minute. The screens were of 20-mesh diagonally punched Russia iron. Silver-plated copper plates, 4 feet long by 2 feet 6 inches wide, and set at an inclination of one in twenty, were used outside the battery only and were cleaned up once in twenty-four hours. The usual grade of bullion produced was: Gold, 600; silver, 350; total, 950. The amalgam contained from 55 to 60 per cent of sponge gold, which lost from 1.5 to 2 per cent in melting.

In February, 1891, four old plates, which had been in use from two to two and a half years, were scraped and produced bullion to the value of $22,500. The amalgam obtained by scraping contained from 45 to 50 per cent of sponge gold, which lost from 3 to 4 per cent in melting. The grade of the resultant bullion averaged: Gold, 450; silver, 300; total, 750; whereas, judging from the proportions usually obtained from the plates, one would have expected it to show: Gold, 473; silver, 277. After chipping off all the amalgam as far as practicable, the plates were melted down into thirty auriferous copper bars, which realized $750.

At the Atlantic City meeting of the A. M. I. of M. E., February, '98, C. N. Fenner of New York said: "A possible explanation of some of the phenomena of amalgamation cited by Mr. Bayliss and others has occurred to me. We know that if to a quantity of mercury gold and silver are added until a putty-like paste is formed, and if this mass is spread on a flat surface and pressure is applied, a more fluid portion of the mercury will be squeezed out from the rest, carrying gold and silver with it. The proportion of gold to silver will depend, I think, upon various causes and conditions—the relative chemical affinity which gold and silver have for mercury; the amount of pressure used; the presence of other metals; possibly also the temperature and other minor influences. In most cases, however, the proportions of gold and silver in the two portions will be quite different. This is in conformity with the generally accepted theory that amalgams form definite chemical compounds, which, however, are often either dissolved in an excess of mercury or mixed with an excess of the solid metal.

"This operation must not, of course, be confounded with the process of straining the mercury through chamois, which latter holds back nearly all of the foreign ingredients and permits the mercury to pass through.

"In order to confirm and illustrate the point to which I wish to call attention, the following experiment was made:

"Gold and silver were thoroughly incorporated with mercury, forming a moderately stiff amalgam. This was pressed between two glass plates, and the portion that oozed out in drops was separated from the dry residue. Each part was melted with lead and assayed for gold and silver. The more fluid part yielded 9.4 milligrammes of gold and 164.4 of silver. The residue yielded 7.8 milligrammes of gold and 159.75 of silver. In other words, the ratio of gold to silver in the more liquid amalgam was as 1 to 17.5, while in the residue it was as 1 to 20.5.

"These facts have, I think, a bearing upon the phenomena of scale-formation which have been discussed. When a free-milling ore passes over an amalgamated plate, the gold and silver, and small quantities of other metals, are caught by the mercury. In most cases the process of cleaning-up removes the resulting mixture. Occasionally, however, due perhaps to less fluidity of the amalgam, the pressure of the scraper effects a partial separation, in a manner similar to that of the experiment cited. The mercury squeezed out has probably always a tendency to carry with it fixed relative proportions of gold and silver, as influenced by chemical affinity, but various other causes greatly modify this result.

"I think there can be little doubt that silver has in general less tendency to amalgamate than gold. The increase in the proportion of silver at a distance from the battery discharge, which means that more gold relatively is caught at first, supports this proposition. At the Drum Lummon mill the cleanup bullion had the ratio of silver to gold of 1 to 1.25, while the ratio in the scale was 1 to 0.76; at the El Silencio mill the ratio in the cleanup was 1 to 1.71, and in the scale 1 to 1.50. These figures also apparently show a tendency of the gold to follow the mercury."

Shaft-sinking (on the Witwatersrand), with few exceptions, has been done by native hand labor, the rate of progress in a well-started shaft being from 60 to 164 feet per month, 156 feet being done in the west shafts of the Simmer & Jack East for the month of July and 164 feet in the west shaft of the Angelo Deep for the month of August, the former in quartzite and the latter in slate. This rapid rate of sinking could not have been much exceeded by machine drills, for the time lost in sinking is spent in removing the dirt from each succeeding blast, which must be done by hand labor and occupies at least one-half or five-eighths of the whole time. For this work the highest wages paid to natives is 2s 6d per shift, with the incentive of a bonus per foot for sinking in excess of a certain amount per month. The average rate of sinking for the first nine months of 1897, in two deep shafts in which rapid work has been done, was a trifle over 100 feet per month, and the cost per foot, including white labor, native labor, compound expenses, timber, explosives, lubricants, fuel, miscellaneous stores, maintenance, and engineering fees, was £21 19s 7d.—H. H. Webb and B. Yeatman, Engineering Magazine, April.

The demand of the hour, the crying want of the age in every trade in every department of commerce, in every occupation, in every business, whether great or small, is for men and women who know how to do things, to do them accurately; to do them at the right time; to do them with neatness and dispatch. There are plenty of people who do things after a fashion, who are satisfied with loose-geared and slipshod methods, whose highest ambition is to get through the work of the day, the week or the month and draw their pay; who take no pride in their work, find no enjoyment in seeing the best possible results grow out of their efforts. If the "boss" will let it pass, it suits them all right, good or bad. They have no interest in the outcome of their labor, except that which grows out of being able to draw their pay, which they always want to measure by the time that has expired, rather than by the efficiency of the work they have done, or the profits which may have accrued to their employers. The only stimulus to activity which they know is a sordid one, and has relations to the cash it brings.

Change in Mining Methods.

Readers who keep an eye on Eldora, the new mining camp in Boulder county, will have an opportunity of contrasting modern development methods with those which prevailed in Colorado some years ago. At the southern end of the Gilpin gold belt Empire is located. Thirty years ago Empire was the scene of a gold placer excitement, followed by considerable development work on a number of large veins. Yet no railroad followed in the wake of this development, and when the stamp mills failed to extract the values the mines were practically abandoned.

It is different at Eldora. The stage-coach tracked the prospector into that district, and in less than a year the telephone followed, supplemented by the railroad surveyor. The camp has at present a large tunnel under way that will answer both drainage and transportation purposes for a number of mines. An electric power plant and a tramway system are also projected, so that the first shipments of ore to the treatment plants will be facilitated by appliances which Cripple Creek secured after two years of trial, and which Leadville had to wait for in spite of the millions her bonanzas yielded in advance of the railroad's approach.

In the matter of ore treatment Eldora is not a one-process camp. The failure of stamps will not tie up the mines as it did in the pioneer days of Empire. Concentration, cyanide, chlorination and smelting are all in order, with agents waiting at the mouth of the mines to bid on the ores.

This change in conditions illustrates the rapid gain in output in this State as compared with former years, when mining was costly, transportation difficult and high, ore treatment crude and the price of machinery and supplies at figures which prevented the handling of low and medium grade ores. As the two latter classes far exceed in quantity the high-grade material, it is easy to account for Colorado's expected gain of 25 per cent this season, lifting the State's gold output from $24,000,000 in 1897 to $30,000,000 in 1898. And the end is not yet. Dumps that were made at high cost in Empire thirty years ago are now moving to the modern concentrators in that camp in the buckets of an automatic tramway, which reduces to a fraction the cost of hauling.—Denver News.

In an effort to secure perfect combustion by stirring of the air introduced across the firegrate of a steam boiler, and to avoid blow-pipe flames that might injure the plates, M. Poillon has adopted the following arrangement: The air inlets are, at the upper level of the grate which receives the coal, as narrow as is necessary to completely burn the whole of the fuel with a minimum of air, and at a slight pressure in order to avoid drawing along the ashes into the flues; and are wider below than above, to facilitate access of the air, and to force the flames to spread out in the form of a fan, while the inlets of the first series of plates or bars (counting from the firehole door) are inclined backwards, so that the air issuing from these inlets is deflected towards the bridge. Comparative trials, carried out by Audresset, manufacturer at Louviers, in the French department of the Eure, with a boiler having 79 square yards of heating surface, and fitted with a feed-water heater of 14½ square yards of surface, are said to have showed a saving effected by the Poillon grate amounting to 22 per cent.

What They All Say.

W. A. Scott, representing the MINING AND SCIENTIFIC PRESS, was a pleasant caller at the *Miner* office yesterday. Mr. Scott represents the best mining journal published in the United States. Mojave Miner, Kingman, Arizona.

Chas. G. Yale estimates the year's output of gold from Alaska at $20,000,000.

Alternating Apparatus.

Fig. 2 illustrates the standard belted type alternator, built by the Walker Co., having a sub-base *a* upon which is mounted the stationary armature ring frame *b*. This frame is divided into halves on a horizontal plane, so that the upper half can be removed to inspect and repair the armature bobbins or to remove the inductors. The armature core, which is made with inwardly projecting teeth, is of laminated steel, held firmly in the armature ring frame. The armature coils, rectangular in shape, and machine wound, are arranged around its inner surface, imbedded in slots formed on the inner periphery. The armature core is ventilated by air ducts passing radially through its mass, as in the revolving armature of the direct current machine. The armature frame is hollow, with openings shown at *c*, permitting the air to circulate through the armature air ducts and around the core iron and armature coils. The entire armature with its frame can be moved parallel with the axis of the shaft by removing the bolts *d*, which fasten it to the sub-base, thus uncovering the armature coils for inspection or repair, without the necessity of removing the upper half of the armature. The inductor *e* is carried by the shaft *f*, which is made to rotate in the bearings *g*.

This inductor consists of a hub made of steel, with radiating arms or spokes at either end, which spokes alternate in spacing and have their outer ends bent into line over the center of the hub, leaving an annular space around the hub, where the single field magnet spool is carried, wound with the shaft as its axis. The ends of the inductor spokes are tipped with blocks of thin laminated steel to avoid heating them by the formation of eddy currents. Two extensions of the hub are provided—one outside of the inductor arms at either end. Upon one extension is carried a pair of collector rings *h*, which carry the current from the exciter to the field magnet coil, which rotates with the inductor.

The company is now installing a long-distance transmission plant at Dallas, Texas, which is expected to be placed in operation by May 1st.

The Walker Company is represented by H. C. Wybro, Chronicle Building, San Francisco.

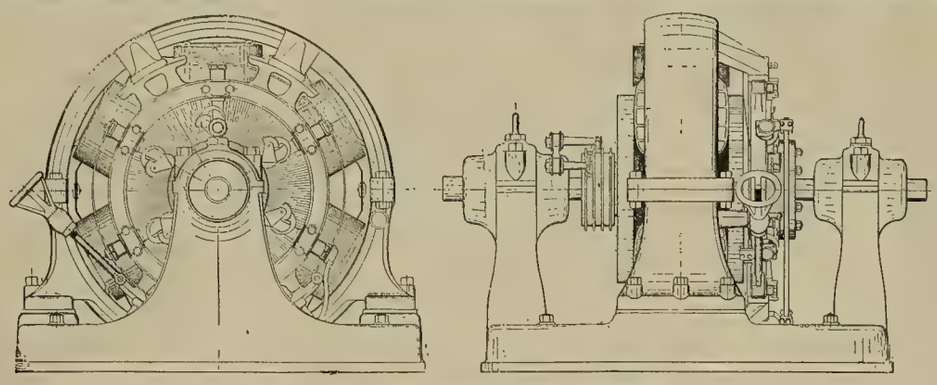

FIG. 1.—WALKER ROTARY TRANSFORMER.

How Coke is Made.

Some one has called coke "mineral charcoal." He meant that coke was soft coal from which the gasses had been expelled by heat out of contact with air, just as wood is made into charcoal by being burned without air. The crushed coke, which is becoming a favorite fuel with housewives and cooks, is the coke left as a residue in the making of illuminating gas. It is soft, dull black and has a pumice-like texture, but the coke which is made for foundries and blast furnaces is hard and is of a silvery gray color, almost metallic in its luster. This is the Connellsville coke, produced in the coke region of Pennsylvania, made famous by its bloody labor strikes and fatal conflicts between the "Huns" and malitia. Thousands upon thousands of tons of coal are mined in the Connellsville country and burned in the thousands of ovens into coke, and when any labor trouble checks the output of this region, foundries, machine shops and blast furnaces all over the country shut down. The two experimental ovens which were built in this district fifty-three years ago have grown into 20,000 ovens, and the few bushels of coke which the pioneers tried vainly to sell have expanded to over 5,000,000 tons yearly.

The very nature of the industry connects the coal mine and the coke oven with the closest intimacy. The ovens stretch out from the shaft top on either side of the railroad tracks, built so close together that the "bank" looks like a solid wall, pierced with low arched windows set in at short intervals. Over the bank ovens runs a narrow gauge track, and steam and smoke cloud the perspective. The Connellsville coke region is the largest producing district in the world, and their coke-making has reached its highest point toward perfection. The Connellsville ovens are what is know as the "beehive" type, varying from 10½ to 12½ feet in diameter and from 6 to 8 feet in height. Each oven produces at a charge from three to four and one-half tons of coke each twenty-four hours, which is the length of time required to produce coke from coal. All coal will not coke, for a non-coking coal will crumble with the heat, whereas, a "coking" coal will hold its substance and become a mineral sponge when the gasses are driven out.

When the coal is brought to the shaft top from the bottom of the mine, it is dumped into chutes which convey the coal to the "larries," as the small dump cars which run on the tracks over the ovens are called. Small locomotoves draw the larry wagons to the ovens in the larger plants, but in others, steel cables, horses or mules are the motive power used to carry the coal to be coked. Time and labor are saved by machinery in the mine, on the shaft top and around the ovens. The mine cars brought up on the "cages" from the bottom of the shaft are pushed off the cage and an empty car run on automatically, and other forms of self-dumping cages are used. The coal slides down the chute and over the screens into the bins from which the larry wagons are loaded.

When larries reach the ovens they are dumped and the coal slides down. When an oven is charged the coal is leveled down and the door is bricked up, and all the chinks and openings are closed with loam, except a space of about two inches at the top of the door, which extends across the full width of it. The heat of the oven—for a full charge of coal is put in as soon as the charge of newly made coke has been taken out—set fire to the coal on top. The draft and of course the air are so regulated that the coal burns from "out to in," and the amount of air necessary to keep up a slow, smoldering combustion is regulated by closing or opening airways in the door. In forty-eight hours the coal is coked and the door is broken open, and the glowing coke in the oven is drenched with water to cool it, so that it will not set fire to the cars, for the coke is loaded directly into the freight cars standing on the tracks before the bank of ovens.

Enormous quantities of water are used in cooling coke. As it requires about 600 gallons of water to cool one charge of coke, the Connellsville district, when all the ovens are at work, uses up over 5,000,000 gallons of water a day, enough to supply a town of 50,000 inhabitants. Sometimes this water has to be pumped from a distance, for the mine water is strongly impregnated with sulphur, and sulphur is just what the coke maker does not want in his product. One large coke works in this district, in order to be assured of pure water pumped it from a river eleven miles from the ovens, using an 8-inch pipe which had formerly been used for supplying a town with natural gas. The coal mined in the Connellsville district is remarkably pure and is all coked. The vein from which is taken is 9 feet thick, and the coal is mined on the "room and pillar" system. The great loss of life caused by miners using naked lamps, and so igniting the explosive gases which collect in the workings, has led many miners to adopt the electric incandescent light for the shaft, bottom, pump-room and stables, and the miners are required to carry safety lamps. As the light is none too good, many miners take fearful risks by using naked lamps. The Connellsville district has been the scene of many accidents and great loss of life.

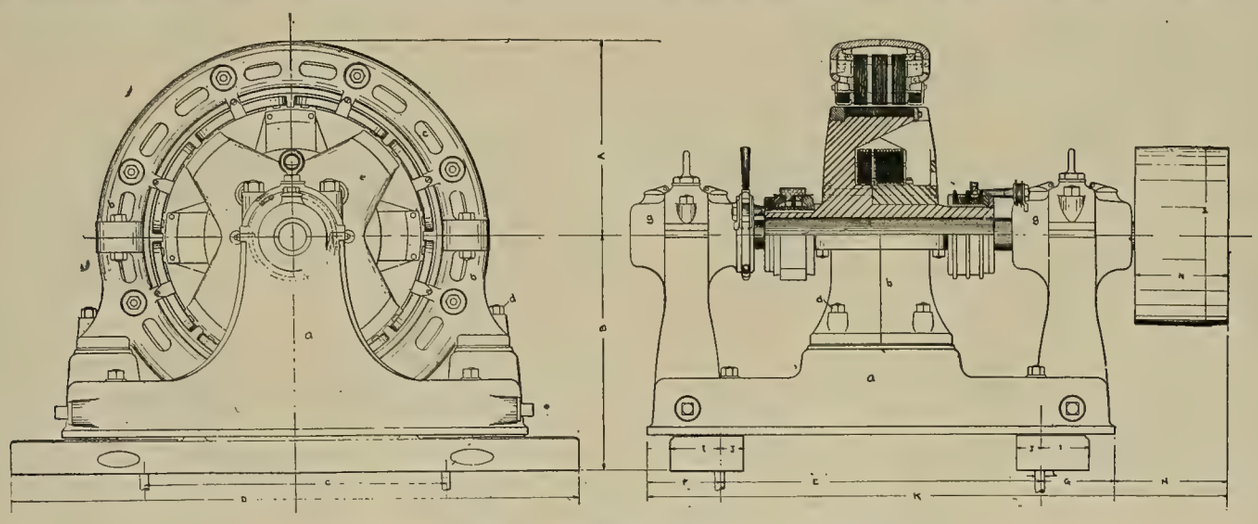

FIG. 2.—GENERAL DIMENSIONS 8-900 50 ALTERNATOR.

The Trade School.

One-fifth of the able-bodied population of the United States is said to be engaged in the mechanic arts. Such of these, and the number is by no means small, who are foreign born, had the advantages of a thorough-going system of apprenticeship and are equipped both by education and experience for their special phase of industry. To such men their aptitude for a business is a matter of second nature. It was not obtained by memorizing rules, but by normal training. It took time, in many instances covering six or seven years, and it involved discipline, not always of an agreeable, but always of a helpful kind. The modern, or rather the American idea, wants as little as it can of both, and the apprenticeship system is nothing less than a tyranny or a prolonged penance to the youth who thinks his parents and the world have made a mistake in not thinking him a man before his second teeth have made their appearance. It is a sad confession, but it's true, that in making men of boys we have made the native mechanic an exception and not a rule. It may have been a mistake in many instances of apprenticeship that the process of education has been unnecessarily slow, and that the cupidity of employers, rather than their good reasons, has managed to secure a man's aptitude at a boy's wages; but it is still a fact that in going to the other extreme we have incurred as many evils in the new system as were ecc-

nomically vicious in the old plan. One thing is sure: that we cannot subordinate the rising generation to the conditions that have placed American skilled industries so largely in foreign hands. The escape lies in the trade school. This is an industrial necessity. In other branches of education outside of the industrial we are flooding the nation with youths, who, if as they think, are fitted for what are called the professions, are yet compelled by the surplus of supply to seek some form of manual labor for subsistence.

Out of every hundred boys that graduate from our grammar schools 1 per cent enter the ministry, 1 per cent become lawyers, 1 per cent physicians, 5 per cent business men and 92 per cent get a livelihood by their hands. The minister takes his course at the theological school, lawyers at the law school and physicians at the medical school; 5 per cent enter business houses to learn the business, which means years of training, but the 92 per cent —have they a similar training? One need not be a prophet to predict results. Want of occupation or a dislike to that into which some are forced by bread-and-butter necessities, leads men into crime. The prison statistics of 1890 show that there were 52,894 white male prisoners in the United States. More than one-half of these had no trade whatever, and three-fourths of those who became criminals through lack of occupation were Americans. It may not be that the lack of trade explains the lack of moral stamina or of integrity, but it is certain that with men who work there is less temptation to crime than with those who do not. If the 92 per cent of educated youths who are turned loose on the world with no knowledge of a trade had been taught even the rudiments of some industrial calling, they would certainly have a better chance of paying for their boots and board without leaning on their parents or a telegraph pole for support. We have an alarming population of this spineless and practically helpless kind, and so long as this special article is the product of a purely mental education, the nation must foot the bill. Under these circumstances we cannot long be blind to the necessity of the trade school. It is the missing link between the school boy and the self-sustaining man. The manual school is but a proviso. In the government consular reports it is stated: "The manual school work in favor with many experienced teachers in the United States, which aims only to impart to the pupil a general manual facility, and to develop adaptiveness, without direct reference to his ultimate specific vocation, is here virtually unknown." The founders of the engineers' school at Amsterdam say: "Our school is to train engineers to run the engines on our steamers," and the charter of the Rotterdam Trade School explicitly states: "The purpose of this association is to train able mechanics." It is on these practical lines of service that the trade school meets what is becoming more and more an industrial and national necessity.

FINE coal or slack coal has proved effective as a filtering material for sewage. It seems to have a special power of removing the putrescent organic matter. The effluent is particularly bright, shows a marked diminution in the quantity of oxygen absorbed, and is perfectly free from odor. The interior of the filter, after a use of many months, has only a slight earthy smell.

Recently Declared Mining Dividends.

Montana O. P. Co., Montana, $1 per share, $40,000; April 15.

Portland, Colo., 1¼ cents per share, $45,000, payable immediately.

Reward, California, 2½ cents per share, $1200; April 9.

Silver King, Utah, 25 cents per share, $37,500; April 11.

Le Roi, B. C., 10 cents per share, $50,000; April 12.

Anchoria-Leland, Colorado, 1 cent per share, $6000; payable immediately.

Champion, California, 25 cents per share, $8500; payable immediately.

Bullion-Beck, Utah, 10 cents per share, $10,000; payable immediately.

Coast Industrial Notes.

—There are nine hundred men employed at the Corral Hollow coal mines, Alemada county, Cal.

—Moore, Ferguson & Co., of San Francisco, have bought 100,000 bushels of wheat in Linn Co., Or. The price was 70 cents net to the farmers.

—J. D. Spreckels & Bro. of San Francisco have sold three tugs to the U. S. Government, to be used as auxiliary protection to the coast in case of war with Spain.

—The Producers' and Consumers' Oil Co., Fresno, Cal., declared a dividend of 25 cents per share on 10,000 shares. The company owns six producing wells and is still prospecting.

—Eastern Nevada cattlemen say that the drought will strike Nevada on account of the little snow on the mountains. The Humboldt river now contains only 10,000 inches of water.

—The San Francisco and San Joaquin Valley Railroad has let contracts for the grading, at a cost of about $200,000, of eleven miles of road adjacent to the entrances to the long tunnel near Rodeo, Cal.

—The contract for the dredging of the Oakland, Cal., harbor goes to the San Francisco Bridge Co. The total bid was $101,500. For the jetty channel the price was 13 cents per cubic yard, $78,000; city front, 41 cents per cubic yard, $23,500.

—W. B. Howell, Assistant Secretary of the Treasury, gives notice that the following places in Alaska have been designated as ports of entry: Juneau, Unalaska, May Island, Kodiak, Wrangel, Circle City, Cook's Inlet (Saldonia), St. Michaels Island, Kuriuk, Unga, Dyea (including Skaguay) and Orca.

—The second period of the sessions of the Nineteenth congress of Mexico was opened at the capital of that republic on the 1st inst. In his message to the congress President Diaz said on the subject of mining: The present condition of the mining industry in the republic is satisfactory. During the period covered by this message, there have been issued 957 new titles, which cover 8297 claims of a hectare each, making a total of 7476 titles issued under the new law in this branch and which cover an area of 58,540 hectares The exportation of ore continues to increase, as by the data published up to date it is seen that the value of the ore exports during the months from June to November, last, reached in round figures the sum of $39,000,000 as against a little more than $28,000,000 in the corresponding six months of 1896. In that exportation silver enters with a value of $34,000,000; gold with over $3,000,000 and lead with $1,200,000. Among the exports also appear antimony and zinc ores. A good idea of the progress of the mining industry may be obtained by observing the working of any of the metallurgical establishments, founded under the protection of government concessions. The Aguascalientes central smelter received 102,349 metric tons of ore for treatment during the year 1896-97. The San Luis Potosi smelter during the same period received 57,653 metric tons, and the Gran Fundicion de Monterey 185,730. The Negociacion de la Valardena, in Durango, treated 53,240 tons. The Compania del Boleo, in Lower California, smelted 171,000 tons of copper ore and that of Mazapil 15,000 tons of copper and silver ores.

Commercial Paragraphs.

MGR. MIDDLEBROOK writes that the Janesville Iron Works, ex. office at Denver, has been awarded the contract for the large compound elevator pump, 1200 gallons per minute, for Daniels & Fisher's store in Denver. Their shops are very busy on mine pump work.

THE Colorado Iron Works Company, of Denver, Colo., made another shipment of three carloads of machinery for the Randsburg-Santa Fe Reduction Co., at Barstow, California. Up to date eight carloads have been shipped for this new mill, now being erected at the above place.

THE Westinghouse Electric and Manufacturing Company has just opened a new office at Austin, Texas. Mr. J. E. Johnson will have charge of the office and of the further extension of the Westinghouse business in the Southwest. The large contracts which this company has been handling in Mexico and the Texas region have led to the establishment of this new center of electrical trade.

THE *Two Republics*, City of Mexico, of the 7th inst. says: Two contracts were let yesterday with Mr. W. B. Pennock, the representative of the Risdon Iron Works of San Francisco, for the installing of two immense hoists with a capacity of 75-horse power, one for the La Joya mine and the other for the Los Pleaydos properties, which is owned by Congressman Ignacion Ibarguengoitia and Mr. Guillermo Brockman, the treasurer of the Esperanza Company. A contract has also been given for the sinking of a shaft in the Los Pleaydos mine, which will be one of three compartments and which will run to a depth of 250 meters.

THE Denver Engineering Works write that in the last few months they have built four special concentrating tables for different parties, each with the idea in view of economical working of their particular ore. These different tables have been tested with greater or less results, and in one instance has been so successful that the company has received an order this week for seventeen tables for one mill. They have also an order for a large cyanide plant for British Columbia, and report an additional order from Mexico for electrical hoists similar to the ones they lately sent to that vicinity. This order is for four electric hoists, three electric sinking pumps, and an electric power plant for driving it.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 5, 1898.

601,707.—TREE PROP BRACKET—Ament & Evans, Riverside, Cal.

601,726.—BALL CASTER—G. L. Boveroux, Oakland, Cal.

601,850.—PROGRAM CLOCK—E. F. Burrill, Oakland, Cal.

601,887.—CAKE BEATER—A. W. Custer, New Whatcom, Wash.

601,795.—DRAUGHT EQUALIZER—G. F. Hillegas, Lane county, Or.

601,853.—VEHICLE WHEEL HUB—G. A. Krohn, Goldgulch, Cal.

601,835.—BATH GOWN—H. & H. E. Law, S. F.

601,972.—WINDMILL—R. Leonhart, Jr., Fresno, Cal.

601,993.—SHORE PROTECTOR—T. B. Lovdal, Sacramento, Cal.

602,023.—DUSTLESS ROAD—F. W. Mattern, Los Angeles, Cal.

601,904.—BEET DIGGER—L. Pike, Anaheim, Cal.

601,845.—ASH RECEIVER—S. M. Smith, S. F.

601,916.—ROTARY ENGINE—C. Triplett, Leland, Or.

601,743.—CULTIVATOR—J. A. Webber, Vancouver, Wash.

601,920.—PUMP—M. L. G. Wheeler, North Yakima, Wash.

601,694.—RESTORING INSULATED WIRE—N. Wilson, Portland, Or.

601,848.—BOTTLE—W. Wilson, Oakland, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE WHEEL HUB.—G. A. Krohn, Gold Gulch, Cal. No. 601,853. Dated April 5, 1898. This invention relates to improvements in hubs for vehicles. The object of the invention is to provide such a construction of wheel hub as will enable the maker to put the wheel together and lock the spokes firmly in place without the use of separate screws or bolts to secure the parts of the hub together. This is effected by making an exterior hub or sleeve with an interior box or journal to receive the spindle upon which the wheel turns, a fixed circular flange projecting outwardly from the hub having the inner face in a plane transverse to the axis and the opposite end of the hub or sleeve cylindrical and partially screwed thereon. Radial plates are fixed upon the fixed flange between which plates the tapered inner ends of the spokes are fitted, a second disk is made to move upon the cylindrical portion of the hub and it has an annular flange projecting from its inner plane face so that the flange will enter corresponding grooves or channels made in the inner ends of the spokes and when this plate has been screwed up tight against the spokes they will be locked firmly between the two disks and also held by the annular flange. A nut is screwed upon the outer end of the sleeve or hub so as to compress the disk firmly upon the spokes and lock the whole together.

SAFETY ASH RECEIVER.—S. M. Smith, San Francisco, Cal. No. 601,845. Dated April 5, 1898. This invention relates to improvements in that class of containers designed for ashes known as "ash receivers," and the object is to so construct the receiver as to prevent the floor or other part of the building or adjacent inflammable objects being ignited or damaged by heat conducted through the metal of the receiver when hot ashes or live coals are placed therein. It consists essentially in the employment of an asbestos jacket between the exterior and the interior sides and between the double bottoms of the receptacle. The receiver is made with offsets in its sides, the bottom being arched upwardly and having its periphery expanded into one of said offsets or grooves. A second bottom of smaller diameter has its edge turned upward parallel with the sides of the receiver and the periphery of the upper edge is expanded into the other offset or channel after the filling of non-heat-conducting material has been placed in the space intermediate between the two bottoms and the sides of the two parts. The construction is simple and easily made and is very valuable for its purpose.

PROGRAM-CLOCK.—E. F. Burrill, Oakland, Cal. No. 601,850. Dated April 5, 1898. This invention relates to that class of devices in which electric gongs, annunciators, relays, or other electrical or mechanically operated devices for signalling and other purposes are set in operation at prescribed times through the agency of a clock. The times at which these devices are set in operation refer usually to and indicate some kind of a program from which this class of devices has received the general title of "program-clocks." It consists essentially of the dial having an annular flange or circle, a node consisting of a substantially U-shaped plate having resilient side arms or members adapted to embrace said flange or circle and to be adjusted to different points thereon, a finger projecting transversely and directly from the lower extremity of one of the legs of the nodes and being of a substantially right angled triangular shape in cross section. An electrically operated clock hand having an under bent lever on its outer end adapted to extend in the direction of the movement of the hand and to travel up the inclination of the finger and an insulating strip on the under side of the lever covering a major portion and exposing the point so that when the lever travels up the slope it makes contact with the ridge or edge of the finger and thus actuates the desired mechanism.

BOTTLE.—Wm. Wilson, Oakland, Cal. No. 601,848. Dated April 5, 1898. This invention relates to improvements in bottles and is especially designed to prevent the fraudulent refilling of the bottle after its contents have been exhausted. It consists of an essentially cylindrical extension exterior to the neck of the bottle and in line therewith, means for opening and closing the end of said neck, a device upon one side of the extension exterior to the bottle neck through which liquid can be discharged when the neck has been opened, a means upon the opposite side for allowing air to enter to take the place of the discharged liquid, a means for closing the discharge aperture against any introduction of liquid through it, and means for closing the air inlet passage for similar purposes. This device consists of an automatic inwardly closing valve which controls an opening between the chamber in the upper part of the extension and the discharge passage so that liquid is prevented from entering through the discharge passage. There is also a second passage suitably arranged with relation to the first to allow air to enter and replace the discharged liquid and this passage has also a valve or diaphragm fixed in it which while it allows the ingress of air to replace the discharged liquid will arrest the passage inwardly of any liquid.

Personal.

G. WALDRON becomes Supt. Reform mine, Cripple Creek, Colo.

O. H. REICHLING, Supt. Anita mine, Jackson, Cal., is in San Francisco.

R. WALKER has resigned as Supt. Empire mine, Grass Valley, Cal.

J. E. DYE, Supt. Gold Fields Co., Jackson, Cal., is in San Francisco.

C. A. HALLEM, Supt. Two Johns mine, Deadwood, S. D., is in Chicago.

H. C. LEWIS becomes Gen. Mgr. Crœsus Con. M. Co., at Hailey, Idaho.

J. F. WEBB, Mgr. Pochahontas mine, Placerville, Cal., is in San Francisco.

F. ZEITLER, Supt. Champion mine, Nevada City, Cal., is in San Francisco.

A. H. RICKETTS has returned to San Francisco from Virginia City, Nev.

T. B. DILLON, Supt. Centennial mine, Plymouth, Cal., is in San Francisco.

T. DUNGAN, SR., succeeds G. W. Dungan as Supt. of the Trophy mine, Ferndale, Cal.

J. C. DIAMOND, managing owner Limpensel mine, Placerville, Cal., is in San Francisco.

J. T. GRIBBLE, Supt. Reward mine, Nevada City, Cal., has returned home from San Francisco.

DR. DAVID T. DAY, of the U. S. Geological Survey, Washington, D. C., is in San Francisco.

J. C. MCKEE, Mgr. New Vulture M. Co., Vulture, Ariz., has returned home from the East.

W. MCKINLAY, Supt. Providence mine, Nevada city, Cal., is in San Francisco in ill health.

C. R. MARTIN, Supt. Grant mine, Grass Valley, Cal., has returned home from San Francisco.

W. MAITLAND, Supt. Deep Gravel mine, Abrams, Cal., has returned home from San Francisco.

J. M. WRIGHT has returned to San Francisco from a trip to his mining properties at Tuttletown, Cal.

F. SEARLES, attorney and mine owner, Nevada City, Cal., has returned home from San Francisco.

HON. E. W. CHAPMAN, Gen. Mgr. Taylor mine, Garden Valley, Cal., has returned home from San Francisco.

C. MULKEY, managing owner Spreckels & Mulkey mine, Fairplay, Cal., has returned to his home in Napa, Cal.

A. B. FRENZEL of New York City is at Placerville, Cal., examining mining properties for New York capitalists.

R. H. POSTLETHWAITE has returned to San Francisco from an examination of placer mining property at Yale, B. C.

D. L. COLES, part owner of the Montauk mine, Newcastle, Cal., has returned from New York to San Francisco.

W. B. KERR has returned to Valley Springs, Cal., from Graniteville, where he had been examining some mining property.

T. CLARK, Pres. El Dorado County Miners' Association, and owner Franklin mine, Placerville, Cal., is in San Francisco.

F. RIGAUD of Paris, France, owner in the Ralston Divide mine, Damascus, Cal., has returned from the mine to San Francisco.

F. J. FLETTER of San Francisco, Pres. Brunswick Con. M. Co., Grass Valley, Cal., has returned from an official visit to the mine.

J. K. FIRTH, of the Joshua Hendy Machine Works, San Francisco, is at Bingham, Utah, inspecting property of the West Mountain Placer Mining Co.

I. E. BUSH has decided not to accept the offer of the management of an Arizona property, but will resume his position as Ass't. Gen. Mgr. Revenue mines, Norris, Montana.

Recent California Mining Incorporations.

St. Louis G. M. Co., Placerville; capital stock, $200,000; all subscribed; J. F. Webb, G. W. McKee, T. H. Hayden, T. Schaub, J. F. Webb, Jr.

Republican M. & D. Co., S. F.; capital stock, $1,000,000; subscribed, $600,000; J. Shine, T. F. McGowan, G. E. Stayton of Sonora, A. S. Orcutt of Jacksonville, J. C. Campbell of S. F.

Victoria M. Co., San Francisco; capital stock $1,000,000, subscribed $250; J. J. Dailey, S. T. Gage, C. Juster, C. E. Hayes, C. C. Wallace.

Mining Summary.

CALIFORNIA.

Amador.

(Special Correspondence).—The Pocahontas mine at Drytown this week struck a 4-foot vein on the 600 foot level that assays from $70 upwards, exclusive of sulphurets.

Drytown, April 11th, '98.

Ledger: The Baliol Co. has secured an extension of time on the Maximilian claim and will sink a prospect shaft to some depth. Five stamps of the Baliol mill will be kept running on ore from the surface cuts on the property. ——The Oleta C. & P. Co. will resume the development of its properties within thirty days.——A new shaft has been started on the Wildman - Mahoney property near Sutter Creek.——At the Ironbound near Volcano they are unwatering the old shaft and also driving a tunnel to tap the shaft at a depth of 230 feet.——At the Stud Horse the shaft has reached 100 feet. There is considerable ore on the dump, of good values.——A cyanide plant is to be erected on the Marklee mine to work the old tailings.——McIntyre & Denis have taken a bond on the Ivanhoe at Sutter Creek.——The tunnel on the Endeavor G. M. Co.'s property at Oleta has reached 600 feet. Work was discontinued to place machinery to carry air to the workings.——W. S. Lyle is unwatering the 300-foot shaft on the Fogus at Volcano.——Two shafts have been sunk on the Davis near Oleta, prospecting for gravel.

Republican: Over $100,000 in bullion left this section of the mother lode last week. It represented a thirty-day run of several of the well known producers hereabouts.——The Marsino Bros. are working the Volcano gravel claim under lease and making good wages.——It is declared by a stockholder of the Alma mine that work will be resumed shortly.

Butte.

P. Riordon is developing two properties near Oroville. He has discovered a 3-foot vein of fair grade ore.——R. P. Grace struck a ledge on his farm near Honcut which is said to yield good assay values.——The thirty stamps at the Banner mine are running steadily. The mortar blocks, made of cement instead of wood, and looked upon as an innovation at the time of their construction, are said to stand the strain of constant hammering very successfully.

Calaveras.

At the Green Mountain mine, near Mokelumne Hill, the gravel bank is 75 feet high and prospects from the top to bedrock. They are using 300 inches of water under 275-foot pressure. A dam impounds the tailings. Should the water hold out, the work will continue three months.——The Rowe & Jenkins mine, at West Point, has been unwatered and a 14-inch vein of $40 ore discovered.——Work on the Williams is being pushed.——B. Nixon has found ore of good value.——Beauchemin has several hundred tons of ore ready to mill.——The Hero mine, at Mountain Ranch, is to be reopened without delay.——The Live Oak mine, at Mountain Ranch, contemplates the erection of a steam hoist.

The Davis hydraulic mine at Esmeralda is in operation and meets with success.——Nuner Bros. will resume work on their mine at Indian creek.——A tunnel has been started on another of D. Fricot's claims near Fricot City.——O. and M. Fletcher have bonded a four-fifths interest in the Confidence mine to J. Cronan until October 23, 1898, for $15,000, $1000 of which was paid.

El Dorado.

(Special Correspondence).—The letter published in the MINING AND SCIENTIFIC PRESS from Placerville two weeks ago on El Dorado's slate possibilities was generally appreciated and received favorable comment. It might be added that these several slate quarries are favorably situated both as to the feasibility of quarrying and in immediate proximity to good roads. One particularly, on the southern shore of the American river, is but four rods from the highway, and but three and one-half miles from Placerville. Both from this and from the quarry at Kelsey a tramway to the railroad station at Placerville would be feasible. The expense of production can be reduced to a minimum for the reason that, for a long time at least, no costly hoisting machinery is required. The slate industry here is not followed to any extensive production simply for want of means. The demand is greater than the supply. It can be definitely stated that favorable terms can be had upon these properties. They should form one of the principal products of California, and possibly will with the impetus they have received through the MINING AND SCIENTIFIC PRESS.

Kelsey, April 10th, '98.

(Special Correspondence).—The Hall Con. M. Co., which began work recently on the Lloyd tunnel, which had been abandoned at 450 feet, after running 15 feet cut a 3-foot ledge of fair grade ore. At 480 feet another ledge was cut of about the same size. The work has not yet cut through the greenstone. Power drills are in use, and about 24 feet are made per week. The Spreckels-Mulkey gravel mine, at Fairplay, which was intended to close during C. Mulkey's trip to the Kotzebue sound country, made so satisfactory a cleanup that work will be continued. It is said that 300 carloads paid $4.50 to the man. W. H. Mulkey will manage the property ad interim. The tunnel taps the channel at 450 feet.

Nugget: It is understood that ten additional stamps will soon be put in at the Grand Victory mine, near Placerville.

Democrat: At the Gopher-Boulder development work is in progress; the mill is running on ore from the Gopher. Supt. Husband contemplates extensive operations for the coming summer; water is pumped from the 250-foot level of the Boulder, preparatory to opening operations on that claim, which is operated by electricity from its plant on Rock creek. The mill is run by a 60 H. P. motor. The hoist is run by a 25-inch water wheel; the spent water is conducted into a reservoir and from there used in the operation of the mill.

The *Nugget* says that Salt Lake people have bonded the Lone Star mine at Nashville and are also negotiating for the Havilah and Monitor mines. Work is to begin without delay on the Lone Star.——The Sunrise at Kelsey has been bonded to Eastern people, who have begun work.

Kern.

The Kinyon mine, from a crushing of five tons of ore, received $6500.——The Little Butte is taking out $45 ore.——The output at the Yellow Aster last month was $45,000. The company is said to contemplate putting in power drills, a dynamo and gasoline engine.

Mariposa.

W. Price has bonded the Schroeder mine, near Mariposa, and is pushing development. Last week he took out a piece of ore weighing thirteen pounds, which contained $2000 in gold.

Mono.

At Bodie a test was made of two tons of ore from Copper Mountain that proved a success and active development work will be continued on the property.

Nevada.

(Special Correspondence).—W. R. Chadbourne, Gen. Mgr. Little Johnnie mine, at Leadville, Colo., has been visiting this county during the past four weeks examining mining properties in various sections. He has taken a bond for his company on the Lindsay mine, at Maybert. After making a survey and maps of this property, he has submitted them to his company. The Lindsay has not been worked for a number of years, but has a good record for the time it was in operation under primitive and expensive methods. No depth of any consequence has been reached in this mine. It is favorably located for tunnel operations. Sixteen hundred feet of tunnel will give it a depth of nearly 1200 feet, with water power of over 800-foot pressure. M. D. Conley is developing a property between Washington and Maybert with gratifying results. The German mine, near Washington, which, I am informed, belongs to the Gaston Ridge Co., has been withdrawn from market. Development continues on the Ormonde mine with satisfactory results. At the Eaglebird work is pushed under the new management. Power facilities in this section for deep working are excellent. Maybert is practically in a granite formation. Excepting probably the old Yuba, which reached 800 feet by a vertical shaft, there has been no deep work done in this district, and the company contemplating the reopening of the Lindsay would be the first to do any deep mining by tunnel methods. The Gaston Ridge mine, opened to 700 feet by tunnel, is about ten miles from Maybert in the Graniteville district.

Maybert, April 12th, '98.

(Special Correspondence.)—The St. Gothard M. Co. is pursuing development at N. Columbia through the old Delhi works and meeting with encouraging results. It is reliably stated that they have found an ore body about 70 feet wide of low grade ore, which assays about $2 per ton. The situation is such that the ore can be mined and milled for from 70 cents to $1 per ton. The probability is that a large milling plant will be erected. F. Zeitler is Pres. of the company and F. C. Bigelow is Supt.——The Champion M. Co. at their recent election chose the following officers: G. Kartschoke, Pres.; J. Fetz, V. Pres.; J. Assian, J. S. Schuster, H. Steinegger, J. S. Ott, E. Schuck, directors. F. Zeitler, Supt.; J. F. Holling, Secy.

Nevada City, April 13th, '98.

The Knickerbocker gravel mine, near Nevada City, was purchased at referee's sale by C. Waterhouse for $1500.——The first shipment of ore was made from the Spenceville copper mine. The operators expect to ship 8000 tons this season.——The Grant G. Q. M. Co., who began development of a property adjoining the Idaho, have reached 100 feet depth and 50 feet drift on the ledge. The company is composed of Kentucky people, with C. R. Martin of San Jose Supt.——The Salt Lake Co. that operated in Meadow Lake will resume work in their property, it is stated, in the latter part of spring.——The Fisk gravel mine, near Washington, made a satisfactory cleanup last week.

Supt. Meyers, of the North Bloomfield M. Co., has notified the owners of the mines at Relief Hill and other places in that section who buy water from the Bloomfield Co. that they cannot be furnished with water after the 1st of May. This necessitates the closing of three mines.

C. Pecor, as Mgr., has begun development of a gravel property near Blue Tents.——The Reddik gravel mine, near Nevada City, will erect a 10 stamp mill. G. W. Fletcher of Grass Valley is one of the principal owners.

Placer.

(Special Correspondence).—Near Auburn, Senator Chapman is pushing development on the Three Stars property and making rapid progress.——Opposite the Montauk mine Mr. Chapman is sinking, working three shifts, on the Golden Rule.——Near Forest Hill he is running a tunnel on a property and advancing successfully.

Newcastle, April 11th, '98.

At the Herman mine the main tunnel extends 300 feet to the ledge, thence following the ore body 750 feet, a continuous pay chute averaging 6 feet in width. At least six months' run for the 10-stamp mill remains in the stopes on this level. About 1000 tons are mined in the stopes ready for milling. The company contemplates the erection of a 30-stamp mill to be run by electric power. The generator will be placed on the American river one mile from the mine. Thirty-two men are employed. The mill runs steadily and crushes twenty-five tons of ore per day.

The mines at Weimar are idle, owing to the shortage of water.——Sanders & Co. are working their placer claims on the American river with good results.——Klose & Lozano are taking out good ore near Ophir.——The Pioneer mill at Ophir is crushing fifty tons of ore taken from the Davis ranch.——McLaughlin & Goley are reopening the Centennial mine.——M. Bouk has cleaned and retimbered the old shaft on Big Pine mine, near Auburn. He is sinking through good ore and has reached a depth of 180 feet.——A test run of 100 tons is being made from the Esmeralda mine, near Auburn.——The Mayflower, near Forest Hill, made a test run of 100 cars of gravel which gave satisfactory results.——Sinking in the Maus shaft progresses slowly on account of water to contend with. The shaft is down 190 feet.——The Cash Rock mine expects soon to start its mill.——The Eureka tunnel has reached 2848 feet. Supt. Chappelet expects to start an upraise for the channel within a few days.——In the Evening Star mine a 4-foot ledge was struck at a depth of 65 feet.——C. H. Porterfield is doing considerable development work on his quartz mine near Emigrant Gap. He has run 400 feet of tunnel and the ledge averages 4 feet in thickness all the way in. He has about 12,000 tons of ore in sight, and has completed the erection of a 10-stamp mill. He will soon have his mill running steadily. He is also running another tunnel on a ledge, 14 feet in thickness, in the same neighborhood. Upon this ledge he has a 5-stamp mill, but has been unable to run it, owing to the scarcity of water.

Riverside.

(Special Correspondence).—The Iron Chief property, which is under bond to R. M. Straus and W. L. Shinn, is building a 60-ton per day cyanide plant and a pipe line eleven miles long. This is at Eagle mountain, 140 miles south of San Bernardino.

The Pacific district, forty-five miles east of Salton and thirty-five miles north of the Gold Cross mine, is being developed by shafts on about twenty different claims. The ores are partially free-milling gold, carrying good values. The deepest shaft in the district is 100 feet. A 3-stamp mill is being erected. The Vennita group of five claims is being developed by V. C. Reche and associates of San Bernardino. This group has a shaft 75 feet deep.

The Granite mine, five miles north of the Vennita, has 750 feet of work, and shipped one car of ore which brought $998. The values of the district are mainly gold, though there are some leads of galena. The veins are a contact between porphyry and granite. The district in general is in a low range of hills, surrounded by higher mountains.

Riverside, April 10th, '98.

There are 200 tons of ore on the dump at the Leon mine, near Winchester. The new mill will shortly begin work.

San Bernardino.

(Special Correspondence).—The Stonehammer turquoise properties are located at the lower end of the Death Valley desert. The property derives its name from the number of stone hammers of primitive days found in the locality. Turquoise was discovered here last September. It is found in ledges of decomposed porphyry and bauxite between granite and lime. The ledge is 4 feet wide. The property comprises 500 acres. Surveys are being made at present for obtaining title. The largest piece found in this property to date weighs 210 carats. The greater part of the product is shipped to Amsterdam, where it passes through the lapidary's hands. There are three species of this jewel found here. The first shade, baby blue, is taken near the surface; a little deeper the robin's blue, and deeper down the Persian blue, which is of greater hardness and more value, though the last named is too dark for the American market, and the baby blue is the more popular. Very little blasting is done, most of the work being carried on by pick and shovel.

It is said that a stone weighing 80 carats was found at 80 feet depth in Lincoln county, Nevada, reputed to have been sold for $4000 last September in Denver.

There is also a turquoise mine in Arizona and one in New Mexico. The Stonehammer property is the most extensive thus far discovered.

This jewel is described by Cuninghame Wilson as follows: Massive; comp. phosphorus pentoxide 22.5 per cent; alumina 47 per cent; water 20.5 per cent. Color, pale blue; luster like sealing wax. H.=6; G.=2.75. Dist.: Is harder and bluer than malachite; green feldspar is fusible; turquoise B. B. turns brown and colors the flame green. Occ.: A rare and highly valued gem. It is chiefly found in Persia, and is said to be derived from an ancient trachyte. It occurs in highly disturbed vulcanic regions.

San Bernardino, April 11th, '98.

(Special Correspondence).—The Holcomb Creek M. Co. is developing a property near San Bernardino. A shaft is down 60 feet and a tunnel has been driven 200 feet. The ore thus far encountered is a red quartz and pyrites. Experiments are being made with the possible idea of putting up a cyanide plant.

San Bernardino, April 10th, '98.

Dehm & Luscomb discovered an ore body near Twenty-Nine Palms that yields good assay values.

The Iron Chief mine, recently sold for $150,000, is sinking and drifting. The shaft is down over 200 feet.——A 2-foot ledge has been discovered by L. D. Jensen in Virginia district that assays $60 per ton.

San Diego.

The Hays and Bidwell mines at Poway are producing ore that assays $16 gold and $4 silver.——The Rainbow mine, near Oceanside, is yielding $12 ore.——The Du Quesne Co. has resumed work and twenty men are at work under leases.

Shasta.

In the neighborhood of French Gulch a number of new prospects are being successfully worked.——F. Rossi has started the mill on the Brunswick mine and has a large quantity of ore ready for crushing. It is estimated that sufficient values are out to more than pay for recent development and addition of new machinery.——Wolfe & Wheeler are developing a property in Summit gulch. The ledge is in a contact of slate and diorite, varying from 3 inches to 2 feet. About fifty tons of ore is on the dump, which is estimated to carry $60 per ton in free gold, besides a good percentage of rich sulphurets.——G. Leavitt made a good cleanup on his Washington lease for the month of March. It is expected that the owners of this property will operate it themselves at the expiration of present leases.——Work is progressing favorably at the Gladstone under the supervision of Mgr. Walkotte.——At the Highland Mountain mine, comprising five claims, the company has opened three ledges. Two tunnels are in operation and there are 100 tons of ore ready for milling. This is a new development. The ore is of a good grade, free milling, bearing a good percentage of sulphurets.

Desmond Bros., near Whiskytown, struck a ledge at 135 feet depth which averages $9 35 per ton.——Deveney & Gray discovered a vein at 180 feet.——The Colorado M. Co. continues development with satisfactory results.——The National Mg. Co. is shipping sulphurets.——The Walker Bros., near Old Diggings, have 2500 feet of tunnels and surface work cuts. Their ore body is large and of low grade.——At Middle Creek a shaft 30 feet deep struck a strata of rick gravel. Six men are at work on the property.——Supt. Shepperd has two shifts at work reopening the old Spanish mine near Shasta.——The Mt. Shasta is producing good ore——On the Herron mine development work continues with good results.——J. Driscol opened a paying gravel deposit near Shasta.

Sierra.

Bennaleck & Co. have leased the Phœnix mine at Sierra City and begun work. The mill will be started shortly.

The Sierra Buttes mine at Sierra City is working twenty men and, it is said, will increase the force in a short time.——The Cleveland is running steadily and employing twelve men.

Siskiyou.

Nearly all the large hydraulic mines on the lower Klamath river are in operation. The McLaughlin mine near Salmon Forks is working under a pressure of 250 inches——C. Jilson discovered a vein on his property near Henley.——McGraw Bros. are operating a placer property with success near Ash Creek.——The Vesey Bar Co., below Honolulu, Klamath river, has commenced hoisting pay gravel this week and expect to realize good returns this season.——The Benz Bar Co., at Honolulu, Klamath river, having worked out their old cut from last year, is now constructing a big wingdam covering a large extent of the channel, expected to prove as rich as the section worked last year and early this spring.——The Greenhorn Blue Gravel Co. continues to pay and has a full force working day and night. The company is preparing for an extended run by saving water from channels and springs and by placing pumps in the several shafts and building storage reservoirs.——The river miners on the Klamath are rushing operations to commence hoisting gravel, and a few have already started their derricks. The river being down to the low water mark earlier this season than usual, the work of wingdamming will soon be completed in all the claims, for pumping and hoisting. The yield from river claims during the coming summer and fall is expected to be better than for several years past.

Trinity.

Work will be resumed shortly on the Nash gravel mine, which was closed during the winter.——In the A. B. C. mine at Lewiston a ledge has been found that runs $20 per ton.——Good ore is said to have been found in the Uncle Sam mine at China Flat.

The Indian Creek Hydraulic Co., controlling 200 acres and employing twelve men, are running only about four hands daily on account of water shortage.——The Nash Gravel Mg. Co. is said to have expended upwards of $200,000 in the last two years in adding to the facilities for successful mining.——The Trinity Deep Gravel Mg. Co. has laid 1300 feet of pipe and built half a mile of ditch, but the scarcity of water in Boulder Creek precludes any operations this season.——Peterson & Hovie discovered a ledge near Trinity Center that is from 6 to 9 feet wide that yields $8 exclusive of sulphurets.

Tuolumne.

(Special Correspondence).—The Dreisam group, consisting of the Yellow Jacket, Ophir and Good Luck mines at Arrastraville, is owned by the Dreisam G. M. & M. Co., incorporated under the laws of California; principal place of business, San Francisco. This is the only property under the same management as the Dutch mine at Quartz mountain, notwithstanding the reports that other mines are backed by the same people. Since the present owners obtained control, a steam hoist with a capacity for 1000 feet has been put in operation on a 60-foot shaft, in which sinking was resumed; it is now 95 feet deep and shows a 14-inch vein of good pay ore. An old incline shaft 240 feet deep has been drained, and sinking is also in progress. At the bottom a 22-inch vein showing free gold and a large proportion of sulphurets, is being opened. A 3-stamp mill with complete equipment is being erected and a compressor has been ordered, all of which when installed will run by steam power.

Soulsbyville, April 11th, '98.

The tunnel in the Three Friends mine, near Confidence, is in 70 feet. The ore averages $10.90 per ton.——The *Democrat* reports the finding of rich ore in the North Star mine near Sonora. The vein averages 3 feet.——Sulphuret ore has been found in the Gagnere mine at Tuttletown, a five pound test of which yielded $21 in silver and $37.52 in gold.——The Golden

Crown Co. is developing a property on the East Belt on the line of Tuolumne and Mariposa county, in which the ledge at 200 feet is 10 feet wide. When the shaft reaches 300 feet a mill will be erected.——Wemple & Hilbish of San Jose are the principal owners. The tunnel in the North Star has reached 680 feet. The ore body is said to be large, milling $16 per ton.

Yuba.

At the Davis mine, near Hansonville, the mill is running on good ore.——Thurston Bros., near Woodville, are crushing ore and report fairly good returns.——Spangler Bros., near Strawberry Valley, crush a fair grade of ore from a 20-foot ledge. The capacity of this mill will be increased this summer.——A new mill is to be erected on the Berry claim.——W. Wolf is operating a two-stamp mill at Dobbin's Ranch.

NEVADA.

(Special Correspondence).—J. Meehan of Jackson, Cal., is developing a property near Charleston. The tunnel has reached 300 feet, and is on the ledge, which runs from 4 to 6 feet and assays $23.56 per ton gold. There is considerable ore on the dump. Mr. Meehan says he will put up a mill in July.

Charleston, April 8th, '98.

The cyanide plants at Aurora will soon be in operation. That at Sunshine has started work.——Near Mountain City ore has been discovered that resembles the phonolite ore of Cripple Creek. The ore body is a dyke 100 feet wide. The lowest assays yielded forty-seven ounces silver and $6 gold.——At the Ione mine, near Austin, thirty stamps are in operation. Gen. Mgr. Farnsworth contemplates adding ten stamps.——The finding of good ore is reported in the Pueblo mine, near Winnemucca.——The Jump-Off-Joe mine struck a ledge 3 feet wide, the ore assaying $15.——At the Virgin mines there are 250 tons of ore on the dump said to be of good value. ——The New York Dredge Co. has located three miles of river bed at Garnet. They will build a 120-foot boat for the initial operations, to be followed by more if operations prove successful.——J. H. Perry is meeting with success in his placer mines near Garnet.

The following ore shipments were made over the E. & P. railroad for the week ending April 8: Excelsior mine, 30,470 pounds; Eureks S. Works, 52,500; Jackson, 35,290; Richmond, 71,590.——J. H. Rea has leased the Rock Point mill at Dayton and also the Franklin property, to test low grade ores of that locality.——The De Lamar and April Fool mines at De Lamar are handling 330 tons of ore per day; thirty tons are accredited to the latter.——The Dexter mill at Tuscarora made a $2400 shipment of cyanides ——The judgment of the District Court in the water suit between the April Fool M. Co. and T. E. Dula has been affirmed by the Supreme Court. This suit was tried in Dec., 1896, and, awaiting the final result, little or no work has been done on the Dula claims, which will be shortly resumed now.

Comstock official letters say: In the Belcher mine on the 1200-foot level the north drift from the east crosscut is now in 145 feet. The face is in low-grade quartz. The east crosscut from the north drift on the same level is out 52 feet. The face shows porphyry. On the 850-foot level the joint Belcher and Crown Point west crosscut from the top of upraise No. 1 is out 22 feet. The face is in quartz giving low assays. There were hoisted during the week fifty-three mining carloads of ore, the average car sample assay of which was $18.92 per ton.

In the Savage M. Co.'s ground on the Comstock lode, on the 130-foot level, the main west drift has been cleaned out and repaired a distance of 15 feet; total length, 488 feet. Brunswick lode—The main north drift, 600 level, was advanced 10 feet; total length, 437 feet; face in porphyry and bunches of low-grade quartz. Incline shaft No. 1 has been sunk a distance of 11 feet; total depth, 1181 feet; bottom in hard porphyry.

In the Chollar mine they have placed one set of timbers in the main incline during the week below the 1100 station and are still repairing this incline. They have stopped the west crosscut on the 100 level 60 feet north of the south line and have started an east crosscut opposite it, which is out 12 feet. On the tunnel level the west crosscut 60 feet north of the south line has been advanced 8 feet; total length, 32 feet; face in porphyry and quartz, the latter assaying $20 per ton. In the Chollar Company's ground on the Brunswick lode, incline shaft No. 1 was sunk 11 feet during the week turough hard rock; total depth, 1181 feet on the slope. 200 level—Are saving a few carloads per week of good ore from the streak above this level. They are repairing various places throughout the mine. The electric blower and lighting plant is in operation, and is a success—both in lighting and for running the blowers on the 500 level.

In the Potosi mine on the tunnel level, the joint Bullion-Potosi south drift was advanced 21 feet; total length, 620 feet; face in porphyry and low-grade quartz. It has about 87 feet to go to connect with the Crœsus shaft. The joint repairs by the Bullion-Potosi companies on the Crœsus shaft have been completed for 225 feet. Brunswick lode—Incline shaft No. 1 has been sunk 11 feet for the week through hard rock and is now down 1181 feet on the slope. The main south drift has been driven 23 feet; total length, 281 feet from the north line. The face is in prophyry and low-grade quartz. The hanging wall is in sight on the east side of the drift.

OREGON.

Near Baker City G. & P. Howard from thirty-seven tons of rock netted $1500 in gold. ——At Granite the Boston is pushing development with eight men.——At the Bunker Hill and Ajax properties development continues with satisfactory results.——The Cliff mine is having 100 tons of ore crushed at the Virtue mill. The Collateral mine is delivering 100 tons of ore to the same mill.

Near Henly, in the California Queen mine, after two weeks run of a 5-stamp mill Roberts & Co. netted $2000. This property had been abandoned for fifteen years until a few months ago. The present company has run a tunnel 520 feet. They found a 7-foot ledge of fair grade ore. They contemplate adding an 8 H. P. gasoline engine and making other improvements.——R. D. Chumley struck a ledge of good ore near Baker City.——The Climax, in the same neighborhood, is showing satisfactory results.

At Alicel, G. W. Ruckman contemplates placing a dredge this summer and doing extensive river mining. He states that dredges will also be used on the Snake river properties, owned by P. Basche of Baker City.——The Flagstaff mine, near Baker City, operated by a French company, of which M. Imhaus is agent, will make extensive improvements and additions in its machinery plant. The mine is said to have produced $100,000 last year.——The shaft on the Comstock, in the same neighborhood, has reached 100 feet and is producing fair grade ore.

WASHINGTON.

At Bossburg a new ore body was discovered in the Bonanza mine of good values.——In the Scotia a ledge was discovered that averages $38 per ton.——Assays from the new find in the Tom Thumb mine at Republic gave returns of $12 per ton. The ledge is 7 feet wide.——The Pierre Lake and Flat Creek M. Co. have resumed work. The work on one of the properties is in ore said to run $40 per ton gold with a fair percentage of copper. The company owns 120 acres.

In the Conquest mine near Newport ore has been struck that averages $56, carrying gold, silver and copper. The mine is shipping ore. ——The Rebate mine at Republic, bonded by J. M. Burke, has begun development. The San Poil ledge is widening and the values run from $20 to $30 per ton.——Near Meyers Falls, Black & Carmichael have a 10-foot ledge from which $30 assays were taken.——The Mohican at Flat Creek, in the Colville Reservation, was sold to New York people for $20,000 cash.——In the Republic the ore chute continues from 4 to 8 feet wide and the average daily ore values are from $100 upwards. ——The Everett Hydraulic G. M. Co. near Everett has begun work on their property, employing forty men.

F. Raberg bought the Monroe mine at Republic for $5000, of which 10 per cent was cash, the balance in thirty days.——W. Kane sold the Princess Maude mine for $5000.

BRITISH COLUMBIA.

The output of the Le Roi mine increased during March to 200 tons per day. The shaft is down 750 feet. Drifting on the vein at that level is in progress. The winze on the 600 level is down 40 feet, in ore all the way. The smelter is running 200 tons per day.——The Idaho at Slocan is taking out forty tons a day.——A 6-inch vein was struck in the Whitewater Deep at a depth of 1000 feet.—— The London & B. C. Goldfields Co., whose office is in Nelson, will build a 40-stamp mill on their mine at Ymir.——Near Quesnelle Forks large placer mining operations are carried on by the Golden River Quesnelle Co., Ltd., of London, with a capital of $1,750,000, of which $400,000 is paid up. The company has secured the right to mine the South Fork of the Quesnelle river for seven miles. The company has employed from 400 to 500 men excavating a waste weir to divert the waters, with the necessary gates, nine in number, each 12½ feet wide in the clear, with a lift of 19 feet in extreme flood water. The dam is thrown across the river with a curve, one end against the bulkhead, the other against the rocky left hand bank; the river at this point is about 400 feet wide. This dam is intended to hold back the waters of Quesnelle lake, which cover 140 square miles. The water in the lake has risen every season before the dam was put in from 8 to 10 feet above low water mark, while at the lowest stage the water in the river is from 6 to 8 feet deep. It is estimated this work will cost about $300,000.

ALASKA.

The Mellen M. Co. is developing the Ivanhoe group, comprising five claims at Berners Bay. The company is composed of Indiana people and is capitalized for $300,000. B. F. Von Behren is Pres., W. H. Mellen and H. F. Hoggatt are local managers. Several hundred feet of tunnelling has been driven, exposing two ledges containing from 6 to 10 feet of ore. The Berners Bay M. & M. Co. and the Nowell G. M. Co. will both resume operations soon. The Sumdum, Ketchikan, Snettisham, Funter Bay and Silver Bow Basin will soon be actively at work. Development is planned on the newer discoveries of these localities and the building of mills on some of them has been decided upon. It is said that much attention is given to Southeastern Alaska and new development work has already begun.——The Alaska Commercial Co.'s mine Apollo at Unga shipped $75,000 to San Francisco. The following report on the property was made by T. C. Mayon, the Supt.:

After seven years' work we have the Apollo ledge thoroughly prospected and have done a large amount of developing. The main tunnel is 2600 feet in length. A shaft 400 feet in depth has been sunk at a point 500 feet from the mouth of the tunnel. The value of the ore varies to a great extent, but that which has been taken out this winter is richer than ever. The mouth of the main tunnel is a mile back from salt water, but a wire rope tram covers the distance. The ore is taken out of the deep shaft by complicated hoisting machinery. The ore is handled by a 40-stamp mill and the concentrates are smelted at the mine. The bullion is sent down on the Alaska Commercial Co.'s ships, which are about the only ones calling at Unga.

There are 125 men working for the company at Unga. They get $3.50 per day and really get along better than one would imagine in such a lonely, desolate place. We see hardly any one from the outside during the winter and very seldom get any news from the outer world. Steamers for St. Michaels do not come near us, and we are too far west for the Copper river boats. We always have plenty of supplies and the men have as good a time as possible among themselves. Some of them have been there a long time. Many stay but a few months. The output of the Unga mine runs from $15,000 to $45,000 a month.

The Van Anda C. & G. Co. of 65 Wall street, New York, will erect a smelter with a capacity of fifty tons per day. The company has ten properties.

THE KLONDIKE.

Among the few high priced experts who went to the Klondike were Aug. J. Bowie of San Francisco, whose articles on hydraulic mining in the MINING AND SCIENTIFIC PRESS have given him world-wide fame. It is understood that Jas. R. Keene, now of New York City, paid Col. Bowie $25,000 and expenses for a year's sojourn in the northern El Dorado. With him last July went Alf. Tregidgo of Nevada county, and two other old California miners. By the last mail from Dawson City comes a letter from Tregidgo telling of the latest strike on Arkansas creek. It appears that Bowie and he started a stampede from Dawson. Tregidgo says:

February 22nd, with Friend and Lawson five quick dogs and a sleigh I started for Dominion creek, on a branch of which, twenty-five miles down, called Arkansas creek, good gravel had been struck. It was 6 A. M. when we started. We made a roadside house at the summit of Hunter creek, twelve miles distant, at 7:50 o'clock. We crossed the divide by upper discovery, on Dominion creek, forty-two miles from Dawson and remained for the night. At 4 the next morning we were off again, and made the place at 2:30 o'clock that afternoon. I staked No. 7 above for myself and No. 6 for Augustus Bowie, both of which, I think, are good claims. Mr. Bowie was to leave on the 24th and meet me on 28, below upper discovery, Dominion. Made a rapid trip back to No. 30. I remained the night, expecting Mr. Bowie on the following day. We have purchased No. 28, and as all the claims on Dominion creek are remarkably good, I think we have a fortune in No. 28. We are sinking there but are not yet down to gravel bed. In No. 30, which is only 165 feet south from 28, they have from 3 to 5 feet of gravel, all good for 15 to 40 cents to the pan. This has been opened for a width of 120 feet, and on the bedrock every pan of dirt is worth from $2.50 to $30. On No. 31 they have stripped the bedrock for 51 feet in width, and are averaging over $5 to every pan of dirt they take out. On No. 32 some young fellows from Alameda are working a lay for a year, getting 75 per cent of all they take out. Nos. 33, 34 and 35 are equally good. Fifty thousand dollars a piece would not buy these claims. No. 31, $250,000 would not buy. When I was here before, in December, I could have bought for $10,000 property that is to-day worth $500,000.

On No. 9, above lower discovery, and Nos. 6 and 2, below lower discovery, the dirt is worth as high as $34 to the pan. On Dominion creek the gold is beautiful, much better than I have yet seen on the Klondike—clean and fine, and worth, I should judge, over $18 an ounce. There are 280 claims located below lower discovery, and down as far as 75 below gold has been found in great quantity. Twelve thousand dollars was offered and refused for No. 76. There are 300 men on the creek now, and the trail from Dawson to the end of Dominion is alive with men and their outfits going out to represent their claims. The law here demands that each owner of a claim shall work it ninety days consecutively each year. This is called "representing." I am sure Dominion creek will equal, if not excel, the famous Bonanza creek. The latter creek is staked to 88 above and 118 below discovery, while Dominion is staked 38 above upper discovery and 36 below, and 14 above lower discovery and 280 below lower discovery. Thus there are 206 claims on Bonanza creek, and 316 on Dominion creek, each claim being 500 feet in length. Of course, both creeks have several ravines or "pups" running into them, all of which are fully staked.

On Dominion a "pup" comes in 28 below upper discovery, called Caribou. Another, at 25 below lower discovery, called Arkansas. On this I have No. 7 above discovery and a large one at 171 below, on which there are more than 200 claims staked. Everywhere they have got down to the ground gold is found in quantities.

I was more than surprised at what was brought forth by sinking the four holes at present on the creek. These holes vary from 25 to 8 feet in depth. The gravel is from 3 to 7 feet deep under the muck. On Friday afternoon Mr. Bowie arrived. We remained over night on No. 30, and the following day made an inspection of the creek between the two discoveries. Mr. Bowie was well pleased with what he saw.

On our return we went into Alexander's cabin, on 31, and panned out some of his gold. We got $4.50 in one pan and $6 in the next. Mr. Alexander had a fruit can half full of gold from his panning since he struck the gravel. Of course, he is greatly excited over his property, and why should he not be, as to either sell his claim or work it will insure him a large fortune. On 28, our mine, we are building a cabin, which is nearing completion. We told our men where to sink their holes, and the following morning started for Sulphur creek.

At the bottom of this last descent we came to claim 62 above discovery on Sulphur creek. Here some one had left a tent and a stove. Here we met Messrs. Pond, Fairbanks and Whitney. Sulphur creek, like Dominion, is being rapidly developed. On claim 2 above, belonging to young Pond (ex-Mayor Pond's son) and Fairbanks, they have struck it rich. On 13, 14 and 15 above discovery, and on 6 above and as far down as 45 below, good prospects are found. The same lively condition prevails as on Dominion, and undoubtedly Sulphur will prove a great gold producer. We have No. 3 above, and, to be sure, this is a grand property. Sunday night we slept in a cabin on No. 13, owned by Mr. Kane. We gave such instructions to our men as were necessary, and on Monday started up the canyon again. Ascending the steep mountains we had to double up, *i. e.*, hitch all the eight

On May 20th the Johnson=Locke Mercantile Company will dispatch from San Francisco the Steamer "Tillamook" for Dutch Harbor, Nunivak Island and St. Michaels.

This will be the First Steamer Sailing this Season for the North. The At=tention of Owners of River Boats Outfitting at Dutch Harbor or Nunivak Island is Called to this Early Departure. As the Space on the "Tillamook" is One=Half Engaged, Early Application for the Remainder is Necessary.

The "Tillamook" will Also Connect at St. Michaels with River Steamers for Dawson, and the Opportunity for an Early Trip up the Yukon River is thus presented. Apply to the JOHNSON=LOCKE MERCANTILE CO., 609 Market St.

dogs to one sleigh, and after they reached the top of the steep place come back for the other. At last we reached the last dome and descended down the mountain side into Bonanza creek, striking it at claim 61 above discovery. We reached Mr. Byrnes' cabin at No. 35 above at 7 P. M. Tuesday, March 1st, we started out for Dawson. From 47 above discovery on Bonanza creek clear down to 86 below, a distance of eighteen miles, is one continuous line of cabins and shafts. At each shaft there is a large dump of gravel awaiting the summer and water to be washed.

At 8 above we struck the junction of Bonanza with El Dorado. At the latter creek the richest dirt in the country is being found. They are taking out from Nos. 4, 5, 6 and 10 dirt worth over $100 to the pan right along, and all the other claims from 1 to 37 have good big pay. It is estimated that the Berry boys will come close to $750,000 this year from 4, 5 and 6, which they own, and No. 10 is reported to be even richer. Over $4,000,000 is expected from El Dorado creek this season. We are interested in No. 19; 17 and 18 will take out $250,000. On Bonanza $2,000,000 to $3,000,000 will come out, and from Hunker, Dominion and Sulphur at least $5,000,000. Some put the season's output at $15,000,000.

We reached 61 below on Bonanza creek. Then we went to No. 97. We reached Dawson at 5:30 P. M., tired out, but much satisfied with our trip. Friend's bill for himself and dogs for six days was $400. The thermometer now is 8° above zero. The day is warm. The northern lights at night are something grand, like a transformation scene at the theater. The town is dull and will be until they commence washing. When they commence washing the gravel they have been extracting all winter, and gold will flow like water. At present dust is scarce, as so many have gone out over the passes, and the saloons and stores have taken in the remainder; but those who have good claims—and their name is legion—can borrow all they require to spend at rates varying from 5 to 10 per cent per month, payable when they wash out.

All private mail that goes out costs $1 a letter; penholders, 50 cents; nibs, 25 cents; paper cannot be bought at any price; nails are scarce at $5 a pound. One man, who has twenty pounds of No. 12 nails, expects to get $1000 for them before the steamer comes in. The way they distribute mail here is peculiar and awfully slow. Day before yesterday there was a sign over the postoffice door, "All letters will be delivered to-day to persons whose names commence with A to K; Saturday from K to the end of the alphabet."

The Government has decided to establish the Yukon headquarters of administration at Fort Selkirk, where the Lewes and Pelly rivers join to form the Yukon. Fort Selkirk is 200 miles up the Yukon from Dawson City. It commands the route of ingress to the territory of the gold district by the rivers named, as well as by the Stewart and MacMillan, and there the protected bank will be established.

The steamer Islander from Skaguay brought 200 passengers a large number of whom lost partners and outfits in the recent dreadful avalanche on the Chilcoot Pass. Dr. L. Goeschel, who assisted in the rescue, said: "I believe at least 125 bodies will be recovered before the work of rescue is complete." Traffic over the trail has been suspended while the search for bodies is in progress. P. F. Greene says twenty-two men of the Chilcoot Transportation Company were caught in the first slide and were returning to Sheep Camp when they were caught and lost their lives in the big one.

The Alaska Exploration Co. has letters written between Feb. 15th and March 1st from L. R. Fulda at Dawson City. He has visited all creeks where the placers are worked, and speaks authoritatively after a close examination. He says that the output of gold for the winter will be large, considering the small force at work, and he predicts that the first boat out will carry a large sum of money. The general estimate at Dawson is that $15,000,000 in gold will be taken out this winter. Claims that sold for $2500 in November were held at from $50,000 to $80,000. He saw eight pans taken from three new holes on claim 6 that panned $139.80. The pay streak had proved to be 2½ feet deep and 100 feet wide. On claim 13 the gravel was paying $46 to the forty-pound pan. The prices asked for claims on Dominion, Gold Bottom and Sulphur were ridiculously high, and could only be had for spot cash. Upper Bonanza was yielding beyond expectations. On Sulphur two men in one day took $237 from claims 5 and 6. On No. 6 on Dominion $139 was brought up in one bucket, and the owners were asking $160,000 for the claim. A half-interest in claim 43 on Hunter sold for $30,000. Stampedes from Dawson were of frequent occurrence and upon the slightest rumor of a strike. Chief Creek had not turned out well, but Nine-Mile creek was the scene of the wildest excitement. The entire creek had been staked, and big prices were being asked for even speculative claims. The scarcity of food had retarded the prospecting of the outlying creeks, and the weather had been very cold, the thermometer falling below 60 degrees.

Provisions and labor were very high. The services of a man and team commanded $75 a day. Candles cost 35 cents apiece, and kerosene $20 a gallon.

Much wildcat property, for which big prices had been paid last fall, had turned out well, and in consequence all claims were held at stiffer figures. Quite a number of owners were doing so well that they would probably draw out if they could sell for a good price. As much as 10 per cent a month was paid by some borrowers for loans on good mining security.

IDAHO.

The Bingham Placer Co. will begin operations at Gibbonsville within twenty days. The same company will resume development of a quartz property in the same neighborhood. ——Extensive hydraulic operations will be carried on near Florence. The property comprises 400 acres. J. C. Meinert & Co. of Florence are the owners.——At Hailey the Golden Star mine has an ore body 13 feet wide that assays $47 per ton.——Mills will be erected this summer on the Tip Top, Capt. Lusk, Supt., and on the Golden Star. The Moscow is developing a ledge of fair-grade ore.——C. H. Bogue has begun work on his hydraulic mine near Warrens.——Work will be resumed on the Checkmate mine at Willow Creek.

The Crœsus and Hope mining properties at Hailey were consolidated last week.——The output of the mines in the Cœur d'Alenes in 1897 was $9,000,000.——The Montana D. Co., that purchased properties at Placerville, has bonded additional acreage and expects to employ 100 men this summer.

Three hydraulic monitors have been added to the Twin Springs mine near Idaho City, making a total of five in operation.——Brown & Reddy of Spokane, in their mine near Hope, contemplate placing a $1500 hoisting engine. Narcoe & Co., near Hailey, are shipping a carload of concentrates a week from the Minnie Moor tailing dump, of which there are about 200,000 tons.

UTAH.

Work has resumed on the Orient mine at West Tintic. The shaft has reached 100 feet. ——At the Savings Bank mine copper ore of good value has been discovered.——The Bertha is making regular shipments.——The Sioux-Ajax tunnel at Mammoth has reached 4300 feet.——At the Undine, near Silver City, drifting is done from the 200 level.——At the Cornucopia a good ore body has been opened. ——The Sunbeam is producing ore of fair value.——In the Martha Washington native silver has been discovered.——The South Swansea at Tintic marketed during the year 4222 tons of ore, from which was derived $103,602.17; the dividends paid were $52,500; the balance on hand is $5,797.28. The property began paying dividends fifteen months ago, since which time it has paid $82,500. The main shaft has reached 724 feet.——The Grand Central M. Co. purchased the Wedgewood and Six Shooter claims for $50,000 cash.

The Niagara Co. at Bingham is marketing 1000 tons of ore per month. The Last Chance mine is crushing 100 tons daily. Ten tons of concentrates are derived, which yield 66 per cent lead and 45 ounces of silver per ton. The company has 200 acres of ground, and the ore bodies are large. The Stewart is being extensively prospected through four tunnels. At the Grizzly mine near Alta there are 100 tons of ore carrying copper and silver. The same amount awaits shipment at the Vallejo.

The output of Grand Central at Provo averages twenty-five tons of ore daily that carries gold, silver, copper and lead.——The Sacramento at Mercur is outputting 100 tons a day. ——Assays from the Rosa return 56 per cent lead and from thirty-two to forty-nine ounces silver per ton.——The total output for March from Bingham is 4097 tons.——At 650 feet depth the Antelope struck a 12-inch streak which is widening in wedge shape and assays 51 per cent lead, twenty-nine ounces silver and $5.25 gold.——The *Tribune* says the Centennial Eureka will erect a new mill with which to prepare its low grade ore for market.——The Marsac mill at Park City will work the Ontario tailings.

The South Swansea shipped six cars of high grade silver and lead ore.——The Mercur people will begin development on their property at Manning.——The Sterling Coal Co.'s tunnel has reached 1600 feet, with 500 additional to be run under present contract.——The Fortune M. Co. at Bingham shipped three cars of ore, in one of which copper predominated. In the others silver and lead were the principal metals.——The Lower Mammoth at Tintic will sink another 100 feet, which will give it 650 feet from the surface.——A strike of ore is reported from the Norway at Eureka.—— The May Day will extend their tunnel 800 feet farther in their Tintic property.——The Ophir Hill Con. Co. contemplates an additional plant to work their crude ore and the accumulated tailings. They calculate the latter to net $3 per ton.——The Geyser-Marion made a $5000 cyanide shipment.——The Mercur made a semi-monthly shipment of cyanides valued at $24,000.——The Columbia M. Co. at Mercur reports a new ore body of good values.——The Mignon at Manning made a strike of good values.

Work will be resumed shortly on the Deer Trail group at Marysvale.——The Sunday claim has developed a body of carbonate ore. ——The shaft on the Rabbit's Foot has reached 300 feet.——At the Four Aces a 6-inch streak of argentiferous lead ore has been discovered.——Assays at the Cornucopia show 190 ounces silver and $16 gold.——A steam hoist is to be erected on the Martha Washington.——The International, at West Tintic, at 250 feet struck a 12-foot ledge of steel galena.——The Dexter made a $2500 cyanide shipment.

The Yuba, at Bingham, discovered a 2-foot ledge of sulphide ore that returns 22 per cent copper, twelve ounces silver and $14 gold per ton.——The Florence M. Co., at White Rocks, struck a ledge that assays $35.20 in gold per ton.

MONTANA.

C. F. Buckley of Kalispe is doing extensive development work on his Yahk claims.—— G. Hathaway is pushing work on his copper claim near Libby.——At Sheridan a mining case, entitled McKay vs. Noble, occupied the attention of the court, the facts of which are as follows: Knight Bros. and associates discovered mineral on the lower end of the ground in controversy Aug. 27th last and put up a location notice to that effect. They did not do the location work at the time. Aug. 28th Noble and partners discovered mineral on the upper end of the disputed ground and dug a cut 10 feet to record the property and set their corner stakes. Later they began work lower down, running a tunnel and crosscutting. Before the time for doing the location work had expired, Knight Bros., who in the meantime had disposed of an interest in the claim to K. McKay, returned to do the work. They found the Noble faction at work and the lawsuit resulted. Fifteen witnesses were examined when Noble's attorneys asked that the jury be excluded from the room, as they wished to argue a point. At the conclusion of the argument the jury was recalled and instructed to find for the defendants, the judge holding that they were in the right, inasmuch as their corners were the first in position.

In the Bonanza mine, at Walkerville, the finding of a large ore body is reported. The property is under bond to the Montana O. P. Co. The strike was made on the 600 level.—— The Sapphire mines at Yogo will be extensively operated this season by hydraulic methods.——The Banner mine, near Argenta, is shipping ore.——The Hecla Con. smelter at Glendale is in operation.——Anderson Bros. of Bozeman contemplate erecting cyanide mills on their low-grade properties near Livingstone.

Another mining suit was instituted in the U. S. Court in Butte by the Anaconda Co. against the Colusa-Parrot Co., owned by W. A. Clark, to enjoin the defendant from following beyond the side lines of its claim, the vein claimed by the Anaconda Co. The suit involves untold values and a Federal question as to which company is entitled to the ore.

An average of six carloads of ore are shipped every week from Norris.——Two and a quarter cars from the Columbus mine yielded $170 per ton.——A shipment from the Galena returned $118 per ton.——In the Louise an ore body was struck that runs upwards of $100 in gold per ton. Judge Duncan, the proprietor, contemplates sinking to 500 feet depth and adding adequate pumping facilities.——Doney & Co. contemplate placing steam hoisting machinery.

SOUTH DAKOTA.

The production of the Wasp No. 2 mine, near Black Hills, last year amounted to $182,000.——H. B. Swain discovered a 4-foot ledge near Preston that assays $30 per ton.——From a five days run at Oreville the St. Elmo cleaned up fifty ounces of amalgam.——The sale of the Ore Cache mining claim, near Deadwood was made by Sheriff Plunkett, to satisfy a judgment on foreclosure in favor of J. H. Carstairs of Philadelphia. The amount of the foreclosure was $95,747.33 and the property was bid in by Mr. Carstairs, as trustee for a Philadelphia company.——Near Two Bit was discovered an ore body that runs 40 per cent lead and $10 in gold.——The shaft on the Deadwood M. & D. Co. has reached 175 feet. The lime shales found in the shaft assay $17.20 per ton and the sand shales $12.80.

MICHIGAN.

E. Roberts has closed a copper deal for a property on the Lake Superior zone about thirty miles from the Calumet & Hecla for $2,500,000.

COLORADO.

The output of the Wolftone at Leadville is 1800 tons of ore per month.——The Lucky Gus at Cripple Creek produces mill ore running two ounces per ton, and a shipping grade that goes ten ounces gold per ton.——The Lafayette, at a depth of 400 feet, cut into a 6-inch seam of ore that yields $35 a ton.——In the Pinto a pocket of sylvanite was found at the 350 level that assayed $1000 per ton.——The Ridgeway at Silverton produces a carload of ore per week that yields $180 per ton.——The Gold King is producing a good grade of ore and making weekly shipments of concentrates.——The M. E. Harrison will be reopened this summer. The mineral is sulphide of lead and copper, carrying some gold and silver.——The Smuggler-Union at Telluride is producing 175 tons of ore per day. The new California canvas tables in use prove satisfactory in saving values from the tailings.—— The Last Chance mine, in Wall St. camp, made a fifty-ton shipment of high-grade ore.

The Lalla Rookh property at Eldora is producing ore that runs from $27 to $40 per ton. ——The Poor Woman mine is in mineral that runs $16 per ton in the stamp mill, while the smelting ore runs from $50 to $100 per ton.—— The Denver *Mining Review* says that Judge Allen of Arapahoe county has dissolved the injunction placed on the Running Lode M. & M. Co., after having been in force for six years. This removes from the records of the county a matter which might have caused considerable litigation, and leaves the English investors who recently purchased the Running Lode group of veins from the old company without any cloud hanging over their title. The company is now in possession of the property and have already commenced preparations for further development work. ——The shipment of smelting ore and concentrates from Black Hawk for March amounted to 350 cars of seventeen tons per car.——Considerable ore is being shipped from Russel district to Idaho Springs.——The Kansas Con. mines in Gilpin county sent to the custom mill at Black Hawk last month 2800 tons of ore.—— The Nellie mine at Telluride has come into new ore and of high grade.——The Gilpin & Cripple Creek G. M. Co. secured under lease the Roanna and Atlanta claims on Bull Hill for eighteen months for $60,000, of which between $5,000 and $10,000 was paid cash. The property comprises nine acres.——At Leadville the Neptune mine is shipping two cars of iron ore daily.——The Boreal is shipping a good grade of silver-iron from the 250 level.——The Gallagher is hoisting eighty tons per day of iron sulphides from the 1150-foot level.——The La Plata is shipping carbonate ore carrying fifteen ounces silver and 25 per cent lead.——The Silver Queen at Lake Park opened a streak of mineral that samples 165 ounces silver, 3½ per cent copper and one-half ounce gold.——During March there were shipped from Creede 700 carloads of ore comprising 11,900 tons.——At Eldora a 2-inch vein of sylvanite was opened in the Liberty Bell.——Uranium is reported to have been discovered near Idaho Springs, and specimens have been forwarded for analysis. ——The net proceeds of the Ridge mine at Creede since last June were $36,000. The ledge is 6 feet wide and consists of good grade pure lead ore.

The annual statement of the Gold Coin Co., one of Gilpin county's chief producers, is out. During 1897 the output of ore was 37,797 tons. Of this 1238 tons was smelting ore, worth $71.81 per ton, and 30,559 was graded as milling ore, averaging $6.51 per ton. The cost of mining reached $5.55 per ton, milling and kindred charges $1.36, mint and smelter deductions 90 cents, making the cost per ton $7.81, which left a net profit of $1.24 per ton. Mill charges ranged from 88 cents to $1.11 per ton. Receipts from ore sold and milled footed up $287,849. Total costs footed up $248,236, leaving $39,613 for net profit. The sum of $10,000 was paid for new property. Following are the details of cost: Breaking ore and tramming, per ton, $2.88; hoisting, 43 cents; general mine account, 17 cents; general expenses, 46 cents; taxes and legal expenses, 14 cents; general repair account, 12 cents; Keystone lease, 1 cent; drainage, 34 cents; prospecting and dead work, $1; total, $5.55.——The Wisconsin at Cripple Creek shipped thirty tons of screenings that returned $50 per ton.——The Legal Tender production for March will reach 2000 tons. Sinking has been resumed at 550 feet.

The Banty mine, near Idaho Springs, at 200 feet depth, struck an ore body in which the smelting streak is said to measure 3 feet.—— The Abe Lincoln at Cripple Creek, on which work was resumed about three months ago, on the 300 level, came into ore measuring from 2 to 4 feet which runs from $80 to $100 per ton.——A new strike was made on the Pharmacist. The first carload consisting of ten tons yielded $50 per ton. There are two feet of ore in the vein.——The output of the Fluorine is from fifteen to twenty tons per day, and runs from $30 to $40 per ton.——At Woodland Park a new strike is reported in the Lacey mine of a 2-foot vein of high-grade ore.——M. Moffat struck a ledge near Cottonwood that measures from 7 to 15 feet and of good grade.——Both the Mollie Gibson and Free Silver pumps have shut down and are under 20 feet of water. The Mollie Gibson took the initiative. When the Smuggler took charge of the pump on the first of the year, it was attempted to form a pumping company to divide the expense of handling the water in the Free Silver, Smuggler, Mollie Gibson, A. J. and Della S. It is claimed that the Mollie Gibson declined to enter such an agreement. The Smuggler declined to handle 1800 gallons of water per minute, thereby draining the Mollie Gibson to 600 gallons per minute, and decided to abandon all workings below the ninth level. Many theories are advanced to explain the action of the Mollie Gibson Co. A short time ago a body of high-grade mineral was uncovered in the thirteenth level of the Mollie Gibson. The strike was kept from the public, and not until the level was under water did the details come out. It is claimed that this ore body is exposed over 400 feet. It has been operated upon 70 feet and crosscut 60 feet, the upraise and crosscut still being in ore. It runs in value from 100 to 460 ounces in silver. In explanation of their action the Mollie Gibson people say that they have decided to concentrate their output, and have sufficient ore for this purpose above the tenth level to keep their mill in operation five or six years.

The El Paso, at Cripple Creek, is shipping twenty tons of ore daily.——The Snoofly shipped fifteen tons which yielded one ounce per ton.——The McKinney is outputting an average of twenty-two tons per day averaging $50 per ton.——The Burch is shipping fifty tons per week. A carload of second grade ore netted $80 per ton whilst the high-grade shipped yielded eleven ounces per ton.——The Hawkins is marketing a car a week that runs $50 per ton.——The production to date of the Santa Rita is about $100,000.——The output of the Gold Coin, at Victor, averages ninety tons per day of $22, netting about $45,000 per month.——The Fluorine lode shipped 4412 tons of average value of $61.20 per ton.

The Lilian-Leland shipped six tons of ore. At 60 feet depth the ore is 12 inches and assays from $60 to $120 per ton.——The Hillside marketed eleven tons that ran from $20 to $360 per ton.——The Moon-Anchor shipped 120 tons of first-grade ore.——The Porcupine shipped one and one-fourth tons of $320 ore and three tons of $265 per ton.——Returns from the last shipment on the Gold Sovereign returned $89 per ton.——Orpha May shipped ten tons that returned $1277, of which three tons ran $290 per ton.——The forty acres embraced in the Hull City placer is being prospected in every direction. No less than twenty-one sets of lessees are sinking and drifting. Ore is being shipped regularly from five shafts. The strike made by Killum Bros. & Ogilvie is one of the best discoveries in the district. At the 122 level the ore chute has been drifted on 50 feet. The vein at this point is 4 feet wide, with a pay streak 18 inches that, with sorting, is good for $50 per ton. A small seam of talc assays in the hundreds. A station for the second level has been started at 165 feet. The output this month will be fully 400 tons that will have a gross value of between $20,000 and $25,000. When the second level is opened the production will be increased. The vein was cut on its dip at the 150-foot point and the ore found to be fully as rich and wide as in the upper level.——The Last Dollar at Cripple Creek last month shipped thirty-two carloads of cyanide ore and twelve cars of smelting grade of a value of $7000 net.——The output of the Doyle last week was 140 tons at $70 per ton. ——Chicago capital secured an option on the Lindsay for $125,000 for ninety days and has begun the placing of machinery for extensive operations.——The Garfield Con. is taking ore from the 300 level which shows an average value of $1000 to the ton.——The Anna J made an output of seventy tons in March divided in

three grades, yielding $300, $80 and the mill rock $30 ——From the three chutes on the Modoc at Victor most of the production runs from $300 to $600 per ton.——The Gold Coin has 3 feet of mineral that runs $60 per ton. The tonnage for April is estimated at 4000. ——At Creede, Wilson & Combs struck a 3-foot vein said to carry 75 per cent lead.

Stockholders of the Boston & Cripple Creek G. M. Co. are called to meet in Cripple Creek, May 17th, to vote on proposition to increase capital stock to $400,000 without increasing number of shares; to increase par value to $2; to make shares assessable; to authorize directors to borrow money and mortgage the property.——The Mollie Gibson at Salida has been bonded to Riggs & Ross for $15,000. Development work under the new ownership is in progress.——N. Esperson has taken a bond on the L. S. Junior for $7500 and is pushing work.——The Little Jack has been leased for $25,000.

ARIZONA.

E S. Campbell has leased the Morning Glory mine and mill near Prescott, and will repair the mill and put men to work in the mine. Oregon capital is interested with Mr. Campbell. The ore is low grade but there is a large body of it.——The Cochise Copper M. Co. at Bisbee has thirteen claims. Eastern capital incorporated a new company which will push development. There are said to be 200,000 tons of ore on the dumps ——The ore chute on the McGilroy mine near Cedar is growing larger and of better grade as work progresses. The depth reached is 175 feet.—— Assays from a new discovery in the Harqua Halas near Mullen's Well show 76 per cent copper. The ledge is said to be 20 feet wide.

The Kingman *Miner* says that the mines of Shirttail mountain are showing large ore bodies and that a large mill must soon be erected in that locality to handle the output. ——The Temple Bar Con. M. Co. is rapidly getting its hydraulic plant on the Colorado river in position.——The bottom of the shaft in the Oro Plata mine is all in ore, and it averages eight ounces in gold ——J. P. Finigan of Chloride has bought the Lone Star mine, and will work the mine thoroughly. The ores of this property in pioneer days were shipped to Swansea for reduction.——T. Johnson sold the Chloride mine for $5000. The property is a lead producer. The *Republican* says that the Mammoth M. Co., operating about seventy miles southeast of Florence, has fifty stamps going. Water is secured on the San Pedro. An extension of the Mammoth is the Mohawk, where there are thirty stamps running. A tramway from the Mammoth to the San Pedro, three miles distant, has been in operation two weeks. The force at the mines and mills is fully 200 men. A stage runs to Tucson ——Seymour & Britton have bonded the Swallow property, comprising eleven claims near Briggs. Three of the claims are considerably developed. Some good ore has been found which is free milling and carries some copper values. The veins are from 3 to 12 inches in thickness and the ore averages $15. Development will be actively continued.——Salt Lake City people have bonded the Leman group. The agreement by which they receive title to the mine is the erecting of a 10 stamp mill and building a wagon road to the mine. They are to give the product of the mine to the extent of $35,000 to the owner, and if they fail to do this within the specified time they lose the mill and the outlay of money for making the road. ——Henry & Ritchie have sixteen claims near Florence, on which they have begun sinking four shafts.

The Gold Bonanza in Pima county is making regular shipments of high-grade ore. The San Xavier is extracting lead and copper ores. The Azurite made a strike on the 200 level of the carrying gold and silver. The Grant group and the Centennial are being developed by Eastern capitalists. The Helmet Peak mines are shipping ore of good values in gold and silver.

The Golden Wonder mine at Payson has 5 feet of ore, 4 feet of which will go $30 and 1 foot will run $100 per ton. The mine has reached a depth of 325 feet.——Concentrates are being shipped from the Grand Prize mine. ——The Arizona Copper Co. will put in another concentrator of 250 tons capacity.——The Birdie claim is producing good ore.——B. F. Steward is developing a claim in the same vicinity with satisfactory results.

LOWER CALIFORNIA.

Californian: The deposits near Ensenada, known as the Valladares placers, will be extensively developed by C. Bennett. Work has already begun. There are five claims, including Gopher hill, on Valladares creek. A large steam pump is to be installed both to drain the creek and furnish water for sluicing. These placers have been worked at intervals for thirty years in a primitive way. This is the first effort to work them by practical and extensive methods.

MEXICO.

At El Oro the shaft in the Mexican mine has reached considerable depth. It is 7 feet in quartz. The ledge is known as the San Rafael, a northern extension of the Esperanza.——The Carmen 30-stamp mill, owned by the Mexican Syndicate Co, is about completed and will be working the first of May. ——The American Mining Co.'s 100-stamp mill, the largest in Mexico, will, it is expected, start the first of July. —The shaft that C. D. Lane is sinking on the America's property is down 100 feet. The hoist and air compressor, together with the drills, etc., are en route to the camp from San Francisco.——The ground for the new hoist and compressor for the Esperanza has been broken, and the machinery is on the ground, and will be in working order in about thirty days. Their new cyanide plant is about finished and will be running within two weeks. This plant has a capacity of 100 tons daily.

WANTED.—Position as Superintendent of Hydraulic, Drift, Gravel or Quartz Mine. Twenty-five years' experience as superintendent of gold, silver and copper properties. Best of references. J. C., Mining and Scientific Press.

WANTED.—A practical mining man, with business ability, thoroughly experienced in mining engineering and the economical working of ores, desires a position as manager or superintendent of a quartz mine. Reasonable salary, and good references. Address "D." this office.

ASSAYER AND ANALYST
Desires position. Now occupies a responsible position. Desires change on account of climate. Address "W. W.," care Mining and Scientific Press.

MANGANESE MINES FOR SALE.
High assay; 30-foot ledge; easily reached; timber, water, etc. For particulars, address J. H. COOK, Potter Valley, Cal.

WANTED.
Position as Manager or Superintendent of Concentrating Mill
By a man of ten years' practical experience in the construction and operation of mills containing all the latest known improved methods of amalgamation and concentration. Address F. J. M., care of Mining and Scientific Press.

Assayer Wanted
FOR CENTRAL ARIZONA,
Who has a button and pulp scale or outfit complete. Single man. Must be able to check against smelters and be thorough. Wages $60 per month, with board and room. Must furnish references as to ability as assayer, also honesty, sobriety, etc. Address ARIZONA, Mining and Scientific Press Office, San Francisco, Cal.

Practical Running of Dynamos.
A little booklet on the Care, and the Locating and Remedying of Troubles in Dynamos and Motors.
PRICE 10 CENTS.
Catalogue B. Mechanical, Electrical and Mining Books sent free.
PHILADELPHIA BOOK CO.,
15 S. Ninth St.....Philadelphia, Pa.

A BARGAIN.
One No. 1 Dodge Pulverizer
(With Challenge Ore Feeder).
Capacity, 20 to 40 tons per day. Weight, 18,000 lbs. This mill is in perfect condition, having been in use but two weeks. Price, $1000. Address "Pulverizer," care Mining and Scientific Press, San Francisco, Cal.

LEVIATHAN BELTING
WHICH FOR **STRENGTH AND TRACTION POWER HAS NO EQUAL.**

Especially Adapted for

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. ✦ ENGINEERS AND MANUFACTURERS OF **Ore Milling and Smelting Equipments.**

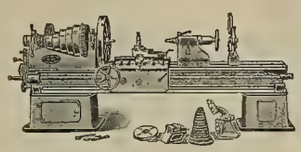
We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.



HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

MINING MACHINERY.

Be Sure You Get
THE GENUINE FRUE VANNER.
SUPERIOR TO ALL IMITATIONS.

You do not know what is best in CRUSHERS unless you have used our

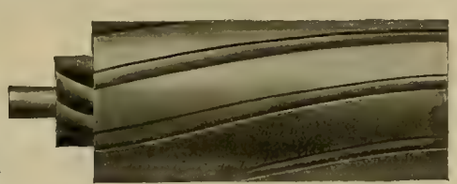
Comet Adjustable.

It is easily in advance of other gyratories, which lack its range of adjustment for wear and change in size of product. Our new heavy design is also superior in proportions to that of any competing machine. Its good qualities are evidenced by largely increased sales and expressions of satisfaction from customers.

Evans Hydraulic Gravel Elevator,

— MANUFACTURED BY —

THE RISDON IRON & LOCOMOTIVE WORKS,



SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made.
It will do more and better work than any other Gravel Elevator.
It is fully protected by United States and Canadian letters patent.
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

See those wires -- how they interlock? Note the smooth surface also. No displacement of wires in any event. Gives three times the service of other cables, and adds correspondingly to the life of the rolling stock.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Assaying Gold .....AND..... Silver Ores.

A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco

Market Reports.

The Markets.

SAN FRANCISCO, April 14, 1898.

The war and the weather occasion a general advance in all prices and a general holding off of purchases, an uneasy combination. Actual declaration of war would further stiffen prices and enliven nearly everything except grain freights. At this writing it is difficult to correctly quote any figures on even staples. War is costly. The Civil War of 1861-65 cost, while it was going on, $2,920,000,000; interest during and since the war to July 1, 1897, $2,664,000,000; pensions since the war—$2,127,000,000; cost of the war to the end of the last fiscal year $7,711,000,000. When that war began there was a total of $150,000,000 gold in the country; there is now about five times that amount.

A New York dispatch says: Lake copper is strong at 12c bid. The Calumet & Hecla has no more copper for sale at 12c. It is intimated that the Calumet & Hecla brand would bring 12¼c for prompt delivery.

Silver is quoted in New York to-day at 56c, London, 26d; San Francisco 56c. New York quotes tin, 14.45; lead 3.67½.

Mining Share Market, Etc.

The Brunswick lode is at last in a fair way to have work resumed thereon. President Leonard of the Comstock Tunnel Co. and the Gould & Curry, Savage, Con. Cal. & Virginia, Best & Belcher, Hale & Norcross, Chollar, and Potosi Companies have come to an agreement which will enable the latter to prospect the Brunswick lode from the Comstock tunnel. They will run a drift along the lode on each side of the tunnel and haul out the ore and waste rock from the mines through the tunnel. This involves a great deal, not only to the Comstock, but, as noticed last week, to the interests of the American Flat and Silver City districts. It was about time that something of the kind was done and the Comstock is to be congratulated on the turn events have taken. So much has been said herein in favor of the project that it is with pleasure this announcement is made.

The Comstock tunnel strikes the Brunswick lode about 1300 feet from the surface, so that development work can begin at that depth; and can of course be carried on much cheaper from the tunnel than from the surface.

The agreement has not been finally accepted by the trustees of the Comstock Tunnel Co. in New York or by the Union Trust Co. of that city, who are trustees for the bondholders; but it is looked upon as settled. The agreement is a very lengthy document; but the salient points are as outlined above.

As foreshadowed in last week's issue, the supreme court decision in the Hale & Norcross case was handed down last Saturday. It in part sustains the decision of Judge Hebbard of the superior court, some time ago, for a judgment of $210,000 in favor of M. W. Fox et al., with interest from May 26th, '92, making a total of $321,200. Regarding the judgment rendered by Judge Hebbard for $417,600, with interest, aggregating $627,600, for alleged frauds in milling operations, the supreme court orders a new trial and instructs the lower court to proceed not on the assumption of fraud, but in accordance with a rule and public policy which declares illegal, contracts made by trustees with themselves whereby they derive benefit. The result of the decision was, of course, weak prices throughout, which prevailed until Wednesday, when there was a slight improvement.

The Pacific Tank Company.

Owing to the increasing demand for the "patent non-shrinking" tanks built by the above-named company, it has been found necessary to establish another factory at San Pedro in addition to the large plant now operating in this city. The new factory has wharfage and direct railroad connections, which will add greatly to economy and facility in handling the southern trade. This company has built up a great business in these tanks within the past few years, as they have been found to stand the severe dry climate test, and have proved to be the best and most practical tank made. A specialty is being made of mining and cyanide tanks, also silos, as well as the only wooden tank that can be used exclusively for crude or rectified oil. In connection with the new works at San Pedro, the company has an office and warehouse at No. 348 Second St., Los Angeles. The San Francisco office is at 38 Beale street. Circulars descriptive of the tanks will be sent from either office. *

THE HEDGE GOLD EXTRACTOR, for Quartz Mill Work. A machine at last that takes the place of the apron plates in quartz mills, and will make a saving of 10 to 50 per cent over any other process. Simplicity of construction and operation. Large amalgamating surface and a complete and perfect contact. No scouring; no loss of quicksilver. Can easily be kept clean and in order. Durable, practical and economical. Built in three sizes. Price $150, $300, $400. Capacity 4, 10, 20 tons per 24 hours. Weight 175 lbs, 450 lbs, 600 lbs. PACIFIC MINING MACHINERY CO., 127 First St., S. F., Cal.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $5,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

No. 1972.—VOLUME LXXVI. Number 17. SAN FRANCISCO, SATURDAY, APRIL 23, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A California Gold Mine.

From the Mining Resources of Calaveras Co., Cal., is taken some notes on the working of the Gwin mine, and, incidentally, the general condition of the gold mining industry in that region. The article referred to is conservative and contains much practical information. It is worthy of note as a prefatory statement that the method of treating gold sulphurets by chlorination, which is simply the discovery of the chemical affinity of chlorine gas for gold, was first successfully tried at the Gwin mine, Calaveras Co., Cal. This mine is chosen as illustrative of what intelligent work and investment of considerable capital by California miners will do in making a valuable property out of what had been abandoned and believed to have been "worked out."

THE GWIN MINE HOIST.

The Gwin mine was one of the first quartz gold mines to be opened up in California. Some miners in 1850 having found the surface pay croppings of the Gwin mine, were joined by a few others, and the shaft was sunk 200 feet on the incline of the vein. The method of reclaiming the gold in the sulphurets not being known, the values obtained were entirely from the free gold and the sulphurets went to waste. Dr. Gwin, one of California's first Senators, took hold of the mine about that time, and a water power hoist was put in, with a capacity to sink 1000 feet. Messrs. Deetkin and Garland also introduced the Plattner chlorination process a little later, to treat the sulphurets, which enabled them to work the low grade ores successfully. Even then it was impossible to obtain a profit on any ore not assaying $6 or $8 per ton, although the mill capacity had been increased to handle large quantities of quartz. Very rich ore in streaks was taken out from time to time, but as the mine reached a depth of 1350 feet, the necessity of more effective material became apparent. The management, however, went on taking out such ore as could be made to pay. All the high grade ore in sight was mined, and the mine was thus "gutted out." As the shaft reached greater depths, the water increased. The pumps and buckets were of insufficient capacity. The drifts had been run about 1200 feet north and about 100 feet south, and the mine was allowed to fill up with water. The drop in value of all California gold properties took place at that time, and the owners could not get the means required to reopen it. A little later forest fires devastated the vicinity, and in 1894, when the present company took hold of it, a deserted log cabin here and there, or a coil of rusty rope, with bundles of old iron and steel, scattered down the gulch, were the only traces of former activity.

INTERIOR OF GWIN MILL CONCENTRATING PLANT.

Believing in the permanency of the lode in depth, and knowing of the actual existence of large quantities of low grade ore in the upper levels of the mine, Supt. F. F. Thomas conceived the plan of bonding the

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Gwin Mine Hoist; Interior of Gwin Mill Concentrating Plant, 437. Foundation and Water Power of Gwin Forty-Stamp Mill; A Trestle on the Compressor Line—Gwin Mine, 440.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 445-46.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 458.
MISCELLANEOUS.—Treatment of Slimes; Purification of the Electrolyte in Copper Refining, 441. Pumping for Irrigation; Some New Blacksmithing; The Worst of the Dry Years Since 1850, 442. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Commercial Paragraphs, 443. Some Notes on Sulphur and Sulphur Products; An Interesting Showing; The London Mine Promoter, 444.

THE Western Federation of Miners say that at their annual convention in Salt Lake City, Utah, next month, they will proffer the President 10,000 men on condition that they be assigned active duty and sent to the front.

WAR between the two chief copper-producing countries—the United States and Spain—on top of the great electrical demand will occasion a "boom" in the price. Under present ordinary conditions, not even gold mining is so uniformly profitable. The Rio Tinto Co. of Spain announces a forty per cent dividend for 1897.

AT a meeting of the directors of the Fauvel Gold Recovery Co., in London, March 29th, C. J. Fauvel asserted that his process was a commercial success, that in his furnace he could roast ore in eighteen seconds, and that he had "control of the gold mining industry of the world." He also stated that his furnace burned "2½ tons fuel in 24 hours and about 3 tons of water," which seems to be a good deal of water. He also volunteered the information, "when we send a plant out we shall say 'keep your furnace up to 1400 degrees,' and you will get results of 90 or 95 per cent of the gold from your ore." A full description of this process was published in this journal in the issue of Jan. 4, 1896.

THE Virginia, Nevada, *Enterprise*, pointing out that prospectors are likely to help fight Spain, suggests the enactment by Congress of a law providing that in case any locator of a mineral claim should join the army, that fact would relieve him of the obligation to do his annual assessment on his mining claims during the year in which he might serve as a soldier. On the 20th inst., Senator Shoup of Ihaho introduced in the Senate a bill providing protection for miners who may want to go to the front in the volunteer army. The measure sets forth the provision of the present mining laws under which any claim on which assessment work amounting to $100 has not been performed each year shall be subject to forfeiture, and then makes an amendment to the effect that in no case shall there be a forfeiture where the miner was serving any part of the year in the army as a volunteer.

THE recent visit of Dr. Day, Chief of the Mining Bureau of the U. S. Geological Survey, to California, may result in securing a mineral exhibit by this State at the Omaha Exposition. Dr Day's plan is an excellent one and deserves more hearty co-operation than it has received. It was virtually decided last month by those who had the matter in charge that nothing in the way of mineral exhibit would be done by this State at the Transmississippi Exposition. Since then three commissioners, De Young, Ford and Yale have been appointed to take charge, and a present effort is being made to at least secure the transmission of the mineral exhibit of the California State Mining Bureau, which is now being boxed up prior to its removal to the new Union depot. At this writing it is understood that nothing is needed but the consent of the Governor of the State to secure the shipment of that fine exhibit to the Nebraska city for exhibition of California's mineral wealth. It would be a mistake every way to permit such an opportunity to go unembraced. The Commissioners referred to desire to announce that any ores, building stone, mineral specimens, etc., sent to them will be forwarded to Omaha. All such specimens intended for exhibit should be sent to the State Mining Bureau, 24 Fourth St., San Francisco.

CARE is necessary on the part of prospectors and mine locators in making their locations to ascertain as closely as possible the strike of the vein and to place their posts accordingly. To simply find a few outcroppings, upturn a little, sight along by eye measurement, make a sort of a decision which way the vein strikes, and then locate and record, does not always do; for very often, after considerable time and effort, the locator is likely to find that the vein has reached out of his side boundaries one way or the other, or is very close to one of them, instead of about the middle of the 600 feet as he supposed. This may do until the property becomes valuable, when results the inevitable lawsuit to decide side lines, or extra lateral rights and all that, which can be usually avoided by some intelligent work in the beginning. Some time ago the Supreme Court of Colorado, in the case of the Smuggler vs. the Fulton and M. claims, decided to the effect that a claimant had no right to follow his vein or its dip outside of the side lines, unless the vein passed out of both end lines; thus giving an illustration of why prospectors and locators should be careful about locating as closely as possible along the strike of the vein, even if it involves the sinking of a few prospect shafts, for the expense may after all prove an economical measure. Then, before recording, it is well to have the side lines closely approximated. Quite recently a suit involving a similar question was tried at Virginia City, Montana. The plaintiffs proved that the posting of the notice of location was in the usual form; but they described the course of the lode as "northerly and southerly," while it came out in the evidence that the true direction of the line was about northwest and southwest. After they had posted their notice they left their claim temporarily, returning after six weeks; but during their absence the defendants in the suit referred to had made a location in that vicinity, running a line due north, which conflicted with the plaintiffs' location. The plaintiffs had, before the expiration of the ninety days required in Montana for the setting of posts, sunk their shaft, established their corners and recorded their declaratory statement. Their counsel maintained that the location notices should be liberally construed, and that as the statute required the "general course of the lode as near as may be," the term "north" would protect a location made northwesterly. The defendants' counsel maintained that those terms north and south should be strictly construed, in which the court agreed and held that the the locator was bound strictly by his location notices, finding for the defendant. While it is believed that the justice of the case lay with the plaintiffs, nevertheless strict technical construction gave the defendants the legal rights in the matter. This decision indicates the necessity for the locator to be sure of his bearings, or else be definite about the setting of his corner posts or notices. It will not do for him, in Montana, to take ninety days after posting his notice to mark his corners. As usual, the case will be appealed. The Montana State law gives the prospector ninety days to set his corner posts, define his boundaries and sink a 10-foot shaft, the idea being to give the locator some time to determine the trend of the vein, that he may properly place his end lines and protect his extra lateral rights, as it is manifestly impossible to determine the exact direction of the vein until the property has been developed to a certain extent, but under this recent Montana decision the prospector has no protection unless he places his corner posts immediately upon making discovery or location. Thus he seems to have to take his chances immediately, and if he finds himself wrong he is liable to lose his holdings should his side line be shown to be the end lines, that is, unless he has sufficient money and patience to take the case to the Supreme Court of the United States. The matter is referred to simply to illustrate the necessity of care on the part of the prospector or locator, to be as exact as possible and to give as little opportunity as can be given for litigation, which is always vexatious and expensive.

OBJECTION is made in an exchange to the alleged tyranny of an employer in a certain instance discharging an employe, whose personal habits outside of his work and working hours were not satisfactory, and the deduction drawn therefrom that the employer had no business to make such unwarranted decision; that what a man did outside of his official hours was his own business and nobody else's; that it is nobody's business what an employe does, provided he does a day's work for the man or men whose pay he accepts while on duty; but still, it may be said, that the employe may act in such a manner as to invalidate his own worth. Strictly speaking, the employe lost his position not for what he had done when off duty, but because he was of lessened use to his employer while on duty. An employe usually understands what he can or cannot do with due regard to his bodily, mental or moral efficiency. For instance: The ordinary man or woman may not be as sensitive as an imaginative child, that will lie awake in horror after hearing or reading a ghost story. Nevertheless, the man or woman so constituted would probably find it necessary to either give up his or her job or else quit reading ghost stories at midnight. It is not at all likely that a man or woman would be consulted as to his or her literary tastes in the matter; but would be removed because he or she could not render the necessary aid, and would be succeeded by some one who could do so. A man working in a mine, or an engineer at the hoist, has a right, so far as he is individually concerned, to get drunk any time that he is not on duty; nevertheless, probably the man who went down in the cage would object to the engineer in charge if he knew that that employe had been up all night in a drinking resort; or he might feel a little hesitation about going to put in a hole or put off a blast with a fellow workman who had been too convivial the evening before and hadn't got over it. Everyone who has attained years of discretion has a right to his own opinion; still it is believed that it would be unwise for a bank cashier or a trusty bookkeeper to be frequently seen with a man who had been convicted of theft. It is just possible he would lose his situation. Were any member, for instance, of a labor organization known to be dishonest, there might not be any motion made for his expulsion; but nevertheless the other members of the union would not care to consider him as a candidate for the treasurership. There are certain unwritten laws in this world which will remain unwritten, because it is supposed that the average man will have common sense, and it is impossible to lay down rules. It is absurd to assume that a mine manager or any other class of employers wants to exercise any despotism over the employes or anybody else. The whole fact of the matter is that a man who is not qualified will always find a better qualified man who is ready to take his place.

CO OPERATIVE MINING, rightly conducted, is a paying proposition. Men earning a little more than their daily requirements and wanting to have their surplus money produce them more than the ordinary savings bank investment, can get together to the number of ten or fifteen, each paying a settled amount weekly into a common fund for prospecting. The main point is to be sure of their man, for the strength of a venture of this kind depends upon the ability and reliability of the prospector who spends the money. When he has a good prospect, a little more than the first quota will be required to develop it. In this development expensive machinery is not to be thought of at first; mining machinery men now make small stamp mills that are economical and effective; two, three and sometimes five heavy rapid-drop stamps, discharging on three sides, are in this

regard found satisfactory. In case extensive development or purchase of expensive machinery is deemed necessary, when that point is reached is a good time to get expert opinion, for then begins the manufacture of a mine, which is as important as its discovery, and the question arises whether it is best to sell or bond, or for the co-operators to make their own developments. Of course such an investment as that indicated needs close watching. Though confidence be at the bottom of it, nevertheless it would not do to take too much for granted, and each one interested must have immediate knowledge of just what is being done. Many a fine property has been discovered and developed by just such small beginnings, the same rules being required in this as in any other legitimate business, the advantage in mining investments being that there is no more gamble about it than any other business, and where successful it is unusually satisfactory. Where such a scheme is pushed it is often easy to find a buyer, with the joint stipulation that all the money is to be used for developing, the original owners retaining certain interests—that is, they would part with a portion of their holdings for the sake of having the property developed, on the proposition that without such additional capital they could not go ahead and that it would be better to own one-third of a developed mine than three-thirds of a prospect, as an undeveloped mineral location is probably the most unproductive form of real estate that one can possess. There is much in the mutual plan to commend itself to the judgment and action of small capitalists.

Defining Hydraulic Mining.

The news published herein last week of the ruling or decision of the California Debris Commission, giving their interpretation of hydraulic mining, has naturally occasioned great interest in every district affected thereby. In this regard it is considered timely to publish the following, being extracts from a letter written eleven months ago by T. L. Ford of San Francisco to an inquirer regarding the discussion then going on before and by the Debris Commission as to what constituted hydraulic mining:

The Caminetti Act was approved March 1, 1893. It placed one class of mining, namely, "hydraulic mining," under the jurisdiction and control of the California Debris Commission, prescribing rules and regulations for the carrying on of that particular branch of mining. The Act specially limited the jurisdiction of the Commission to hydraulic mining, thus excluding all other kinds of mining from the Act. As you know, there are many kinds or classes of mining well understood and recognized in this State. Among the more familiar classes are "ground sluicing" etc., etc., to which must be added the equally familiar and distinctly recognized method or class known as "hydraulic mining." Thus you will note that the Commission has nothing to do with quartz mining, river mining, drift mining, working of tailings, ground sluicing, or any other class, kind or method of mining save hydraulic mining alone. The Act nowhere specifically defines hydraulic mining but does declare that "hydraulic mining" and "mining by the hydraulic process" be construed to have the meaning given to these terms in California.

I am not advised as to what argument was advanced before the Commission in relation to the question suggested in your letter, but I do know that the ordinary rules of statutory construction must govern. By the proper application of such rules it ought not be difficult to ascertain the limits of the field in which the Commission is authorized to act.

Rules of Statutory Construction.—Words in a statute are to be construed by reference to the subject matter of the enactment. Technical words, when used in referring to a technical subject, are to be given the meaning which they have when applied to the particular business, art, or science with reference to which they are used, that is to say, their technical meaning. A statute is to be interpreted in accordance with the meaning of its words at the time of its passage. The history of the times and the purposes sought to be accomplished are proper matters for consideration.

Application of Foregoing Rules.—The problem is to ascertain what was the meaning of the term "hydraulic mining" on the first day of March, 1893, as that term was then used and understood in California.

We know that the particular method of mining known as "hydraulic mining" was invented and perfected in California and was thence introduced into other gold-producing countries, notably Australia. We know that hydraulic mining, as understood by the miners of California, is a distinct method, class, or species of mining; and we further know that it was this distinct method, class, or species of mining that Congress had in mind when passing the Caminetti Act. The motives that governed Congress in thus limiting the jurisdiction of the Commission to this one particular class of mining are not far to seek. It was a new field for Federal legislation and Federal control. New duties of a somewhat experimental character were to be imposed upon United States engineers. They were to license, supervise, and control the conduct of a private business. Necessarily some limitation of this novel duty was necessary. This limitation was the logical outcome of the mutual concessions made by the miners and the farmers, respectively. The warfare between the two sections had been long, bitter, and expensive. In January, 1892, the two sections came together at the initial meeting of the California Miners' Association, and a desire for harmony was manifested and mutual concessions proffered. The valley people disclaimed any desire or intention to interfere with any kind or character of mining save hydraulic mining alone. Let this character of mining be stopped or rendered harmless, and they would be content. The miners accepted the plan or proposition thus advanced, and, jointly with representatives of the valley, urged upon Congress the enactment of such legislation as would regulate and control the branch or class of mining complained of by the people of the valley. Thus the attention of Congress was directed specifically to hydraulic mining, and thus it was that the jurisdiction of the United States engineers was limited to that class of mining by the Act that resulted from the facts above stated.

Question.—What is "hydraulic mining" as that term was understood in California on March 1, 1893, the date of the passage of the Caminetti Act?

Generally.—The Standard dictionary thus defines "hydraulic mining:" "A method of mining in which a bank of gold-bearing earth or gravel is washed away by a powerful jet of water and carried into sluices, where the gold separates from the earth by its specific gravity."

The Century dictionary, in its definition of "hydraulic mining," uses the following language: "The essential feature of the method is that the gravel is broken up and washed down into the head of the sluice by one or more powerful jets of water, thrown upon the bank and used in such a way as to furnish a current of sufficient velocity to carry the debris down into the sluice."

The U. S. engineers appointed under the act of Oct. 1, 1888, commonly known as the Biggs Act, thus define "hydraulic mining" in their report to the chief of engineers: "The excavating and moving of the auriferous earths by heavy streams of water under pressure, and conveying the same through sluices to the dumps."

Thus we see that hydraulic mining involves several properties, or qualifications:

1. It is mining by means of the application of water. This, however, is true of all gold mining in this State, so we must seek for some further distinguishing feature.

2. The water must be applied under pressure, and, of necessity, through a nozzle. But this is equally true of various other kinds of mining, as, for example, "drift mining," where the gravel is run out in cars through tunnels to a common dump or place of temporary deposit where the water is applied under pressure and through a nozzle precisely as in hydraulic mining.

3. The water must be applied against "a bank of gold-bearing earth," as stated in the Standard dictionary; or "thrown upon the bank," as stated in the Century dictionary; or, as stated in the U. S. Engineer's report, the water must be used in "excavating and moving the auriferous earths."

That against which the water is applied, then, would seem to be the distinguishing feature and the controlling factor in determining what is and what is not hydraulic mining.

The water must be applied against a "bank" for the purpose of "excavating and removing the auriferous earths" say the authorities above quoted. But what kind of a "bank" must be thus attacked? Of course, there are many kinds of banks that would not fulfill the necessary requirements, as, for example, a bank of gravel taken from a drift mine, a bank of tailings collected from former mining operations, and the like. The fact is that in this State, the bank to be attacked is well understood to be a natural bank and not a bank of gravel or tailings artificially collected or deposited. The fact is so well understood in this State that when the State Legislature came to lay down the rules that should govern the business of hydraulic mining it was expressly declared that hydraulic mining was "mining by means of the application of water, under pressure, through a nozzle, against a natural bank."

It is worthy of note that the definition thus given of hydraulic mining by the State Legislature is contained in an Act that was pending in the State Legislature at the very time of the passage and approval of the Caminetti Act, and which became a law through executive approval on March 24, 1893, but twenty-two days after the passage and approval of the Caminetti Act. The State Act would, therefore, seem to furnish a definition of the term "hydraulic mining" as understood in California cotemporaneously with the passage of the Caminetti Act.

There can be no question but that the State Act above referred to accurately states the true technical meaning of the term "hydraulic mining" as the same was understood in California both before and since, as well as at the time of, the passage and approval of the Caminetti Act. Such will be found to be the universal and concurrent opinion of those whose knowledge and experience entitle them to speak with authority upon the subject.

If any further evidence be needed upon this point, it may be found at page 48 of Vol. II of the American Supplement to the Encyclopedia Britannica, where the following full, clear and correct definition will be found:

"Hydraulic mining consists in the plan of breaking down and disintegrating the banks of auriferous gravel as they stand in place, by means of water discharged against the same in large quantity and under pressure, this gravel being afterwards carried by the released water into sluices furnished with riffles and other appliances for catching and retaining the gold."

Thus we see that the banks as "they stand in place" are the kind of banks against which the water is directed in "hydraulic mining." The words "in place" constitute a well known mining term, and, when applied to rock, gravel or other substance, indicate that the same is where it was placed or left by nature as distinguished from any artificial arrangement, location, or deposit, through human agencies. Thus we speak of "rock in place;" this phrase or term being also found in the Federal mining laws, and meaning rock where placed by nature. So a "bank of auriferous gravel as it stands in place" means simply a bank as nature made it, or, as the State statute has it, a "natural bank."

I understand an effort has been made to extract from decisions of the State and Federal courts a definition of hydraulic mining. This, however, must fail, for the sufficient reason that no authoritative definition of the term has yet been given by any court. The nearest approach to it was an incidental remark made by Judge Sawyer in the famous North Bloomfield case. In that case the water used was partly under pressure and partly not under pressure, the latter flowing over the high banks and causing them to cave down. The banks thus attacked were natural banks, and water under pressure was used jointly with the water flowing over the banks. This, Judge Sawyer said, he considered hydraulic mining. The decision of the case, however, in no wise depended upon whether the mining in question was, or was not, hydraulic mining, the decree entered being against the deposit of debris in the streams, regardless of the character of the mining or the process or methods employed.

Before the California Debris Commission, however, an entirely different question is presented. Here the question is not one of inquiry or damage resulting from mining generally, as was the case before Judge Sawyer, but a question of jurisdiction based upon a correct definition of the term "hydraulic mining" as that term was understood in California on the first day of March, 1893.

THE following is stated to be an exact statement of what transpired in a California county this week, and is furnished as illustration of one of the ways that capital is locally deterred from investment in mining property:

A. has a bond on a group of mines at a stipulated sum. He has the signature of the president, secretary and treasurer of the company to the bond. He succeeds in enlisting capital to reopen the properties. B. comes in and offers $25,000 more for the bond than has been agreed upon with A. It is discovered that, in making the bond to A., the signatures of a majority of the stockholders had not yet been obtained, and that consequently, under the laws of California, the bond is invalid. At much expense and delay the original work is rectified with the risk by A. of losing his bond. The deal, however, fell through by reason of the necessarily long delay. B., who caused the trouble, fails, however, to secure the bond proposed by him, and the whole thing is upset.

If correctly understood in this case, the original intermediary was having the bond put in proper legal shape; but in the delay, a neighbor, hearing of the transaction, made such representation regarding what he could do, as to break off all original negotiation and occasion correspondence that ended in nothing. It is asserted to be a case of "knock-out." As understood in California, and not wholly unknown elsewhere, the "knocker-out" is a man who, unable to successfully place mining property in his control, is determined, if he can help it, that no one else in his vicinity shall make a sale, and whenever he hears of any move toward the enlistment of capital in mines, makes such representation or misrepresentation as results in defeat, to the great detriment of the district so unfortunate as to have him for a resident.

A California Gold Mine.

(Continued from page 437.)

land and sinking a vertical shaft 1400 feet through the country slate, and north of the limits of the old workings. The same work had previously been accomplished by Thomas at the Kennedy mine in Amador county. A shaft was sunk there through the comparatively barren belt and struck a body of good ore below. This was an especially bold work to undertake at that time, for the depth of the gold bearing veins, as well as their permanency, was uncertain. Reducing the inclined depth of the shaft of the Kennedy to the vertical, the total depth of the mine reaches 2200 feet, the deepest vertical shaft in the State.

The Gwin Co. erected a complete water power hoisting plant and the shops in the summer of 1894. Sinking was steadily prosecuted for two years, until the 1000-foot level was reached. Drifts were run at the 700 and 1000-foot levels. At the 1000-foot level a well-boring machine was used to sink a prospect hole, in advance of the shaft work and down past the old drift. It encountered the north prolongation of the ore body at 1195 feet. This bore hole was sunk to the 1300-foot (vertical) level and happily just escaped the old drifts enough to ensure safety in sinking the shaft down near them. The shaft was then continued to the 1400-foot level and the work of opening up the ore body began on the 1200, 1300 and 1400 foot levels, where the vein in a great many places was over 20 feet in width of milling rock. As soon as these lower levels had been opened up and the levels connected, the ore was extracted, sent to the surface in large buckets termed "skips," and then run by hand cars into the bin of the 40-stamp mill, which in the meantime had been erected. An engraving of the mill on this page shows foundation, mortar blocks, water pipe and pressure box. The mill is run by water, which also supplies both power and electric light. In the north drift, at the 1400-foot level in the stopes, a rich vein about 2 feet wide, running through the main fissure, was encountered, full of free gold. The writer was present when a piece of quartz filled with free gold was taken out. The piece was about the size of an orange and afterward $2500 worth of gold was extracted from it. But it is not this rich specimen rock that keeps the mill going steadily, but the large bodies of quartz are yielding $3 and upwards per ton. The gold sulphurets now are all utilized. The percentage of these sulphurets is between 2 and 3 per cent and average from $60 to $100 per ton when concentrated.

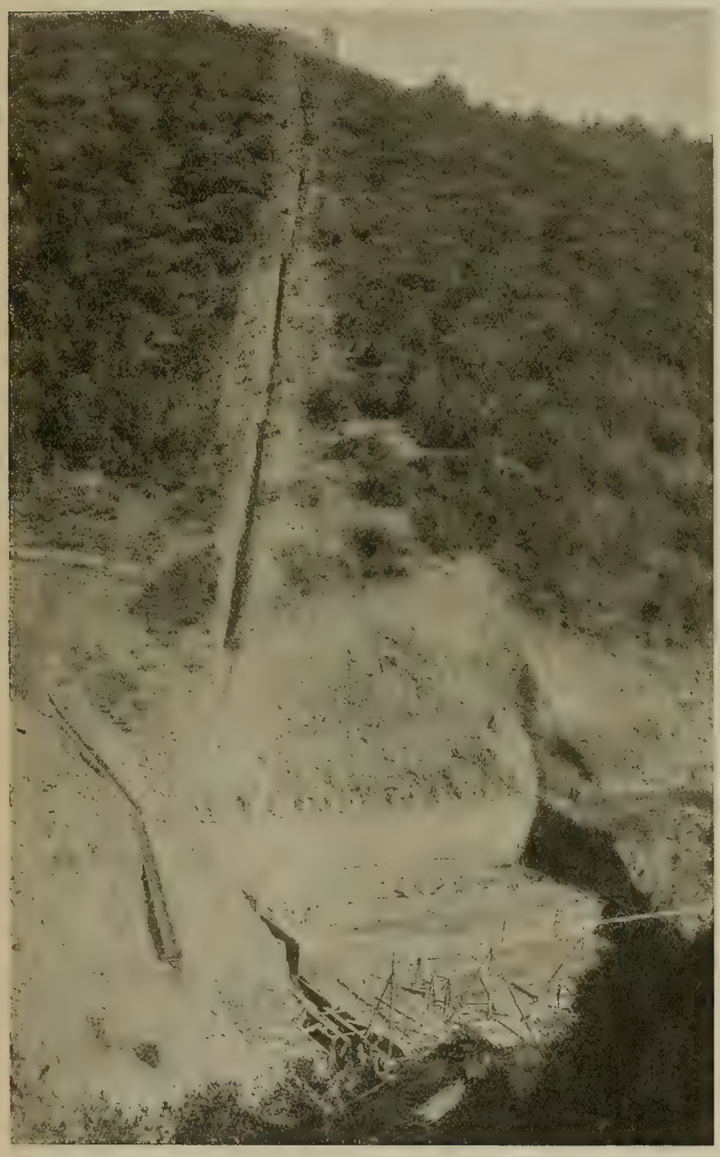
As the south drifts in the 1200 and 1300 levels approached the old workings it became necessary to open them up and drain out the water. Several schemes were thought over, one to tap the old workings by diamond drill holes in the lower levels; but this necessitated compressed air for power. To run such a large hoist under 365 feet pressure, and the mill under 375 feet head, required at least 200 miners' inches of water every twenty-four hours. This was purchased from the Mokelumne Canal Co. at 15 cents per inch per day of twenty-four hours. This water was running to waste, but a plan was devised to put in a settling tank and carry it under pressure in a 15-inch sheet iron pipe 4500 feet to the bank of the Mokelumne river, where 380 feet effective pressure head could be obtained. A large Pelton water wheel, 19 feet in diameter, was then put in, and compressed air enough to readily generate 250 H. P. was obtained. This compressed air was sent back in a 6-inch pipe laid alongside the water pipe, not only to the settling tank, but 1670 feet farther to the old original south shaft. An air receiver was put in there, giving the power to pump out the water from the old shaft. Receivers for the air can be placed at any point where power is needed to perform general hoisting or any other work in the future.

The new 40-stamp mill has been going steadily since January, 1897, grinding out the ore and yielding a monthly dividend satisfactory to the stockholders, for it shows what the mine will do when thoroughly opened up. When the old south shaft is pumped out all the reserves of low-grade ore can be obtained, and, the capacity of the mill as well as the average of the ore being known, the profits can be calculated to a nicety.

Some idea of the extent and value of these ores can be obtained by taking an average section of any one of the mines along the lode, 100 feet in length by 100 feet in height. A rough estimate of this section, taking the average width of the vein at 20 feet, would give 10,000 tons. A 40-stamp mill grinds up 3600 tons of ore a month when running steadily, and this section of loose quartz would be crushed in a little less than three months. Now, take a general average of $5 gross yield per ton, and place the cost of mining and milling at $2.50. The profit on this ore would be $25,000 for the above time. This does not take into account any rich ore found from time to time, that is generally utilized in bringing the gross yield up to its usual standard, when for any reason it may be necessary to shut down the mill. In all of these large mines when the ore is blocked out it is simply a question of the capacity of the stamp mill going at full speed to realize a steady income. The principal mines of the mother lode, at the deep levels, have chutes of ore over 1000 feet in length, with varying widths—from 10 to 40 feet, and even more. It needs very little figuring to show that they will last for years, and while one level is being worked others can be exploited.

With permission of the Supt. of one of the mines mentioned, a statement is given for an average month of last year. During this month 116 men were employed, and the average assay value of ore sent to the mill was $7.50.

DISBURSEMENTS FOR ONE MONTH.



Mine labor	$ 7,833 45
Mill labor	640 00
Mine supplies	755 32
Mill supplies	315 59
Chlorination supplies	390 35
Timber and lumber	3,422 30
Assaying supplies	41 00
Water for power	1,551 75
Wood for power	115 55
Salary of superintendent	400 00
Salary of secretary	100 00
General expenses	67 25
Express charges (sulphurets)	10 50
Express charges "free gold" bar	64 00
Total	$15,707 06

During this month the mill receipts were $26,000, rent, etc., $300, a total of $26,300, leaving a net profit for the month of $10,592.94.

This is only an average report, and when one of these large ore bodies are properly developed, such returns can be regularly obtained steadily for years.

In the wheel-pit of the Gwin mine hoist a pressure of 365 feet is obtained by a total length of 840 feet of 15-inch sheet-iron pipe. The three-compartment vertical shaft, 12 feet by 9 feet in the clear, has been sunk to the 1400-foot level at an average cost of $36 per sinking foot. The hoisting machinery, new 40-stamp mill and all other expenses, except shaft sinking, aggregate $180,000. The air compressor plant (when completed) will probably cost $20,000. The ore is run through a crusher before going to the mill, making the quartz that is to be crushed by the stamps of uniform size. About 350 feet of railroad track connects the hoist and mill. The mine averages 30,000 gallons of water every twenty-four hours, which is readily handled with large skips, dumping automatically. Below the 1400-foot level there is a 40-foot pump, and reservoirs at convenient levels keep back the water accumulating in the drifts. The miners work eight-hour shifts, and their pay averages $2.50 per day. Each shift of men generally excavate about fifty tons of rock. The bin in the upper part of the mill has a capacity of 500 tons. The ore is run through the forty stamps, each of which, when "shod up," weighs 904 pounds and has a 6 to 8-inch drop. The stamps run day and night, and each stamp will crush three tons of ore in twenty-four hours. A 16-mesh screen is placed in front of the stamps and dies, and the pulp is run first on the outside plates, which have a general grade of 1¾ inches to a foot and are each 4 to 6 feet long.

These outside plates retain most of the free gold upon their silver faces. The residue lodges at the base of the screens, where the inside plates are placed. The outside plates are cleaned up every day, and the amalgam of gold and quicksilver squeezed into balls of convenient size to handle, through pieces of drilling or cloth. A few drops of cyanide of potassium and also quicksilver are rubbed on these plates before again replacing them in their proper position. After leaving the plates, the pulp is carried in wooden troughs to large concentrators or vanners, which pan out the sulphurets automatically. After concentration, the sulphurets are

FOUNDATION AND WATER POWER OF GWIN FORTY-STAMP MILL.

A TRESTLE ON THE COMPRESSOR LINE—GWIN MINE.

shipped to the chlorination plant to be roasted and the gold reclaimed from them. There are two concentrators for each 5-stamp battery at the Gwin mill.

At the end of each month there is a general clean-up of all the pulp in and around the stamp and dies. This pulp is placed in a barrel with some mercury, and revolved until the mercury has thoroughly penetrated the mass. The amalgam is worked down and afterwards treated by a method similar to that used on the plates, until all the amalgam is collected in convenient shape to be retorted. The slimes that leave the mill are assayed from time to time, and if they show value to any extent, are again caught up and run over stationary canvas tables, placed on grades sufficient to allow the slimes to slowly run off. Such treatment is sometimes quite lucrative, and it is not uncommon for some of the mines to sell the privilege of washing these slimes to contractors for over $1500 per month.

The retort house is fitted up with a closed and an open furnace. The former is used to heat the amalgam until the quicksilver is condensed. The vapor passes through a cooling tube until again converted into liquid mercury. In this operation only a very small percentage of the quicksilver is lost. The rough masses of gold left in the retort are then taken out and all melted together in a crucible in the open coke furnace. After a thorough melting, the gold is moulded into bricks and sent to the mint or smelter. An assay of the gold brick is made at the mine office as a check upon the refiner. This rough gold varies, but is generally worth from $16 to $18 per ounce.

The canyon or gulch in which the Gwin mine is situated is very steep and narrow. Recently it became necessary to build a flume from the south shaft down the gulch and under the main dump. This carries the water through the canyon and prevents the dump from caving. This flume is built large enough to carry easily the heavy streams of water rushing down the gulch during the severe winter storms. The air-compressor line is also flumed where it crosses the gulch. Altogether, the work of the company is done thoroughly and is justified by the present encouraging developments.

The Gwin mine is a close corporation, controlled by a few vigorous mining men, who personally overlook the work. They control the entire stock and none of it is on the market, the few shares offered having been subscribed at the time of organization. It is typical of modern ingenuity and skill, and its history is a history of California since the gold discovery.

At the annual meeting of the Gwin M. & D. Co. last week, Supt. Thomas reported that near the north end of the 1400 level a winze struck into 50 feet of ore running from $5 to $6 a ton. The water has been taken out of the old or south shaft to a depth of 1009 feet. The ore available at present is very low grade. During the year the amount of ore worked was 48,180 tons, the net return on which was $168,-823.79 in bullion and $39,963 35 in sulphurets. The election resulted in the choice of M. W. Belshaw, Pres.; E. C. Voorheis, Vice-Pres.; C. C. Eells, F. F. Thomas, D. McClure, additional directors, and J. J. Crawford, Sec.

Treatment of Slimes.

NUMBER III.

The Precipitation of the Gold.—It will be noticed that in the foregoing operations we have reversed the ordinary methods of metallurgy. In every other metallurgical operation, successive concentration is the means by which we finally obtain the metal, for which we are working; but in this case we pursue the opposite course. The final operation of winning the gold takes place from a grade of material worth less per ton than was the material with which we started. We have simply changed the physical condition of the gold from the state of a solid into that of a liquid, and it is with this diluted liquid that we have now to deal. Precipitations of metals from solutions present many curious and interesting problems, and one of these is that with the same reagents it is very much more difficult to produce perfect precipitation from a very dilute solution than from a concentrated solution. There are certain chemical and physical laws in connection with this question which I do not think are very well understood. For instance, in precipitating gold from a solution of its chloride by means of ferrous sulphate, a fairly rich solution containing one to four ounces of gold to the ton admits of a very perfect precipitation, if sufficient time is given for settlement, more especially when there are few other metallic salts in solution. A similar solution, but containing only one or two dwts. to the ton, allows of very imperfect precipitation, by ferrous sulphate. This is only one of many illustrations that could be brought forward in connection with chemical precipitation, wherein the results obtained differ widely from what might be expected. In electrolytic precipitation we have a different set of laws governing the electro-deposition of metals from those which operate in chemical precipitation. In the course of our experiment on the precipitation of dilute cyanide liquors we have tried many methods of precipitation solutions containing six to twelve grains of gold per ton, but failed completely with such dilute liquor; whereas the same methods acted perfectly on five dwts. or ten dwts. solution. With a dilution of gold down to six dwts. per ton, which is about one part in 100,000, it would be natural to think if it was one part in 100,000, or one part in a 1,000,000, or one part in 10,000,000, there would not be very great difference in the resistance of such very minute proportions of dissolved gold to precipitation, whether by electro-motive force or by chemical reaction; but the difference between the action of a liquid containing six dwts. per ton and one carrying six grains per ton is most marked, both in chemical precipitation and in electrolytic deposition. In general we have found that we could effect the precipitation of gold in these dilute solutions best, and most economically, by means of electrolysis. We have found that we are more independent in this method of dilution of the gold, and that varying chemical constituents do not have to be looked after quite so closely. It is independent of the amount of cyanide contained in in the liquor, and precipitation takes place whether the solution is alkaline or acid.

The principal points in electrolytic precipitation that it is desirable to study are the amount of current per square foot of anode and cathode, and the time the current is exerted, taken in conjunction with the value of the solution. One of the first points requisite in the electrolytic deposition of gold is that the liquor shall contain no solid matter; that is to say, that it shall be absolutely clear. Otherwise, the great surface which is presented by the cathodes and anodes serves to collect all the fine particles that remain in the liquor; necessarily settlement of any kind upon the metallic surface of the anode or cathode increases the resistance of the precipitating box and results in imperfect adhesion of the particles of the gold to the cathode. This difficulty is easily overcome by passing the liquid before precipitation through a sand filter, or through an intermediate settling vat of large capacity. An example of a good filtering device may be seen at the Central Works of the Rand Central Ore Reduction Company, or at the Simmer and Jack slimes plant; also one of large settling capacity may be seen at the Geldenhuis Estate. The liquid which is drawn from fresh slimes is much more readily clarified than the liquid drawn from accumulated slimes. The liquor from accumulated slimes contains a considerable amount of iron and lime salts in solution, and the settlement of the fine clayey particles is retarded. This may possibly also be due to the organic matter which it contains.

Other substances in the liquid which affect the surface of the cathode are those salts which are in solution upon entering the box and are there deposited on the large surface exposed, or are electrolyzed. Lime which has been used for settlement, and also to neutralize acidity, is in the form of carbonate of lime, sulphate of lime, and hydrate of lime. This precipitates partly as carbonate and partly as sulphate upon the cathodes and anodes, more especially on the former, and, to my mind, is precipitated partly by means of the electrolytic current. Then there are the products of the decomposition of the solution itself, which (in the case of iron salts, resulting from the decomposition of the pyrites in the ore) are separated in the form of Prussian blue and hydrate of iron. Then, again, there are the products of the decomposition of the anode plates.

The clearness of the solution depends largely upon the solution of the anode. The iron plate anode in use to-day in the Siemens and Halske boxes, with properly proportioned current, is a very perfect anode, easy to be obtained in any quantity, and as easily manipulated and secured in the boxes. With a current density as low as 0.03 or 0.04 amperes per square foot, very little decomposition of the iron anode takes place. An anode three-sixteenths of an inch in thickness and with a current density of 0.035 amperes per square foot should last for five years and possibly much longer. There seems to be a limit of current density up to which an iron anode will show very little corrosion, but beyond that point oxidation seems to take the place more rapidly than the proportionate rise of current density would indicate. Where the division and tension of the currents has been very carefully studied and regulated very little decomposition of the anode need take place.

With the peroxide of lead anode which was discovered by Mr. Emile Andreoli in the early part of 1895, practically no corrosion of the anode plate takes place, and although up to now this anode has only been used in a small way, I feel confident that its introduction into this country on a large scale would prove satisfactory. With perfectly filtered solutions and with peroxide of lead anode, working with fresh slimes, and by watching carefully the amount of lime added to the slimes, there should be very little trouble in maintaining a perfectly clean anode surface for the planting of the gold. One point worthy of study by all chemists in connection with the maintenance of a clean anode surface is to see either how the lime salts can be prevented from precipitating in the boxes, or if any economical method could be devised to reduce the amount in solution. I think it is next to impossible to find any substance that would economically replace lime in the settlement of slimes, but some means might be found to obviate its deposition from the solution in the precipitation boxes. The subject of the production of suitable anodes for precipitation of gold from cyanide solutions is probably not exhausted, but the field has been very thoroughly explored by able electricians and chemists, and, beyond the two anodes mentioned, I do not know of any that will fulfill the required conditions.

(*To be Continued.*)

Purification of the Electrolyte in Copper Refining.*

The systematic control of the composition of an electrolyte for copper refining is requisite, to avoid the deposition of foreign metals at the cathode whereby the quality of the copper would be impaired, and to maintain the strength of the electrolyte at its proper point. The copper content of the electrolyte tends to increase, because the copper at the anode dissolves rather more quickly than it would if its rate of dissolution were strictly proportional to the current. This is due to the fact that copper exposed to the joint action of air and sulphuric acid slowly dissolves, irrespective of its function as an anode; copper containing oxide will, of course, dissolve faster than the metal free from this body and dependent for its oxidation on the presence of atmospheric oxygen. The proportion of copper thus dissolved to the quantity of copper dissolved electrolytically will be greater the smaller the current density and the more vigorous the circulation and consequent aeration of the electrolyte. Spontaneous evaporation—not to be neglected when the electrolyte is used slightly warm, e. g., at 30° C. to 40° C. = 86° F. to 104° F.—also tends to increase the concentration of the electrolyte, and thus it comes about that there is a continual tendency for the quantity of copper sulphate in the tanks to augment until an elimination of a portion of it is a necessity. It is evident from this that the purification of the electrolyte should be accompanied by a withdrawal of a portion of its main constituent, copper sulphate.

At the copper refinery of the Baltimore Copper Co. about one-fifth of the electrolyte is removed from time to time to be worked up for copper sulphate, and a suitable (but not necessarily equal) amount of pure copper sulphate solution is added, so that the content of the electrolyte in impurities is diminished, and, at the same time, the strength of the electrolyte in copper sulphate is adjusted to its normal value. The importance of this regulation lies in the fact that in a large refinery containing a multitude of small units of plant it is essential for smooth working that the conditions of current density, resistance of solution and the like should be maintained as nearly uniform as possible. It is for this reason that any process of purification which would regenerate the electrolyte continuously, instead of periodically, would present many advantages.

Using this method, the Baltimore Copper Co. produce a considerable quantity of copper sulphate, which is sold with profit to the Western Union Telegraph Co. The final liquors are precipitated with iron scrap to recover the last portion of copper, amounting to 2 or 3 per cent.

At the works of Guggenheim Bros., Perth Amboy, N. J., the liquor is run into lead-lined vats and boiled with scrap copper with free access of air, so that the copper may be dissolved, the free acid neutralized, and the solution so enriched in copper sulphate that it can be readily crystallized to yield this salt. The copper sulphate is deposited on lead strips hung across the crystallizing tank. The mother liquor contains almost the whole of the antimony and arsenic, together with a small quantity of copper. The latter is precipitated by iron plates, on which the arsenic is also deposited as soon as the copper has been thrown down. Ultimately a black precipitate, containing as much as 60 per cent of arsenic, is obtained. This may be worked up either for crude copper or for the production of arsenic compounds, such as Scheele's green, paris green and white arsenic. In the Chicago Copper Refinery the bulk of the copper sulphate is recovered by crystallization, and the mother liquor is boiled down to a point at which both copper sulphate and arsenious acid crystallize out. The mixture is extracted with just enough water to dissolve the copper sulphate, which, being thus fairly freed from arsenic, is returned to the vats.

In the foregoing cases a part of the whole of the electrolyte is worked up for copper sulphate, and this purified recovered salt is returned to the process. Other methods have been proposed for the direct elimination of the chief impurities in the electrolyte and its restoration to a proper working condition without recourse to crystallization of the whole quantity of copper sulphate. These include boiling the liquor with metastannic acid to precipitate arsenic, filtration of the liquor through a layer of cuprous oxide, which is a base strong enough to precipitate most foreign metals as hydroxides, and oxidation of some of the impurities, notably iron, by aeration, and constant precipitation of certain other impurities, e. g., arsenic as ferric arseniate. All these methods, singly and conjointly, have met with

*Condensed from the London Electrician.

very poor success. Purification by means of tin added to the copper before it is cast into anodes, in the proportion of 2.5 pounds per ton (say, 0.1 per cent), has also proved of only moderate utility. When the copper is very arsenical, the tin, in dissolving, appears to retain the arsenic in the anode sludge, when it is less objectionable than in solution in the electrolyte; the presence of tin in the anode also makes the deposited copper smooth. These advantages, however, are not sufficient to make the application of the process generally remunerative.

One of the best methods of purification consists in electrolyzing the liquors from the depositing vats with a current density so high that all impurities save iron are deposited pell-mell with the copper. The operation is carried out in purifying tanks, of which a set of twelve is allotted to about 280 depositing vats. The cathodes in the purifying tanks are of sheet copper and the anodes are of lead. The process needs a somewhat large expenditure of current, and produces a good deal of impure copper; but it has the advantage that the copper is recovered as metal, which, though impure, is often more salable than is copper sulphate. The electrolyte, purified as regards arsenic and antimony, impoverished in copper, and still containing iron in solution, is brought up to strength with fresh copper sulphate and returned to the depositing vats, its purification and return being repeated until the iron accumulates to an inconvenient extent, when the liquor is finally worked up for copper sulphate.

The variety of these methods makes it abundantly evident that there is no "best" or even standard process of purifying copper electrolytes, and that the merits of every suggested procedure must be considered, not only from a chemical and technical point of view, but also with regard to local demands for by-products, such as blue vitriol and crude copper, and to local abundance of supplies of raw materials, such as sulphuric acid, scrap copper and the like. A process torn up by the roots, and transplanted to a distant site with different local conditions, is not likely to prosper.

Pumping for Irrigation *

By S. W. LUITWEILER, Los Angeles, Cal.

In southern California all the water obtainable by natural flow has been appropriated. There remains but one other source whereby a sufficient quantity can be had for irrigation purposes, and that is by means of wells, either dug or bored. In what way shall we raise a sufficient quantity to meet our demand?

Centrifugal Pumps.—When an abundant supply can be lifted without going to a greater depth than 40 feet, the centrifugal pump is without doubt the best pump for this duty on account of its cheapness and simplicity. It requires but little care—is always ready for use. While the best centrifugal pumps do not range over 50 to 60 per cent efficiency, varying according to the work, still they have so many good features that they cannot be overlooked for any work within their range. There are two classes of centrifugal pumps. The horizontal, adapted to work within 25 feet suction, is placed upon the surface ground and is quickly and cheaply connected to the driving power by means of a belt. The other—the vertical centrifugal—can be placed in a pit, taking care to submerge the pump runners under water in order that the pump may be always primed and ready to start. When the water to be lifted is to be had by a bored well at the bottom of a pit, the suction pipe may be dropped into the well pipe to a depth of 25 feet. The vertical shaft from the pump below, extending to the surface of the ground, or a little above, carries the pulley which drives the pump. Centrifugal pumps may be made to deliver water up to 100 feet economically by delivering the water from one pump to the other, either vertically or horizontally. This is seldom done, as the conditions under which they may be operated rarely present themselves. Taken under all conditions, when they can be used for the raising of large quantities of water cheaply, and considering the low cost and long life, the centrifugal pump is always to remain the favorite. By this I mean, of course, the best makes of centrifugal pumps.

Somewhat similar in operation to the centrifugal is the rotary pump; but on account of its short life and friction in its moving parts it is not used much.

Deep Well Pumps.—The other class of wells, which do not come within the range of centrifugal pumps, and which are generally located along the foothills or on the mesas, are known as deep wells, and require special pumps. Until lately this class of wells were operated wholly by plunger pumps, worked by cranks, either single or double acting. The single-acting pump is one of low efficiency, and for lifting large quantities of water is wholly unsatisfactory. There are several styles of double-acting pumps, all constructed for the purpose of throwing a constant stream; some do, others do not. The best of this class of pumps are those which do the work on the lifting stroke, as they have a greater range, and the pressure employed to do the work is against the foundations.

Compressed Air.—Another method of raising water is by compressed air. Under certain favorable conditions this system works well, but in many cases will not work at all. When a group of wells owned by one party are to be pumped, and when the water is not too far below the surface, it is the best system to use, as it would be expensive to pump a number of wells by putting separate pumps and power to each well. I made some experiments some years ago in pumping single wells by compressed air, but saw nothing to warrant the use of air for this purpose. Upon investigation, I found the best methods for performing the work covered by patents which are still in force. The only way left to lift water by compressed air, and not patented, is to blow the water out of the well pipe by the volume of air. This plan is not very efficient, as the air can escape through the joints in the pipe, and, as we use short lengths of riveted pipe in our wells, making no pretensions at getting close joints, this plan is more or less wasteful. Air is very hard to control, and the joints must be much tighter than is used to convey water, as a very small leak will pass a large quantity of air under pressure. While the air-lift people claim no valves are used in the well, there are several used in the air pumps and of a more delicate nature than is used in water pumps. The Pohle, Titus and other patents cover the right to use a separation pipe for the delivery of the water. This pipe extends down into the well, as does also the air pipe, which delivers the air into the water pipe at the bottom. In operation, the air arranges itself into air pistons, with water pistons, alternately an air piston and a water piston throughout the whole length of the discharge pipe. This patented air lift system has a much greater efficiency than can be had by other methods using air, and is considered the best means of lifting water from a group of wells at one time; but I would not recommend lifting water from single wells where pumps would do the work, first, because of its higher cost; second, because air compressors are very delicate machines, the pistons have very little clearance in the cylinders, and often the use of too much lubricating oil will cause them to hammer or pound; third, they should be used only in a well-built room, free from dust, as dust or grit soon cuts them out, and this country is very dusty at the season of the year when we need water for irrigation; fourth, air compressors must necessarily work very close in order to pump air, which is the thinnest substance with which a pump has to deal, and leaky air pumps are hard to conquer, and the loss in efficiency is much greater than that with leaky water pumps.

Gas Engines.—A good gas engine working on distillate will produce horse power for about 1 cent per horse power per hour. They are automatic in their operations and require little attention. I have known engines to work day and night for a week without stopping, while the attendants, having the three engines in charge and located a block apart, did not visit the engines oftener than two to three hours, and then to oil them. Using steam requires the constant attendance of the engineer as a matter of safety, the cost of fuel is double, and when boilers are used the wear and tear is considerable, as well as loss in time of getting up steam. The water used in boilers here soon forms a deposit on the tubes and it is hard to keep up steam. To keep the tubes clean and free from this formation is no small expense. Electric power will soon be an important factor in irrigation, but I doubt if its use will become general, as the cost of poles and wires to carry the current will not admit of going much distance from the main line.

* Condensed.

Some New Blacksmithing.

On Market street near Fifth, San Francisco, for several weeks a crowd rivaling in numbers the groups in front of the war bulletins has gathered to see a man in a window heating a bar of iron a cherry red and then hammering on it on an anvil. The wonderful part of it is that he heats the iron by thrusting it into cold water. This does away with all that we have associated with the work of hammer and anvil, the shop, the forge, the coals, blaze, bellows, etc.

The tank holding the cold water is about 3½ feet square. The water is about 2 feet deep. Two insulated wires from an electric dynamo are led into the room. The positive wire is connected with the metal lining of the tank. The other wire is secured by welding or solder or otherwise to a pair of tongs whose handles are covered with insulating material. The negative wire is long enough and flexible enough to allow considerable movement by the workman. The latter grasps with insulated tongs the spike, bolt, horseshoe or other object which is to be heated and dips it into the liquid. That's all. When it is hot enough he turns to his anvil and hammers the thing or drops it where another workman can pick it up, and then uses his magic tongs afresh to handle something else. Heating iron or steel to a cherry red by simply plunging it into cold water keeps the crowd as long as the man does it, and no wonder.

The Worst of the Dry Years Since 1850.

How bad the current year really is as compared with other bad years is shown by the diagram on this page, prepared by Prof. George Davidson of San Francisco and published in the *Daily Commercial News*.

San Francisco.

Table of the four wet seasons of very small Rainfall, between 1849 and 1898.

Wet Seasons	Total inches of Rainfall each season.	Days on which Rain fell.	Depths in Inches	Months: July	August	September	October	November	December	January	February	March	April	May	June.
1850-'51	7.40	51	0 1 2 3												
1863-'64	10.08	37	0 1 2 3												
1876-'77	10.00	46	0 1 2 3 4												
1897-'98 to the 18th of April 1898	7.75	45	0 1 2 3												
Average for 4 seasons	8.81	45	0 1 2												
Average of 48 seasons	23.70	66													
Largest in 1861-'62	49.27	83													

Geo Davidson

The table gives the monthly rainfall for the four wet seasons of 1850–51, 1863–64, 1876–77 and the present 1897–98 to date. The wet season is reckoned from the first of July of a given year to the end of June of the next year, and the wet seasons referred to are the driest recorded. The data used for the earlier years are from the observations of Thomas Tennent, 1849–90; and for the later dates, from the records of the Weather Bureau.

There is a chance yet for a little rain in April and May, counting by what fell in 1851 and 1864, but there is also as good a chance that April and May may be as dry as in 1877.

The figures are for San Francisco, and therefore have only a relative significance for the balance of the State, and yet every inch of rain that falls at San Francisco is represented by a large or small factor in every locality in the State, and on the average may be said to represent not less than $3,000,000 per inch in gold coin.

THIS paper understands the term "bullion" to mean uncoined gold and silver, and nothing else.

THIS month, at Houghton, Mich., the greatest mining shaft in the world has begun operation. After nine years of continuous work and an expenditure of over $2,500,000, the Red Jacket shaft of the Calumet & Hecla is now an integral part of the great copper mine, which pays quarterly dividends of $1,000,000, and is steadily producing conglomerate rock, carrying approximately 5 per cent of native copper. The Red Jacket shaft is vertical, all other shafts of the Calumet & Hecla following the dip of the lode, 37½° to the west of northwest. It was started in 1889, immediately after the last of the three great fires occuring underground in the older workings of the mine, which did damage of more than a $1,000,000. Work has been continued upon it night and day since that time, and the shaft stands without an equal in any mining field on the globe. It is 4900 feet in depth—but 380 feet less than a statute mile. It contains six compartments, each equal in size to an ordinary mining shaft, four of which are used for hoisting rock and lowering timber. One shaft is utilized for the ladderways, and the sixth and last compartment carries the wires and pipes for telephones, light, power, water and compressed air. The underground workings of the shaft are laid out with mathematical accuracy, the undeviating course of the copper bearing lode allowing the work to be planned thousands of feet ahead of the miners' picks. The great pumps which free the mine of water are incessantly operated interchangeably by compressed air and electricity. The power drills which eat the holes for dynamite cartridges, are run by compressed air alone, and there are more than 300 of these drills, each doing the work of a dozen men, working both day and night in the Calumet & Hecla mine. With a rock temperature of 87° Fahrenheit at the 4900 foot level, the cooling effects of the air from the drills is grateful.

SOME TIME ago inquiry was made of this paper regarding an oil made from maize or Indian corn, and after considerable inquiry on our part it is learned that a concern manufacturing glucose in Chicago, Ill., produces what is called "corn oil." It is extracted by pressure from the germ of the grain by a method similar to that used in the manufacture of linseed oil, leaving a residuum not unlike the oil cake of commerce. In the manufacture of glucose it was forced necessarily to first extract the germ. This, for a long time, was a waste. Now this company produces 350 barrels per day of corn oil. This oil is shipped in second-hand oil barrels; weight, filled, 400 pounds each. The price at the factory is 3 cents per pound. It is mostly shipped to England, where it is used in the manufacture of soap, though some of it is used in Chicago, mostly in mixing cheap paint. It is called a rapid drying oil. It is also used to adulterate linseed oil.

Recently Declared Mining Dividends.

Alice, Montana, 5 cents per share, $20,000; payable immediately.
Sacramento, Utah, 5 cents per share, $5000; payable April 30.
South Swansea, Utah, 5 cents per share, $7500; April 21.
South Eureka, California, 2 cents per share, $6000; payable immediately.
Mercur, Utah, 18 cents per share, $36,000; April 20.
Elkton Con., Colorado, 2 cents per share, $25,000; April 21.
Pioneer, California, 12½ cents per share, $12,500; payable April 26.
Alaska-Mexican, Alaska, 10 cents per share, $18,000; payable April 28.
Alaska-Treadwell, Alaska, 37½ cents per share, $75,000; payable April 28.
'76 G. M. & M. Co., Colorado, 2 cents per share; April 19.
Gold Coin, Colorado, 1 cent per share, $10,000; payable April 25.
Ruth mine, British Col., 75 cents per share.

Recent California Mining Incorporations.

Coarse Gold M. & D. Co., Fresno; capital stock, $60,000; subscribed, $12,000; J. J. Seymour, J. W. Cate, J. L. Maupin, C. A. Shattuck, L. H. Smith.

San Domingo M. Co., San Francisco; capital stock $500,000, subscribed $125; E. C. Kemble, A. E. Shaw, J. A. Allen, C. W. Edgecombe, R. H. Delafield.

Coast Industrial Notes.

—Over 500 carloads of lemons will be shipped from California this season.

—California sheep by thousands are being shipped to Utah, New Mexico and Texas to escape starvation from drouth.

—The California Asphaltum Co. of Ventura county has shipped its first carload of sulphuric acid, containing thirty tons, to Los Angeles.

—At present prices the owner of hay is as well off as though he had a paying gold mine. It is probable that importations may reduce the price later on.

—One of the effects of the California drouth this year will be additional interest in mining—the only State industry that has had any promise of profit in recent years.

—The trip of the battleship Oregon from San Francisco around the Horn to the Atlantic coast is a great argument for the Nicaragua canal, built, owned and operated as a national measure.

—From San Bernardino county it is satisfactorily reported that the litigation which has practically tied up the Nevada Southern, sometimes called the California Eastern, has all been cleared away, and Gen. Mgr. Siebert now confidently expects to be able to build to Goode Springs this summer, a distance of fifty miles.

—At Stockton, Cal., spot wheat has reached the highest price. One lot of 1500 sacks brought $1.75 per cental, and the mills are paying $1.70 to $1.72½ for milling wheat. Farmers think they will secure $2 for their wheat, as there will be but little of it raised in this State this year. The farmers in the vicinity of Stockton have about 26,000 tons in their possession yet.

—Writing to the State Department of the shipment of 1,200,000 feet of lumber from Puget sound to Corea, Horace N. Allen, consul-general to Sheol, says: This is the first direct shipment of United States timber to Corea. It is for the use of the Sheol-Chemulpo railroad, now being rapidly built by United States capital. Ties for immediate use will have to be obtained from Japan.

—A Fresno, Cal., dispatch says: Unless something at present entirely unforeseen happens, fully 100,000 head of sheep and cattle will die of starvation in that county alone, in the next few months, on account of the lack of grazing grounds. Urgent representation has been made to Senator White asking that the Sierra reservations in that part of the State be thrown completely open to sheep and cattle this year with no restriction as to the National parks.

—Coal discoveries and developments are numerous in California this month. In Lake county, near Lakeport, a 50-foot tunnel cuts four veins, one said to be 10 feet, which is doubtless an exaggeration. At a depth of 54 feet a small vein has been struck between Oakdale and Sonora. Near Cordelia a vein of soft coal is also reported uncovered. The Coral Hollow mines are producing a large quantity, which finds ready sale in San Francisco at $6.50 per ton, retail.

—The *Lumberman* says the demand from South Africa for lumber from this coast has subsided. Two years ago Delagoa bay promised to buy large quantities and started in by purchasing a good many million feet. All at once shipments ceased. It was alleged that rumors of war between the Boers and English were depressing trade. Recently, however, shipments are being made from the Baltic, which are reported to be quite extensive. If this continues there should be missionary work and education carried on in Africa.

—The engineer's office of the War Department has sent to the California Board of Public Works permission for the prosecution of the river work under the State appropriation for the improvement of the Sacramento and San Joaquin rivers. Colonel MacKenzie, in charge of such work, has notified the California authorities that the carrying out of the plans for cut-offs 6 and 7 of the San Joaquin river will be in accord with the general plans of river improvement, and that the use of State forces to carry on the work will be agreeable to the National Government.

—The Manufacturers' and Producers' Association this week issued a statement showing comparative railway rates, east and west bound, on some leading Pacific coast products, many of which are shipped in large quantities from this coast. For instance: Agricultural implements, eastward, $3.70; westward, $2.40; cotton bags, eastward, $3 30; westward, $1; leather belting, eastward, $2; westward, $1; boots and shoes, $3.40—$1.50; butter in cans, $2.40—$1; canned salmon, $1.70—$1; green fruit, $3.40—$2.40. The large figures indicate the cost of freight from Pacific coast terminals to Chicago or New York; the smaller, the rates from those points to San Francisco. The traffic committee of the association reports: "The matter of discrimination and inequalities of freight rates affecting the interests of the manufacturing and producing industries of the coast has claimed the attention of our association frequently during the past year, and the presentation of facts relating thereto is now brought before the managers of the transcontinental railroads with the belief that relief will be granted, and that fair play will be given to the Pacific coast industries. The Manufacturers' and Producers' Association of California represents over 500 of the leading manufacturers and distributors." A letter was sent to each member of the association, which says:

We beg to call your attention to the injustice and discrimination against the manufacturers and producers of California by excessive rates of freight at present in effect from San Francisco and other Pacific coast terminals east bound, as compared with the west bound rates on the same commodities from Chicago and New York to San Francisco and other Pacific coast terminals.

Under existing conditions the manufacturers and producers of California are unfairly handicapped in their efforts to obtain a market for their products, as against the manufacturers and producers of Eastern States, on account of the great disparity of rates now existing on the same products east and west bound.

Your traffic committee has compiled a comparative statement, which we herewith inclose, showing the east and west bound transcontinental rates on some of the Pacific coast products. Taken generally, this statement shows the east bound rates to be from 10 to 100 per cent greater than west bound rates on the same commodities.

Our State stands well in the front ranks of the great producing States of the Union, not only as to products of the soil, but in its manufactures, and it is eminently unfair and unjust that we should not receive the same consideration at the hands of the transcontinental lines as is accorded the manufacturers and producers of Eastern States.

It is desired by your committee to add to the inclosed statement the rates of all commodities handled by our members, and we would ask each and every member to communicate with this committee, giving existing rates, yearly tonnage, etc., of such commodities as they are interested in, at the same time pointing out such inequalities as exist and suggesting what recommendation should be made.

It is of great importance that our members give this matter their immediate attention, as your committee will have to compile the data received and present our petition to the Transcontinental Freight Bureau, who meet at Milwaukee on May 10th next.

In order to secure a proper hearing and correction of the existing inequalities in existing transcontinental freight rates and classification, which, as at present constituted, work so disadvantageously to our Pacific coast interests, it is absolutely necessary that all manufacturers and producers of this State should stand firmly together, and by united effort, if necessary, the routing of all their freight, both east and west bound, over the line or lines that will give proper and reasonable consideration to our Pacific coast interests. We are confident that much can be accomplished toward securing an enlarged, profitable trade area for our Pacific coast manufacturers and producers.

In presenting our petition to the transcontinental roads we must give them absolute facts as to the tonnage east bound that now exists or can be created by reasonable rates on California products; hence the request to you that you inform us fully regarding your line of business, so that our petition will be comprehensive and accurate. Respectfully yours,

Edw. Everett, chairman; Frank L. Brown, W. F. Bowers, James W. Kerr, Charles R. Allen, J. A. Folger, C. P. Rossi, Traffic Committee.

Personal.

M. P. Boss of San Francisco is at Vera Cruz, Mexico.

C. JACKSON becomes Supt. Gold Blossom mine, Auburn, Cal.

J. M. BUFFINGTON becomes Supt. McGibbin mine, near Magalia, Cal.

R. S. RAW, Supt. Septimus D. Co., Placerville, Cal., is in San Francisco.

G. W. STARR has been appointed Gen. Mgr. Empire mine, Grass Valley, Cal.

J. C. HOPPER, Mgr. Uncle Sam mine, French Gulch, Cal., is in San Francisco.

D. R. OLIVER, owner of the Harriman mine, Sonora, Cal., is in San Francisco.

F. W. WILMANS, Pres. Rose Creek M. Co., Sonora, Cal., is in San Francisco.

PROF. J. E. KEELER has accepted the directorship of the Lick Observatory.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., is in San Francisco.

W. H. CLEARY JR., Supt. Petticoat mine, Railroad Flat, Cal., is in San Francisco.

D. FRICOT, Grass Valley, Cal., is at Fricot City inspecting his Mother Lode mines.

H. MCCORMICK has been appointed Supt. Black Diamond mines, Tombstone, Ariz.

M. MIERSON, owner of the Mierson Con. mines, Placerville, Cal., is in San Francisco.

D. H. JACKSON, owner of the Salisbury mine, Placerville, Cal., is in San Francisco.

B. MASON of the Newton M. Co., Placerville, Cal., has returned home from San Francisco.

N. W. MOUNTAIN, part owner of the Newton mine, Placerville, Cal., is in San Francisco.

F. CHAPPELET, Supt. Mayflower mine, Forest Hill, Cal., has returned to the mine from Oakland.

T. JAMES, Supt. Shorty Hope mine at Jacksonville, Oregon, has returned home from San Francisco.

C. H. WEATHERWAX, part owner Bob Red mine and Sec. El Dorado County Miners' Association, has returned to Placerville from San Francisco.

G. MAINHART, Supt. Omaha Con. mine, Grass Valley, Cal., has returned home from San Francisco.

T. KEARNS, managing owner Silver King mine, Park City, Utah, has returned to the mine from San Francisco.

Commerical Paragraphs.

THE Jeanesville Iron Works Co., Jeanesville, Pa., and Denver, Colo., are shipping two compound condensing mine pumps, 1000 gallons capacity per minute, to Japan.

THE Westinghouse Electric Co. has a Government order for $700,000 worth of generators, motors, dynamos, etc., to be used for the installation of light and power plants on vessels now being equipped for Government service. The company will receive a bonus of $25,000 for quick delivery.

SUPPLEMENT No. 2 to Catalogue No. 2, third edition, "Specifications of Mining and Milling Plants for Prospecting and Developing Gold Quartz Mines," of practical value and interest to every miner, issued by the Joshua Hendy Machine Works, 38-44 Fremont street, San Francisco, Cal., and sent upon application to any address.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 12, 1898.

602,301.—PIPE SLITTER—A. J. Bramlette, Downey, Cal.
602,055.—BED—T. H. Campbell, Seattle, Wash.
602,153.—WINDMILL REGULATOR—W. P. H. Campbell, Stockton, Cal.
602,209.—ROOF BRACKET—D. Cleland, Oakland, Cal.
602,213.—POLISHING DEVICE—G. H. Dyer, S. F.
602,130.—CARPENTER'S TOOL—B. Fuller, Sacramento, Cal.
602,319.—WAGON BRAKE—J. A. Gilkey, Springfield, Or.
602,161.—MOTIVE ENGINE—A. Howard, S. F.
602,221.—CRUSHING MILL—H. L. Jessen, Watsonville, Cal.
602,135.—PIANO—J. C. King, S. F.
602,191.—DILATOR FOR FINGERS—R. A. Lucchesi, S. F.
602,345.—FEED CUTTER—A. Mattijetz, Los Angeles, Cal.
602,139.—RIVET MACHINE—L. E. Miller, Los Angeles, Cal.
602,170.—AIR VALVE—E. A. Rix, S. F.
602,144.—LOCK—W. D. Roberts, Portland, Or.
602,198.—COMPRESSED AIR HAMMER—J. Schmidt, Rio Vista, Cal.
602,145.—HAY RAKE—R. A. Simpson, Florence, Cal.
28,468.—DESIGN—W. E. Gregory, Astoria, Or.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRINDING AND POLISHING DEVICE.—George H. Dyer, San Francisco, Cal. No. 602,213. Dated April 12, 1898. The object of this invention is to provide an apparatus which is especially designed for grinding and polishing surfaces, and in a mechanism by which the apparatus can be moved from side to side, forward and back, tilted and generally adjusted to any surface or contour upon which it is desired to operate. It consists essentially of a suspending rod, a main frame having one end carried thereby, disks or grinders journaled and supported in the opposite end adapted to rest upon the surface to be ground or polished, a flexible driving belt and direction pulleys over which it passes, and through which power is transmitted to actuate the grinding disks and means to connect the carrying device with the frame and adjustable collars for varying the length and tension of the belt. Anti-frictional bearings are so disposed as to support the grinding disks and limit the cut as well as to insure its being leveled, and these devices have means for adjustment up or down. The main frame is also caused to oscillate transversely while being advanced so as to cause the grinders or cutters to work over a given amount of space while doing the work. The framework in which they are journaled may also be tilted or turned and adjusted so that the cutters will work upon any desired angle.

COMPRESSED AIR HAMMER.—Jacob Schmidt, Rio Vista, Cal. No. 602,198. Dated April 12, 1898. The object of this invention is to provide an apparatus in which the air can be first compressed to a high degree, then delivered suddenly into a cylinder having a plunger and connecting rod through which the hammer is actuated. The invention consists of a cylinder having a piston movable therein and a piston rod, the lower end of which carries a hammer, a second cylinder arranged with relation to and connecting through an open passage with the upper end of the first named cylinder, a plunger and mechanism by which it is reciprocated in the second cylinder to compress the air therein, a valve movable so as to retain the connecting passage closed until the air in the second cylinder has been compressed with the desired tension, connection between the valve and the crank shaft through which the compressing piston is actuated so that the valve is reciprocated to alternately close and open the passage. In conjunction with this is a discharge passage from the lower end of the hammer cylinder and a valve adjustable to intersect said passage to any desired degree so that a back pressure may be created in the lower part of the cylinder, and the force of the blow delivered by the hammer and connected parts can thereby be regulated.

PORTABLE CRUSHING MILL.—Henry L. Jessen, Watsonville, Cal. No. 602,221. Dated April 12, 1898. The object of this invention is to provide an apparatus which is portable, and especially designed for crushing barley and other grains, a mechanism for communicating power to operate the same and means for the support and transportation of the combined mechanism. It consists essentially in the combination of crushing rolls with a means for actuating the same, an elevator casing having a discharge spout at one end, the regulating feed supply at the opposite end, a bucket elevator within the casing with means for actuating the same driven from one of the crushing rolls, an adjustable gate operating through the elevator discharge spout between the upper end of the elevator and the crushing rolls, so that the centrifugal impulse imparted by the elevator at its discharge end and the adjacent gate will regulate the supply to the rolls according to the speed of the elevator. The whole is mounted upon a wheeled base or support having a driving motor thereon and may be moved from place to place, it only being necessary to drive it up to the most convenient point for doing the work, and it will then operate to crush any small or large number of sacks of grain as may be required at a minimum of expense.

Some Notes on Sulphur and Sulphur Products.

Written by JNO. W. GRAY.

It has been said that the consumption of sulphuric acid by a nation is a true index of its commercial prosperity. The large increase in the manufacture of this article in America, of late years, and the rapid growth of the industries which are large consumers of and dependent upon the acid for their operations, have been remarkable, and can be truly accepted as one of the certain indications of the constantly increasing commercial prosperity of the United States. The economic results achieved by obtaining sulphur from pyrites, in lieu of the more expensive brimstone, in the preparation of the acid, has greatly stimulated the mining of the former material, and has opened a field of investigation offering tempting rewards to those who may discover the means of utilizing the wastes from the burning of pyrites.

As the important and expensive ingredient in sulphuric acid is sulphur, and as, besides, sulphur has many other applications and uses of commercial importance, it would seem as if the consumption of sulphur by a nation would appear a truer index of its commercial prosperity than that of sulphuric acid, and that the saying quoted above might rightly be changed to so read. As the United States is an enormous consumer of sulphur, the occurrence, distribution, value, etc., of this substance are matters of interest to many, and the publication of a few notes concerning the sulphur industry in general might not be out of place.

The uses of sulphur are varied and extended—for making gunpowder, for bleaching purposes, for insecticides, for taking impressions, etc., and for the manufacture of sulphuric acid, the most important substance consumed in chemcal manufactures. This acid is very largely used in the refining of petroleum and the preparation of the rock-phosphate fertilizers. Other uses are for the manufacture of mixed acids for making explosives, such as nitroglycerine, cellulose, etc., for bleaching paper pulp, for preparation of nitric, nitrous and hydrochloric acids, for manufacturing purposes, for carbonating soda and mineral waters, and for general chemical uses. Few better trades are to be found in this country than those in products which come directly from sulphur.

Sulphur is obtained from deposits of the native mineral and from pyrites. The sulphur of commerce is the native material purified. As found, it occurs in rocks or mixed with certain earthy impurities. The occurrence of the mineral may be described under two conditions: First: The solfatara type, deposited directly from sulphurous gases in regions of expiring or active volcanoes, forming solfataras. The sulphur is found in crevices in the lava or tuffs, or in the sands, ashes and clays resulting from the action of acid fumes on the lavas. Second: The gypsum type, resulting from alteration of gypsum by reducing action of bituminous matter, occurring in a series of sedimentary rocks, with marls, shales and limestones prominently developed. The gypsums, as a rule, have been formed in the evaporation of salt water, and often has bodies of rock salt associated, as in Sicily.

The first condition of occurrence includes the deposits of Celebes, Alaska, California, Nevada and Utah; also, Japan, Mexico, New Zealand, New Hebrides, etc., while the second type includes generally the deposits of France, Greece, Spain, Italy, Russia, and those of Louisiana and Texas.

Although the United States is the largest buyer of sulphur, its home resources have not been much developed. Many countries produce sulphur, but Italy has always been the chief producer. The reason for this has not been the absence of deposits elsewhere, but the fact that competition has been in great measure prevented by the cheapness with which Sicilian sulphur has been mined and put upon the market. In 1896 a syndicate was originated to control the Sicilian sulphur product. Production was fixed at 340,000 long tons annually, while the production in Great Britain, by the Chance–Claus process, was at the same time limited to 40,000 tons. This trust was to maintain the strength of the market, which I believe it has succeeded in doing, owing to the absence of dangerous competition.

The greater part of Sicilian sulphur is still extracted from the gangue in kilns, the necessary heat being supplied by the sulphur. In some cases coal or wood is used as fuel, or the sulphur melted by superheated steam, or a solution of calcium chloride, of which the boiling point is slightly higher than the melting point of sulphur. The proposition to extract the sulphur by means of carbon disulphide does not seem to have become successful. The consumption of sulphur as fuel in kilns is one-third or more of that contained in the rock. Rock containing less than 10 per cent sulphur is not treated. The average of the Sicilian mines is about 20 per cent. The cost of treatment is about 19 cents, and the cost of sulphur of the best quality, delivered f. o. b. on ships in Sicilian ports, is said to be about $16. The regenerative furnace for treating the rock has been largely adopted, and steam extractors are coming into general use.

In Great Britain the Chance–Claus process, already mentioned, is used. This is a chemical process, which produces sulphur from the great mass of waste products of soda works. A large part is recovered as "flowers of sulphur," which finds a ready sale on account of its purity and attractive appearance. In this process 10 to 15 per cent of sulphur is lost in gaseous form and in flour. Nevertheless, large amounts of sulphur are yearly produced, and at prices which make the process a commercial success.

The production of sulphur in countries other than Italy is not great, and rarely amounts to much more than the local demand. In the eastern hemisphere Japan has been a considerable producer, and some of her product finds its way to the west coast of America.

Although there are several deposits of sulphur in California, none are mined in any large way, if at all. Large deposits of the mineral are known at many places in the United States. In Nevada the Rabbit Holes Springs mines have been worked irregularly, but the cost of production, transportation charges, etc., seem to have made the cost so nearly equal to that of imported sulphur as to limit profitable mining. The important deposits of southern Utah are being successfully worked with increasing but as yet limited output. The great deposits of Louisiana, probably the most important known, have not so far produced largely, owing to peculiarity of occurrence and difficulty of mining. None of the promising Texas deposits have been made producers, although efforts to that end are now being made. Sulphur in quantity is reported from Alaska, Washington, Wyoming and Arizona, but none of the deposits are at present being developed. In northern Mexico some promising deposits are now being opened up, but little is known definitely of them.

An enormous quantity of sulphur is used in this country, and the market is a tempting one for local producers; but in a general way it may be said of sulphur deposits that they are apt to be irregular, although rich in places, and that extended pits or drill holes are desirable before definite conclusions can be drawn as to the value of deposit. Deposits well located which can be economically worked, and with cheap transportation, especially if by water, ought to easily command the attention of capital, and it is a matter of some surprise that this branch of mining is not more actively pursued, especially in this part of the world, where such enterprises, under the right conditions, would undoubtedly prove profitable.

Considerable deposits are said to exist in Peru, in the volcanic regions of New Zealand, and in some of the islands of the New Hebrides group. Some of these are large and important, and could be depended upon to supply sulphur in quantity.

Australia imports sulphur from Europe for its chemical industries. In New Zealand there is a growing industry in the conversion of the phosphate of lime found there into superphosphates, and there is also a demand for sulphur for the manufacture of sulphuric acid. In California and in South America, especially in Chili, there is a great demand for the material. All these localities could easily be supplied from some of the places last mentioned, and there seems little doubt that good markets could be found, if the working of the deposits were undertaken.

The consumption of sulphur in the United States, derived from the native mineral, was as follows: From home production, 3800 long tons; imports (mostly from Sicily), 146,420 tons. Average price in New York, about $19. The price on this coast for best quality rules higher, as it also naturally does at all inland points.

The rapidity of growth in this country of all industries upon sulphur as the base of their manufacturing is astonishing. The consumption of pyrites in 1890, in the manufacture of sulphur products, was very large, and two-thirds of the mineral used was imported from abroad. In the Mineral Industry, from which much of the information in these notes was obtained, it is stated that the best practice of the world is now based upon getting sulphur from pyrites, at about half the price of brimstone. In a most interesting manner the possibilities of mining for pyrites are pointed out, and the unlimited demand which exists for the products of such ores is called to the attention of capital. The proposition of mining and utilizing American pyrites for all the minerals they contain offers a means of freedom from the dictates of the Sicilian mine owners, and the inauguration of the new industry mentioned would save the payment of millions each year to foreign producers of brimstone.

An Interesting Showing.

J. A. Edman, Supt. Diadem mine of Plumas county, Cal., has some interesting fossils and ores from the mine he has opened and managed for many years. Mr. Edman became convinced years ago of the sedimentary origin of the Diadem lode, and, after long continued exploration of his lode, discovered convincing evidences of his theory in well defined fossil remains. These are chiefly found in and near the body of dolomite that forms the central core of the lode. which on the 300-foot level averages 60 feet in width between walls. The fossils consist of crinoid stems, fragments in yellow hornstone and fragments of corals, also in hornstone. Most abundant are the low forms of organic life, represented in Loftusia Columbiana, allied to the Foraminefera which occur, forming masses of red hornstone, made up almost entirely of these minute organisms, oolithic or spherical in form, from microscopic sizes up to ¼-inch in diameter. In many specimens the fossil rock has, through metamorphic action, been changed to a coarsely granular rock, carrying gold up to a value of $4 per ton. The fossils mentioned were submitted to Prof. Schuchert of the National Museum at Washington and were determined by him as belonging to the lower Carboniferous period, the Loftusia Columbiana having been found some years ago in British Columbia by the celebrated geologist, Sir Dawson.

Important as this discovery may be from a scientific standpoint, another late discovery by Mr. Edman promises to affect in no small measure the future of our gold-bearing lodes in the metamorphic rocks. It appears that the central core of the Diadem lode consists largely of dolomite generally much decomposed, but becoming harder in depth. In this hard dolomite occur irregular lenses of a blue-black mineral, largely dolomitic, which contains gold in chemical combination, with lead, copper and selenium, and carries values from $20 to $250 per ton. In this selenide of copper is occasionally found, and, as a rarity, crystalline grains of the selenide of gold and silver.

The London Mine Promoter.

A San Francisco man who has had some recent experience in personal dealings with London mine promoters contributes his impressions of their methods, etc., which indicate that, so far as the mine owner is concerned, such experience is usually more interesting than prosperous. He says:

Not one in a hundred of the people who go to London with schemes, seeking a sale of property, especially mines, ever reaches the higher and more respectable class of capitalists. Such are very difficult of access, and unless the parties go well endorsed from first-class men on this side, they can make no headway, or are able to bring their business before the men who are really able to carry through an operation without recourse to the public. Promoters abroad and the uninitiated generally fall into their hands, the first impression being that they are heavy capitalists and fully able to carry through an operation and have no end of money, which error is manifest later.

The process of getting a mine on the London market begins with a contract with the person having the property for sale, whereby he agrees to sell it for so much money, and so much in shares, the money really representing all he is to receive, the shares over and above going to the promoters, and not unfrequently he is forced to take a portion in shares as cash. The next step is to find a broker who will join with the promoters and do the work of issuing the prospectuses. This having been arranged, the next step is to drum up a set of names to act as directors, and here the hard work begins. The success of the scheme depends greatly upon the character and standing of the Board. A well-known banker, an M. P. and a scattering fire of titled names are essential. The latter are the easiest obtained, as they are promised salaries. The others are more difficult, for the English law is very stringent and trustees are held to a degree of responsibility that, in many instances, has resulted seriously to those who have lent their names to schemes that have turned out badly. As the law has a disagreeable construction where there has been misrepresentation, it is liable to be called fraud, which implies imprisonment.

The consequence is that there must be a deal of research, and the scheme must be fortified with the most elaborate reports, maps and documents to satisfy the parties lending their names, and all are scanned and gone over repeatedly; but, as a general thing, the promise of a goodly number of shares as a "quid pro quo" smooths the road, and after the owner of the property has been under fire and before the proposed trustees a dozen times the final assent is given. Then comes the prospectus, and here is where romance runs riot, and Jules Verne would hide his diminished head.

There seems to be no law restricting the promises of incredible dividends, and an ordinary prospectus reads like a tale of the Arabian Nights. Two or three hundred per cent is nothing; and, as the broker sends tons of these circulars all over the Kingdom, the poor, the ignorant and the credulous, dazzled by the promises of such enormous returns on the investment, and seeing the array of respectable names in the Board—the Hon. Wm. Mucklebury of Mucklebury Hall, the Right Honorable Senior Squashhead of Squashtown, the Hon. Lord Noncompoop, etc.—forward their subscriptions—all their little savings—and look forward to a realization of their wildest hopes.

(*To be Continued.*)

IN the issue of the 9th inst., in an article "A Question Answered," giving the per cent of grade required for an economic tram track, the figures .0036% should have read .0026%.

Mining Summary.

CALIFORNIA.

Amador.

(Special Correspondence). — It is reliably stated that work at the Pioneer mine, near Plymouth, is to be resumed in the near future. I am informed that both at the Oneida and South Eureka a find of good ore has been made. There is a probability that a new shaft, vertical, will be sunk at the Kennedy. The present shaft is said to be such that it makes ore production quite an expensive item.

Jackson, April 19th, '98.

At the Ballot mine a new shaft was started which will be sunk 400 feet. A 15-foot vein of good ore was struck last week. S. R. Porter is Supt. At the Central Eureka at 1060 feet a 3-foot vein of good ore was uncovered. The *Record* says that a mill is among the early probabilities on this property.——At the Lincoln mine active work is in progress. Work has begun on the shaft and it is expected to drive this at the rate of 150 feet per month. Senator Voorhels is supervising operations.

W. S. Lyle, Mgr. Fogus mine at Volcano, in crosscutting opened a ledge from 3 to 10 feet wide that assays from $20 a ton upwards.

Griesbach & Mason have tapped the ledge in the old works of their property at a depth of 100 feet. The ledge is 2 feet wide and the ore runs about $20 per ton. —Two men took out eight ounces of gold last week in the Cleveland gravel mine.——The Reward mine at Pine Grove has reached 150 feet depth.——An ore body from 3 to 5 feet wide of fair grade milling ore was discovered in the Decker mine.——At the Wildman-Mahony the main shaft has reached 1300 feet. The new shaft has reached 65 feet.——The old Tellurian mine, abandoned for many years, is being cleaned out by the management of the Tennessee property.——The Amador *Ledger* says that the Pocahontas at Drytown struck a 3-foot ledge at the 400 level.——The Argonaut-Kennedy lawsuit has been transferred to Calaveras Co.——Hite Bros. & Co. have found paying gravel near Coyoteville.

Calaveras.

M. McNear has secured an extension on his bond on the Red Gold mine, at Murphys, and increased the laboring force. A shaft will be sunk and other improvements made.——Riley & Haddock have opened the old Gallagher-Mallroy mine and are taking out some good ore.—— J. C. Seiffert has bonded the Kentucky mine at Mokelumne Hill to the Western M. Co. for $29,100.

El Dorado.

(Special Correspondence).—The Grand Victory mine has come into new ore that is better grade than any heretofore found in the mine. The additional stamps are about in place, and in a few days thirty in all will be in operation.——The pay chute in the Larkin is 12 feet wide. The 5-stamp mill runs night and day. A new vertical shaft is being sunk; cages instead of buckets will be used.——The Gentle Annie mine is making a new record in ore production, which has generally been good grade; but a recent find is richer than any previous discovery.——The Boulder mine, near Shingle, continues operations with increasing success.——The Taylor mine is running on ore from the 1200 level.——The old Columbus mine has been unwatered and the ledge has been found. Active work will continue on this property, which had never been worked to depth of any consequence, and has been abandoned eighteen years. It is a matter of record that from surface diggings, and to the shallow depth of 60 feet, a few Swiss-Italians took out enough money to buy large holdings in Marin county, where they live to-day in luxury and ease.——I am reliably informed that Hanley & Poor, who are working the porphyry seams near Kelsey, sold $2500 worth of gold here last week. This porphyry formation is a feature of that section on Rock creek and the American river. The old Dalmatia mine was a sample of the rich products of that locality. This is another property that was not worked to any great depth.

Placerville, April 17th, '98.

Nugget: Rhodes & Hurley have taken out over $8000 from their porphyry diggings between Kelsey and Garden Valley.——W. Monroe is having an ore crushing made at the custom mill here from Mt. Murphy, near Coloma, which has produced some rich pockets.——The French company operating in El Dorado and Placer counties will make Ralston its headquarters. M. Rigaud will be Gen. Mgr.

Inyo.

Sixteen men are at work in the Molus mine at Bishop. The mill is expected to be in operation shortly.

Kern.

The Johannesburg Reduction Co.'s mill is running on Camperdown ore that is turning out satisfactorily. The Merced mine from forty-one tons of ore cleaned up $1250.——In the King Solomon mine a ledge between 3 and 4 feet of high grade has been discovered.——Glennie & Harris found a 20-inch ledge of good grade ore.——Work has been resumed on the Blackhawk mine. The Yellow Aster M. Co. has purchased the Skillings wells and pipe line and will build a mill of thirty stamps or more.

The Wedge mine at Randsburg on the 250 level discovered another ore chute from 12 to 15 inches wide that averages $240. A mill run of sixty tons will be made May 1st.——E. D. Snyder bonded three claims near Garden station for $6000 and is pushing work.——The Ashford M. Co. has begun work on the Pinmore mine.

Mono.

R. T. Pierce, Supt. Jackson and Lake View M. Co. at Lundy, has left Washington on his return home. He has for some weeks been in consultation with his company, and as a result of the conference an addition to the mill is to be made that will give it three times its present capacity. A new level will also be opened.

Napa.

The old Redington quicksilver property will, it is said, resume work under a London company, to be known as the Quicksilver Mines California, Limited It is said to have been purchased by G. Darsie of Scotland and A. McMillan of California. The capital is $750,000.

Nevada.

(Special Correspondence).—The Brunswick mine, in addition to sinking an additional 150 feet, will install electric power. The output of the mine is said to be such that upwards of $25,000 to be expended on the contemplated improvements can be accomplished, it is expected, without levying any assessments.

Grass Valley, Cal., April 20th, '98.

(Special Correspondence). — The Reward mine, which is turning out high grade ore, made another shipment of this class, while the 2-stamp prospect mill is running steadily on the lesser grade. The mine paid its first dividend last week, and last month's cleanup, which is known to have been very satisfactory, is not included, nor is the last shipment of high-grade ore. It has become a regular thing now to take out ore from the Reward that runs $400 per ton, exclusive of sulphurets of which the ore carries a high percentage of good grade. This property is another illustration of abandoned mines in this county that has improved with deep working. The company controls the water through a 2400-foot drain tunnel, which was cut at an expense, it is currently stated, of $22 per foot.

Nevada City, April 18th, '98.

The German mine, near Washington, which has been idle nearly two years, is to resume work May 1st. There is a 10-stamp mill on the property, and a tunnel about 700 feet. The ore is of an average grade. The milling facilities are to be enlarged after some further development. M. D. Cooley at Washington is Supt.——The Omaha Con. Co. at Grass Valley will outfit their property with electric power.——The new shaft on the Homeward Bound of the Omaha Con. Co., which was begun less than a year ago, has reached a depth of more than 1000 feet. The cost of sinking has been about $12 per foot. There is no timbering required below the 300 level.——Work is progressing on the copper property at Spenceville and ore is being hauled to Wheatland for shipment.

Union: The Brunswick shaft at Grass Valley will be sunk an additional 175 feet, and the work will be pushed as rapidly as possible. The shaft at present is 900 feet.——The Gaston Ridge mine, at Graniteville, will soon place ten additional stamps. The Supt. is D. Harmon.

Placer.

Colfax *Sentinel*: The old Liberty Hill dam, built fifteen years ago and well known in the controversy between miners and farmers and condemned by Judge Sawyer, has stood the test of years, a reminder of the error of his judgment. The dam is situated near Dutch Flat, in Bear river. Last year a permit was given to increase the height of the dam. The new portion has been built from the heavy wash of the Polar Star gravel mine. Great care has been taken to make the dam permanent. The Debris Commissioners have pronounced it satisfactory. The dam has been raised 20 feet. The width of the base is over 300 feet at the bottom and has an average width of over 200 feet. The length is about 80 feet at the bottom and about 360 feet at the top. It has a capacity of about three-fourths of a million cubic yards. A new spillway will soon be cut in the solid rock on the Nevada side, when another raise is contemplated. The raising of the dam has made possible the opening of two mines—the Polar Star at Dutch Flat and the Liberty Hill mine on the Nevada side. The Polar Star is operated by W. Nicholls. About thirty men are employed. At the Liberty Hill mine about twelve men are employed.——Bry & Lazano are sinking on their property near Ophir. They have a 2-foot ledge of sulphuret ore.

The statement of the Pioneer Mining Co. for February and March is as follows:

	March.	*February.*
Tons rock crushed	950	940
Value gold bars	$15,730	$14,100
Pay roll	4,879	3,948

Plumas.

The *Independent* says there is an almost entire absence of snow on the higher ridges of the county and the water in the streams has not been so low since 1864. Quite a number of claims which heretofore yielded each season enough gold to supply the necessities of the families of their owners for the entire year will not give a color this year for want of water.

San Benito.

The annual report of the New Idria Quicksilver M. Co. for year ending Dec., 1897, shows net proceeds from sales $125,197, increase in cash supplies $3730; total receipts $128,928; total expenses $81,342; net earnings $47,586; dividends $30,000; total surplus $28,248. There were produced during the year 15,310 tons of ore and 3605 flasks. The new reduction works were in full operation only seven months. The development and prospecting work has been continued with good results.

San Diego.

The recent ore discoveries on the edge of the desert are developing good results.——The Kentuck S. and Cheerful Moments mines in the Banner district are sold to New York capitalists, to be known as the California G. M. & M. Co. The price given out is $1,000,000. Development work has begun. A 1200-foot tunnel will be run, from which a 400-foot shaft will be sunk. Power drills are in use. The mine is an old property, but no work has been done on it for twenty years.——The Ranchita, Ready Relief, Antelope, City of Richmond and Elevada mines are all in operation.——Work is to be resumed on the North Star, Helvetia and Cincinnati Belle.

Shasta.

At Whiskytown a ledge was discovered in the Colorado mine at 60 feet depth that mills $100 per ton. A 300-foot tunnel in the same property at a depth of 300 feet taps a 2-foot ledge that runs from $8 to $60 per ton, exclusive of sulphurets.——Development will begin shortly on the Burns & Woodward property.——D. Pesenti sold five claims to the Mountain Copper Co. for $625.——D. Thompson is opening a quartz property near Keswick.——The ledge of the Tacoma Con. M. Co., near French Gulch, is 4 feet wide and runs $50 per ton.——A half interest in the Black Hawk and Cape Horn claims was sold for $2000.——Davis & Co. are at work on a 15-foot ledge of copper ore near Whiskytown.——The reverberatory furnace at the Keswick smelter is running night and day, and disposes of ninety tons of the fine ore every twenty-four hours.

The Diestelhorst Bros.' dredger continues operations on the Sacramento river with fair success.——The Union Mines Co. No. 2 are sinking shafts to bedrock on the old Sacramento river channel near Middle Creek. Heretofore bedrock could not be reached in this claim because of too much water. Operations are being conducted by a steam power hoisting and pumping plant.

Siskiyou.

J. W. Armstrong has taken a bond on the Jennie Lind mine for $1500.——Gilso & Co. during March, with a 5-stamp mill, produced $4000 on the California Queen mine.——H. J. Barton is putting in a wing dam at Oak Bar, and A. Garrett is wingdamming at Hamburg Bar.——Fifteen tons of ore from the Mountain King mine milled $60 per ton. The Miner's Dream mine is developing a ledge of fair size and quality. On the Commodore mine a 20-inch ledge has been found.——The Vesey Bar Co. at Honolulu began hoisting gravel last week.

The Yreka *Journal* says that arrangements are in progress to place an extensive dredging plant in Yreka creek near Yreka.——The McNulty ranch has been bonded for $42,000; also, the Foster, Perry and Miller places. Negotiations are on foot to secure the Blake place and Burgess fields. Work is to begin shortly at the Perry place.——J. P. Bradley contemplates the erection of a 20-stamp mill, to be operated either by electricity or steam. He has a 6-foot ledge of fair-grade ore.——The Diestelhorst dredge on the Klamath river is working constantly and taking out good gravel.——Le May & Co. find good prospects in the Cape ledge on Greenhorn.——The gravel beds of the Siskiyou M. Co., near Happy Camp, is owned by New York people, and comprises 2000 acres. The water is conveyed to the claim through a fourteen-mile ditch and flume. Four giants are used and twenty men employed during the water season. During the last three months' run the three cleanups amounted to $19,000. It is thought the company will have enough water to run until July. Nearly all the small placer mines on the Klamath and Salmon rivers are idle for lack of water.

Trinity.

Bainbridge Bros. are developing a 3½-foot ledge near Hall City which yields good assay values.——Work on Poker bar, an area of auriferous gravel on the Trinity river, has never produced the success that encourages continuous operations because of the difficulty of getting water enough. Montana men now in possession of the property propose to dam the Trinity and flood the auriferous deposits. A dredger will be floated over the bar and put in operation.——The Brown Bear mine at Deadwood made a shipment recently of seven tons of ore to San Francisco that netted $7600.

The Trinity Center Hydraulic Co. is running night and day.——The Strode Bros., near Carrville, have resumed work in their mine and mill.——H. Wagner is pushing development work on his properties on Coffee creek. From 6 to 10 per cent is concentrates, which run from $300 to $500 per ton.——At the Integral mine the tunnel has reached 1600 feet.——Volmers & Stoddard have resumed work on their quartz property near Cinnabar.

The flooding of the Altoona quicksilver mine last year was caused by tapping a subterraneous reservoir. The water is supposed to have gathered from Soda Springs, above the lower workings. The water was brought under control by the installation of pumps of large capacity, which even now are in operation day and night. Work proceeds in the mine without interruption. The output of quicksilver for 1898 it is calculated will reach 500 flasks per month.

Tuolumne.

The Carlotta mine, which has been closed for three months, has resumed work. The shaft has reached 218 feet, but sinking will not be continued until the latter part of May. Drifting has began on the 200 level. The ledge is 12 inches wide and mills $25 per ton in free gold. The sulphurets gain 5 per cent and average $150 per ton. The Carlotta has a steam hoist capable of 800 feet. A 10-stamp mill is contemplated for the property in the near future. D. Neagle is Supt. and employs twenty-five men.——The Pennsylvania is operated by the same company. The shaft is 200 feet. A drift has been run 100 feet each way on a ledge 18 inches wide that mills $25 per ton, with 10 per cent sulphurets, that run from $200 to $400 per ton. A carload of ore shipped to Selby's yielded $121 per ton.——The shaft at the Grizzly mine has reached 350 feet.——At the Dead Horse sinking is being pushed to the 1550-foot level.——The shaft on the Providence mine has reached nearly 300 feet.

Yuba.

The Marysville *Democrat* reports the finding of a vein in the Pennsylvania mine at Browns Valley that is 11 feet wide and averages $10 per ton, exclusive of sulphurets. Sixty men are employed. The new vein is on the 800 level.

NEVADA.

The Edison mine, near Dayton, milled ten tons of ore that returned $30 per ton.——The cyanide plant at Pine Grove has begun work on about 20,000 tons of tailings which will average $8 per ton. The 10-stamp mill is crushing twenty tons of ore daily that yields

On May 20th the Johnson-Locke Mercantile Company will dispatch from San Francisco the Steamer "Tillamook" for Dutch Harbor, Nunivak Island and St. Michaels.

This will be the First Steamer Sailing this Season for the North. The Attention of Owners of River Boats Outfitting at Dutch Harbor or Nunivak Island is Called to this Early Departure. As the Space on the "Tillamook" is One-Half Engaged, Early Application for the Remainder is Necessary.

The "Tillamook" will Also Connect at St. Michaels with River Steamers for Dawson, and the Opportunity for an Early Trip up the Yukon River is thus presented. Apply to the JOHNSON-LOCKE MERCANTILE CO., 609 Market St.

from $20 to $60 per ton.——The Winnemucca *Silver State* says that 33,000 pounds of borax were shipped from there to San Francisco, and that the production of Humboldt and Churchill counties this season will be larger than at any previous time, owing to the 2½-cent tariff.

Returns of 750 ounces silver and 4½ ounces gold were the results of twenty-two sacks of ore from the Resurrection mine in Elko county.

OREGON.

J. L. Wright is developing a quartz property near Grants Pass with satisfactory results.——The Lawrence M. Co. are doing extensive development on a property near Leland. A 50-ton capacity mill will be in operation May 15th. Twenty men are employed.——At Granite City the La Bellevue mine has started its new mill on ore of fair grade.——J. Toy has discovered a ledge near Baker City from which mill tests yielded $200 per ton.——The Don Juan is pursuing development with satisfactory results. —— The Golden Eagle struck an ore body of good grade.——The first cleanup of the Oregon G. E. Co. at Ashland was made last week. One of the bricks of amalgam weighed eight pounds. This is a cyanide plant and is pronounced a success on the low-grade ores of that section.

Carpenter & O'Brien have bought the Claiborne mine, near Baker City, for $3000.

The Badger M. Co. shipped a carload of ore from Long Creek to San Francisco.——The Shorty Hope mine at Jacksonville is crushing twenty-four tons of ore per day in a 10-stamp mill.——Van Dorn & Gifiin are developing a quartz property from which mill tests produce satisfactory results.——A 5-foot ledge has been discovered in the Miller mine, near Canyon City, that yields good returns.

WASHINGTON.

A new ore chute was found in the Butte & Boston at Republic that assays $23.46 per ton. The Republic mine is said to have enough ore in sight for two years' work for a smelter of 100 tons capacity daily.——In the Republic No. 2 a ledge was opened that is 14½ feet wide.——At Bossburg a 4-foot ledge bearing gold, copper and silver was discovered in the property owned by the Sulphide M. Co. Assays returned $58.28, of which $17.34 was in gold.——At the Rebate a ledge 6 feet wide has been found that yields from $20 to $26.50 per ton.——At the Blacktail mine an ore body is producing $80 per ton.

Returns for a third lot of ore from the Republic mine are eight ounces gold, seven ounces silver per ton.——On the Lillie mine, after running a crosscut tunnel of 160 feet, a 6-foot ledge was cut that assays from $6 to $48.——The Mineral M. & M. Co. will begin development shortly of their property near Northport.

BRITISH COLUMBIA.

The C. P. Ry. Co. will build a lead smelter of 150 tons daily capacity at Trail.——The Idaho mine in the Slocan is taking out forty tons of ore daily.——Wallaston & Johnson have sold the Hoodoo group, comprising ten claims, near Grand Forks, for $20,000.——The R. F. Burns mine, near Golden, was bonded to an English company for $22,500.——Capitalists interested in the War Eagle have bought the Ben Tillman group for $50,000.——Three feet of ore assaying $21 gold was discovered in the Flossie R. mine in the Salmon river country.——It is said that the ledge in the Three Graces group in East Kootenay is 260 feet wide. It is a free milling proposition, yielding an average assay of $4.90.——The total ore shipments for 1898 from Nelson are 31,654 tons, of an approximate value of $3,010,259.

IDAHO.

F. W. Thornton discovered a 4-foot ledge at Florence.——The Electric M. & M. Co. opened a ledge of good pay ore.——In the Toledo mine an ore body of good value was struck that averages 4 feet in width.——The Golden Star, near Hailey, has a 13-foot vein that assays $47 and the sulphurets average $200 per ton.——Development has begun on Golden Fleece and Golden Star properties, near Idaho City.——Emery & Hall have developed a 40-foot ledge at a depth of 100 feet which is said to be good-milling ore.——Barker & Cartwright and J. Irwin have begun hydraulicking on their claims.

Near Silver City J. C. Bernard is operating extensively in the placer mines of Snake river. His flume and ditch 1300 feet long are fed with water raised from the river by a 35 H. P. engine and 10-inch centrifugal pump, having a flow of 150 inches. The grizzly boxes are 300 feet long, and at their terminus are fourteen blanked covered tables. The concentrates are hauled by rocker covered with plates and then cyanided. About 200 cubic yards of gravel are handled daily.——At the Poorman mine, near Florence, extensive development continues and several hundred tons of ore are on the dumps.

UTAH.

S. Newhouse and associates made the final payment of $107,504 for fifty mining claims at Bingham.——A new discovery of high-grade ore has been made in the Copper King mine, near Logan.——The Sacramento marketed cyanides to the amount of $83,000.——The Niagara M. Co. of Bingham shipped ten cars of ore that showed 35 per cent lead, 10 ounces silver and $2 gold.——A new strike is reported in the Homestake at Silver City. The ore shows antimonial copper and gold. The ledge is 18 inches wide.——Ore has been found at 335 feet depth in the Rabbit Foot mine at Tintic.——The Geyser-Marion at Tintic is crushing 150 tons of ore daily.——The Washington mine at Frisco made its first shipment. ——The Dexter is increasing the capacity of the cyanide plant to a total of 197 tons a day.

The Salt Lake *Tribune* says that the entire battery, sixty stamps, at the Mammoth mill is hung up and the plant closed down. Following this was the suspension of all work at the mine, and the rolling stock on the new East Tintic railway, whose iron connects the mill and mine, is sidetracked and motionless. At the mill the entire force of fifty has been laid off. At the mine over 130 men are idle and all the men employed on the railroad. An officer of the company said it had been brought about by the inability of the company to secure timbers at the mine. When the new management stepped in, among other things done was to enter into a new contract for timbers, that have not yet been furnished. Without timbers the management did not deem it safe to continue, and so the further extraction of ore was abandoned and the men withdrawn. This, of course, necessitated the shutting down of the mill. Another officer of the company said that while a lack of timbers was the immediate cause for the shutting down of the mill, there was another. The latter, he declared, was covered by a vain attempt to run the mill on material of a gross value of $7 a ton, when ore to the value of $9 a ton was necessary to pay the actual cost of operation. The average value of the ore put through the mill in 1897 was $14 per ton, and as long as that average was maintained the plant was made to yield a profit each month. Of the ore bodies in the property, the same director says they are in fine condition, but, in the absence of timbers, the stoping of them cannot be continued.

Six cars of ore were shipped from the Horn Silver.——Another strike is reported from the Bullion-Beck on the 900 level, showing 30 per cent, 20 ounces silver and $3 gold. Of this it is said there are 24 inches. The Bullion-Beck is producing over 2000 tons of ore a month.——The Columbia reports ore that shows over 200 ounces silver and a small amount of gold.

Nearly 10,000 tons of ore have been marketed by the mines of Park City the past ninety days. Of this amount the Silver King has furnished 75 per cent. The output of this property will reach 2500 tons a month.——The Anchor, with its concentrates and crude ore, is averaging 500 tons a month.——T. G. Merrill begins development on the Gracie group at Silver City, and will also continue prospecting on the Daisy and Omaha on West Dip, and also on the Vanderbilt group.——Ore shipments from Park City for the past week amounted to 1,456,760 pounds.——From Silver City twelve cars of ore and one car of talc were shipped.——One carload was shipped from the Washington mine at Frisco.

MONTANA.

The Ruby mine at Basin last week shipped five carloads of ore which netted over $1000 a car.——The Boston & Montana Con. C. & S. M. Co. has incorporated under the laws of New York, with a capital of $3,750,000. The Boston *Post* says that the action of the Boston & Montana people is the decisive step toward the consolidation of the Boston & Montana and the Butte & Boston mining companies. No such consolidation could be brought about under the existing Montana laws. The original Butte & Boston M. Co. embraced about as many properties as it was permissible under the laws of Montana for any one corporation to control and operate, and it was with an eye to a possible future consolidation with the Boston & Montana that the reorganized Butte & Boston was incorporated under the broad statutes of the State of New York.——The Queen of the Hills mine at Neihart is making weekly carload shipments. ——Work is to be resumed shortly on the Bimetallic properties.——The Cooper mine, near Townsend, has discovered an ore shoot of good values and shipments to the smelter have begun.

The *Inter-Mountain* says that one of the most encouraging signs of the times in that district is that more development is in progress at the mines than at any previous time in the history of Butte. New copper properties are being opened and several of the old producers are being developed to greater depth.

The Green Mountain shaft is rapidly reaching the 1800-foot mark. It is reliably reported that at the 1700 level a vein of high grade copper ore was cut. The shaft will be sunk to the 1800 and then crosscuts will be run.

The Parrot Co. started work on the Bellona and a deep shaft will be developed.——At the Little Minah, another of the Parrot properties, the shaft has reached 600 feet.——The Speculator shaft has reached 850 feet, of which 150 feet is recent work.——The Modoc shaft of the Anaconda Co. is being put in order again after a long shut down.——At the Boston & Montana properties much development work is in progress. The West Colusa, with its ore reserves from the Comanche, is in better shape for the production of ore than at any time.

The Columbia mine at Pipestone is developed to a depth of 300 feet, and has 1600 feet of drifts. The ore is oxidized iron pyrites and carries a fair percentage of gold. The 10-stamp mill is to be enlarged to twenty stamps. The property is owned by Senator Hoffman of Bozeman.

The Queen mine, near Neihart, shipped two carloads of ore. On the 300 level they have cut 2 feet of ore said to be high grade. The Diamond Hill mine, near Townsend, will resume work soon.

WYOMING.

F. M. Bacon of Plainfield, New Jersey, will build a 25-stamp mill at Grand Encampment, on which construction will begin soon. This will be the first custom mill that the Grand Encampment district will have. Douglas & Adams' mill devotes its entire capacity to ores from the Northern Belle mine. The new mill will confine itself to the handling of ore from the Golden Eagle and Whippoorwill mines.——Two shifts are working on the property owned by the Philadelphia G. M. & R. Co.——An 18-inch vein of fluorine-stained quartz has been opened on the Isadore lode. The highest assay obtained was $164 in gold and a general average taken returned $42.40. J. H. Graham and W. E. Palmer own the property. Ore is being sacked for the initial shipment.——Farrel & Bush have located a group of copper prospects near Grand Encampment and two shafts are being put down on leads of copper carbonates.——Work will be resumed May 1st on the Portland copper and gold property, owned by J. Ledbetter. Thirty men will be employed.——The Grand Encampment Co., a Cleveland, Ohio, corporation, is advertising for bids for the development of its Blue Belle property and the deepening of its shaft, in which copper and cobalt have been discovered.

M. Maloney has discovered an ore body of fair size near Laramie that yields copper and gold assay values.——Jones & Andrews will begin development on a group of claims near Atlantic City.——In the Caribou mine, near the same place, a 2½-foot ledge yields $30 per ton.——In the Big Mag mine a vein has been opened between 2 and 5 feet wide.——The Flynn Co. will resume work without delay. Their ledge is 5 feet wide and assays $8 per ton.

SOUTH DAKOTA.

The St. Elmo mine, near Hill City, started its new mill and is treating thirty-five tons of ore per day.——The Lizzie, near Deadwood, is pushing development. The vein is 10 feet wide, with a 2-foot copper bearing streak.

MINNESOTA.

The Ferguson mine, near Rainy Lake, has resumed operations.——The Olive G. M. Co. have installed a compressor plant. After some further development work a 1-stamp mill will be erected. W. A. Preston is Supt.

WISCONSIN.

The Oliver M. Co. expects to take 800,000 tons of ore from the Norrie group of iron mines.

ONTARIO.

(Special Correspondence).—The Golden Star M. Co. (Limited) of Ontario have reached a depth of 227 feet in their shaft No. 1. The Golden Star quartz carries a large percentage of metallic iron. The company will put in a 40-stamp mill next fall. They expect to have reached a depth of 400 feet by that time. Fifty men are employed.

At the Foley mine they have reached 450 feet in the north shaft. Solid quartz covers the full width of the shaft at this depth.

Duluth, April 13th, '98.

The Stella mine, near Rat Portage, has three shafts, each on a vein from 4½ to 5 feet wide.——The Mascotte mine at a depth of 200 feet has discovered an ore body of good value.

Seine River, April 15th, '98.

COLORADO.

The Shurtloff mine, near Cripple Creek, is under bond to the Prudential G. M. Co. of Chicago for $75,000. The property has a 7-foot vein. Assays run as high as $85 per ton. ——Stark & Whiteside have a 5-foot vein that runs from $20 to $345 per ton. The output last month was 120 tons.——The Elkton people ask for estimates for a mill to treat low-grade ores.——Hanlon & Wigand have taken a lease on the Summit claim for eighteen months for $80,000.——Ouray shipped 214 cars of ore during March—an increase of 44 cars over February.——The Virginius at Eldora is making weekly shipments of a good grade of ore.——In the Appanalis a 2-foot vein was discovered that averages $40 per ton.——At Leadville the Oro City claim has reached 425 feet depth; the last 70 feet are in quartzite stained with zinc.

At Central City the Pittsburg mine has reached a depth of 300 feet and is making regular shipments.——At Eldora a rich find was made in the Spencer Mountain mine. The mine has a 3-foot vein of tellurium ore.—— The Baldwin mine, near Central City, made a shipment of $50 ore.——In the Cardigan mine at Idaho Springs the pay streak has been opened for 700 feet. Of this some is smelting ore of high grade and the balance is milling ore that will run $8 per ton. A payment of $25,000 was made on the purchase price of the mine.——The Mascott at Georgetown made a shipment which ran 22 ounces silver, 1.44 ounces gold and 7 per cent copper. ——The Democrat Mountain made a shipment that returned 41 per cent lead, 14 ounces silver, 1-10 of an ounce gold.——The Centennial mine, on the 600 level, has 450 feet drift all on ore giving 9 ounces gold, 65 ounces silver and 7 per cent copper.——At a meeting of the directors of the Elkton Con. at Cripple Creek, Bernard was authorized to ascertain at what figure the company could build or buy a suitable mill to treat the company's ores.——The Denver *Post* announces the sale of the Black Diamond group at Silverton to the Iowa G. M. & M. Co. for $100,000. This property has a vein varying from 6 to 11 feet in width carrying a body of lead ore.

The Zeolite is outputting one car a day of ore that runs $25 a ton.——The Gold Hill tunnel has reached 3100 feet at the Anchoria-Leland and the shaft 650 feet. The tunnel will be pushed through the Anchoria-Leland properties.——The Morning Star has a 3-foot vein that runs $28.——The Victor is sending out 100 tons of ore a day. The high-grade is divided into two classes; one averaging $250 and the other $80 per ton. This property has paid nearly $1,000,000 in dividends.——The Anaconda is outputting thirty tons a day.—— The Half Moon's production last month was over 1000 tons of an average grade of $45 per ton.——The Orphan Belle has completed considerable deadwork and added machinery and surface improvements. Ore will be taken from the 300-foot level which is in new ground. The property comprises thirty-four acres and was purchased for $300,000.——The Strong mine, at Cripple Creek, has shipped within the last few months an aggregate of 300 tons per day and arrangements are perfected to increase this product. The Denver *Mining World* says it is stated on good authority that 90 per cent of this ore is high-grade smelting ore. The Florence & Cripple Creek railway has been taxed to its utmost capacity to furnish cars for transportation of the ore.——The Goldsmith, at Ohio City, is shipping ore that runs from $100 to $200 per ton.——The Portland produced last year 18,852 tons of ore of a gross value of $62.47 per ton which netted the company $993,639.——A shipment of eleven tons of ore from the Moore netted five ounces per ton.——Gaffney Bros., at Cripple Creek, made a twenty-ton shipment of $50 ore.——The output of the Pauper last week was forty tons of $50 ore.——Crawford Bros. shipped twelve tons that netted $70 per ton.——Ore from eight different shafts on the Specimen last month amounted to 200 tons.——The *Telegraph* says that the Potvin and Vane lease, on the Christmas, has a weekly production of 100 tons of ore that averages better than $40, and some fifteen carloads have been settled for at better than $60 a ton. Production from the lease has been steady since early in February. Potvin and Vane had to prospect for seven months before they found the ore, but are making up for lost time, and with another level opened will easily double their present production. The ore is in no place less than 5 feet wide and occasionally 10 feet is broken in order to get both walls.

The Sedalia at Leadville is producing fifty tons of ore per day.——At the Bachelor mine, near Ouray, sixty-five men are employed. A vein of high-grade ore was recently discovered and the mill will be ready to make shipments so soon as the roads improve.——C. H. Nix is taking out a good grade of ore and employs twenty-five men. The average product is about forty tons per day.——At the American Nettie a car of first-class ore per day is the output. The mine gives employment to sixty men.——The Wedge has reached 450 feet depth in a body of fair-grade mineral.—— At Cripple Creek the Vaugh & Christian lease shipped 100 tons the past week.

On the Independence, near Silverton, work is progressing and upwards of a half ton of $50 ore is broken daily.——Tandy & Co., near Spanish Creek, are working 6 inches of high-grade ore.——The San Juan M. & M. Co., at Silverton, will begin work on their property May 1st.——In the Tom Moore, near Eureka, was discovered an ore body at 200 feet depth returning gold, silver and copper aggregating $100 per ton.——In the Alda, near Silverton, a vein was discovered that runs $18 gold and forty ounces silver.

ARIZONA.

The importations of copper during March through the Nogales custom house amounted to 7,665,784 pounds, valued at $554,084.——The King of Arizona mine, near Yuma, has reached a depth of 600 feet. The twenty stamps are in constant operation.——J. W. Gerritt has purchased the old Metallic Accident mine, near Kingman, and will soon resume work on the property.——Clack & Poland shipped twenty tons of ore from the Oro Plata mine.——O. F. Kuencer has resumed work on the Esmeralda mine.——S. G. Thompson is developing a property near Klondike that carries from one to two ounces gold per ton.——The Sterling Placer M. Co. has begun work on a large scale on the Hassayampa river.——At the Azurite mine they have a lead on the 200 level that is 15 feet wide.——The Mojave County *Miner* says that the 500 H. P. engine for the Temple Bar Con. M. Co. has arrived, and two steel cables 1200 feet in length were sent to the river to be used in connection with the ferry boat. Another large cable will be used in conveying wood across the river to the big pumping plant. The pumping plant, when completed, will deliver 1800 miners' inches of water at a height of 200 feet, a volume sufficient to handle 6000 cubic yards of gravel daily.

The King of Arizona mine will put in a cyanide plant.——The new Vulture Co. contemplate putting up a 40-stamp mill.

The Guijas G. M. Co. at Oro Blanco are pushing development with satisfactory results. At a depth of 100 feet an ore body of pyrites was discovered that carries a fair percentage of gold. Two hundred tons of ore are on the dump.——At the Golden Star a tunnel has been driven 250 feet along the ledge. A sample of five tons gave an average value of $35 per ton.——Development on the Velvet group continues with satisfactory results.—— Development has begun on the Black Diamond mines—a copper property—near Tombstone. These are under bond to N. O. Bagge of New York.

NEW MEXICO.

The Cochiti M. Co. at Bland has bonded six claims and agreed to expend $30,000 in development work.——The Lake Valley mines shipped 4000 tons of ore this year.——Sixty tons of concentrates are delivered daily at the Pacific mill in Silver City.——The Simpson smelter is turning out nine tons of copper bullion every day.——The Alhambra has been unwatered and is being retimbered. This is a silver property.——The Standard, after a suspension of work for two years, has resumed operations.——The Black Horse mine, in the Moreno district, has 2000 feet of development work. The ore yields from $10 upwards.—— The Grand View has 600 feet of development work.——The Indiana, on which development is being pushed, shows a pay streak of about 20 inches which assays from $30 up per ton. ——The Galena and American Flag properties, near Elizabethtown, show a fair grade of ore. The Moreno, of the same group, is shipping the high-grade ore and milling the low-grade.——The Hidden Treasure has begun a shaft that will be sunk 500 feet.—— Work on the Lexington is being pushed with satisfactory results.

Active development work is in progress on the Jumbo group, near Elizabethtown.——The Frazer copper property at 300 feet depth has a 4-foot vein that averages $45 in gold, silver and copper.——The Confidence mine is taking out eighty tons of ore per day and milling it at Whitewater.——The mines at Hillsboro since the beginning of the year have taken out 2660 tons of ore.——Work will be resumed shortly on the Golden Era group.

AUSTRALIA.

The Bendigo gold mine has reached a vertical depth of 3350 feet and is still going down. Some almost barren zones have been penetrated, but good ore was found beneath each barren zone.

—WORKS:—

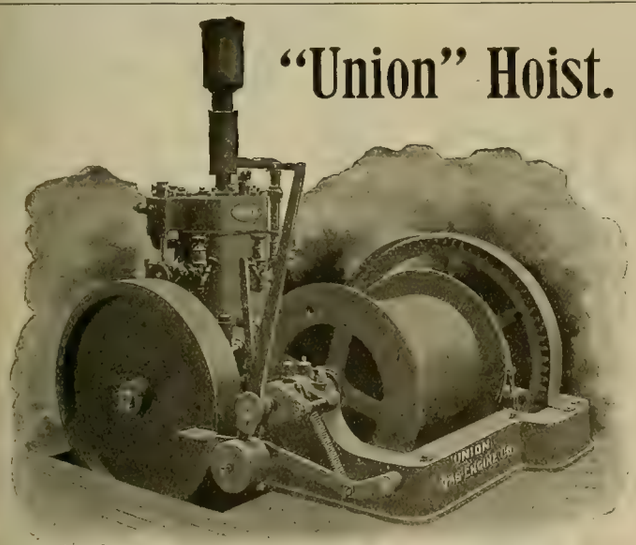
Cor. 36th and Wazee Streets,
DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant



SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

The Pelton Water Wheel Company

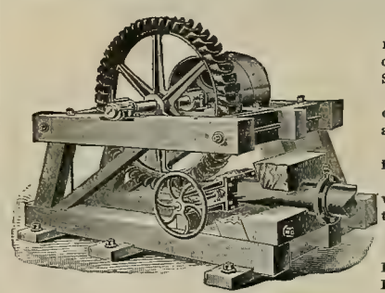
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

KNIGHTS' WATER WHEEL.

The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel** of which there are **hundreds in use** in different States of the Union.

These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**

Address all communications to **KNIGHT & CO., Sutter Creek, Cal., or, RISDON IRON WORKS, Agents, San Francisco, Cal.**

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend itself to all mine owners and mill men.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $5,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

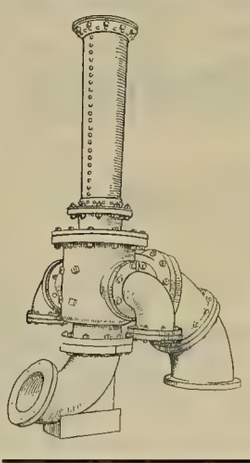
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.



One of these machines will take the place of two or three b concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used Gold Mills:

1. It will successfully handle three or four times more mater than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, a catch any float gold, amalgam or quicksilver which may esca from mortars or plates.
3. It will make cleaner and much more valuable concentrates, th saving useless expense for transporting valueless material, also extra cost for treatment.
4. It requires little or no attention when once adjusted and no e pert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first co of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicat machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of ma rial can be worked, which is not true of any style of belt m chine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

Market Reports.

The Markets.

SAN FRANCISCO, April 21, 1898.

The solidest stocks and bonds, national and local, have suffered depreciation this week. The departure of troops, the extreme likelihood of war and the popular flutter are evidently being worked for all they are worth by those whose motto is, "buy when they are cheap and sell when they are dear." Government 4's and gas and street railway stocks are alike affected. It is probable the closing week of a momentous month will see a further drop, and then the swing of the pendulum will send prices the other way.

Local wholesale prices are stiffer. Everything in the way of provisions is higher because of the drouth. There is little change to note in staple miners' supplies outside of provisions.

London and New York report silver 26d and 56c, respectively.

The bureau of statistics of the Treasury Department reports imports and exports of the United States of gold, silver, etc., for the month and nine months ended March 31st, respectively: Exports of gold coin and bullion, $658,834—$13,516,619; imports, $30,200,265—$66,510,962; excess of imports, $29,541,431—$52,994,343; exports of silver coin and bullion, $3,995,818—$42,468,739; imports, $445,352—$9,098,456; excess of exports, $3,550,466—$33,370,283.

By the time this is in print it is almost certain that actual hostilities will have begun between this country and Spain. That nation will be wiped from the Western map and the United States enters on a policy which opens a new era.

Mining Share Market.

SAN FRANCISCO, April 21, 1898.

Mining stocks during the week shared in the general depression occasioned by exciting war news. There is practically no business. The official letters from the Comstock justify higher prices, but it is not the first time that the condition of the mines themselves had very little to do with the prices at which the stocks sold. In the New York *Financial News* N. Wertheimer, Vice-Pres. Standard Con. Mining Co., suggests: "In view that in case of hostile demonstration being undertaken between the United States and Spain, many of our low-priced railroad securities may for a period remain inactive, would it not be wise for investors to turn their attention to many of our well known and honestly managed gold and silver mines which are listed on our several stock exchanges, and that are being properly worked both in California and Colorado, and are now giving fair returns on the money invested? Although the illegitimate mining of the past has left its traces, and many a wildcat or assessment proposition is still flaunted before the public, mines and different mining methods of to-day have taken on a different aspect and are being run by more competent men, who are pursuing honest business tactics, and it would be well for the investor to study his opportunities and pick out amongst the greater number mining securities that have merit and a chance for future enhancement."

Working Capital for Mines.
PACIFIC EXPLORATION COMPANY
Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.
Money loaned mines.
Mining companies organized, their property experted, financed and managed.
Mines, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated
Examine mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

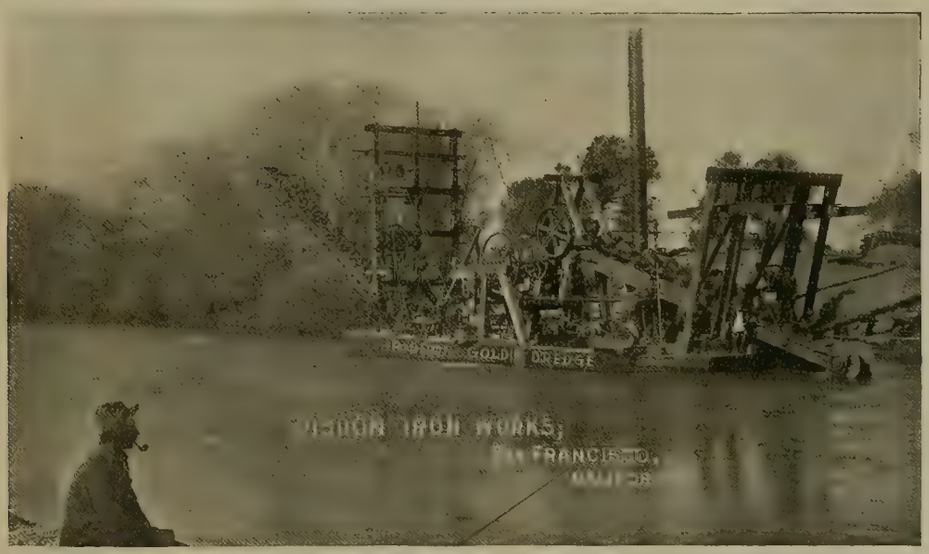
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.



AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1973.—VOLUME LXXVI. Number 18. SAN FRANCISCO, SATURDAY, APRIL 30, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Concrete Superstructure U. S. Government Breakwater, Cleveland, Ohio.

A Government engineering work of some magnitude is in progress at Cleveland, Ohio, where a breakwater 8200 feet long, to enclose that harbor, was completed by the U. S. Government in 1883. It is constructed entirely of oak cribbing, ballasted with stone. A large part of the timbering, especially near the water line, is in bad condition, and in the report of the engineer in charge in 1896 it was recommended that the work should be repaired by cutting away the old cribbing to a depth of 3 feet below water level and building thereon a substructure of Portland cement concrete. This work was begun last fall and is now being pushed. The Medusa brand of Portland cement, made by the Sandusky Portland Cement Co. of Sandusky, O., was selected by the Government engineers. It is estimated that nearly 80,000 barrels of cement will be required to complete the structure.

The method of construction followed is to make blocks 4x4x10 feet in size of concrete composed of Medusa Portland cement 1, sand 2, gravel 3, broken stone 4. These blocks are made in plank moulds on the piers. When finished they weigh about twelve tons each. After hardening two weeks the moulds are removed and the blocks used like blocks of natural stone, their strength being greater than stone while their cost is not more than one-fourth as great. Fig. 1 shows the blocks lying on the breakwater where they are made, also the floating crane used for placing the blocks in position. Fig. 2 shows the operation of lowering the blocks into place on the old cribbing, cut off below the line of decay. Fig. 3 gives a nearer view of the same and shows how blocks are held and lowered by means of the lifting crabs employed.

After one tier of blocks has been placed in position, bringing the surface foot above the water level, the structure is continued by erecting boxes of plank the full width of the breakwater, and packing concrete into these so as to form a solid mass. Alternate sections of convenient width are first filled, and after hardening, the planks are removed and the intervals filled in the same manner, in just about the same fashion as concrete walls and foundations for houses are built in San Francisco.

FIG. 1.—FLOATING CRANE AND CONCRETE BLOCKS LYING ON THE U. S. BREAKWATER, CLEVELAND, O.

Fig. 4, on page 465, shows a section nearly filled, and crane just about to dump another load of concrete. Fig. 5, on page 465, shows a section of the breakwater nearly completed with concrete parapet erected on the main structure. An experimental section of the work, about 200 yards in length, was completed in the fall of 1897. The results of exposure to an Ohio winter were satisfactory, and the work will be completed in accordance with the plan above described. It is expected that the whole structure will be completed by the end of 1899. The estimated cost of work, including repairs to the piers, is $860,000.

For the illustrations accompanying this description we are indebted to the courtesy of our live contemporary, *Cement and Engineering News* of Chicago, Ill.

San Francisco, April 30, 1898.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

THE Federation of Miners of the West propose establishing a home for aged and broken-down miners. The building is to cost $50,000, and the intention is to have the institution supported by the miners' unions of Arizona, Nevada, Montana, Utah and Colorado. Carson and Virginia, Nev., are talked of as suitable locations. A similar idea has been affirmatively acted upon by the California State Miners' Association, but has not as yet assumed tangible shape.

WHEN the battle ship Maine was sunk in Havana harbor Feb. 15th every American knew that meant war. But we were not ready. In two months tremendous efforts have revolutionized our fighting condition, and with cool courage the nation has been put in proper trim for fight. And now is sounded forth the trumpet that has never called defeat. The next few weeks will change the political map of the Western Hemisphere, forever removing the Spanish flag from the Antilles. The war will have a stimulating effect on the mining industry of the nation, as there will be an increased demand for nearly every mineral product.

SOME one who has given the matter considerable attentive detail figures that it last year cost 90 cents to produce a dollar of gold in California, and that the same amount produced in Alabama cost $3.05 and in Wyoming $5.56. It is also stated that in Colorado it cost but 50 cents to produce a dollar, and in Montana 45 cents. These figures are never authentic and rarely trustworthy. It has been assumed by those who have given the matter considerable attention in every age, and in every nation and community, that every dollar of gold produced cost a dollar. This rule probably holds good in all localities, except the Klondike, where each dollar produced probably costs $5, leaving out the immediate loss of life and the slower suicide of thousands more.

IN connection with the conflict between Spain and this country results another fight of some significance, namely, one between medical science and the yellow fever. The United States Army medical corps has organized to fight that foe, and looks forward with the same hope of victory entertained by the soldiers to vanquishing the scourge of yellow fever when our troops are exposed to its contact. One of the most effective measures relied upon in this instance is the erection of a distilling plant, the daily capacity of which will be 100,000 gallons of water, at Key West, and the construction of steel tanks whereby the water may be carried to the fleet wherever the army or navy go, the idea being that the furnishing of pure water will go far toward prevention of yellow fever. Some anxiety has been felt regarding the possibility of a yellow fever epidemic, resultant upon the return of troops from Cuba carrying it back to this country; but the medical corps say that, with the precautions they are adopting, such a contingency is very remote. At Key West are being established hospitals for the use of United States troops, and the fever is looked upon as furnishing as good an opportunity for a victory for science as for the more noisy fighters by land and sea.

"Contraband of War."

The story of a coal famine in San Francisco need not cause much worry for the present, even if the article has been declared a contraband of war. No one believes that the war with Spain is to last very long. A naval war must of necessity be of short duration. When the fleets of the United States and Spain clash, the work of capture or destruction will be quick and decisive. A more serious complication is the little inducement to send ships to San Francisco this year on account of the poor outlook for grain cargoes. But even if California should have no grain for export next summer and fall, the large number of ships that will be required for Oregon and Washington will compel a large coal fleet to come to the coast, and thus there is a good prospect that we shall have the usual supplies of European and Australian coal. Besides, the coal supplies of this coast are quite adequate to our wants without a cargo from other places.—S. F. Bulletin.

Coal has never been definitely decided upon as a fixed contraband of war, although this country passed a law in May, 1862, declaring it so. Prior to the civil war there never had been necessity for agreement upon coal. International lawyers are divided upon this point, but generally admit that as England has recently declared coal to be contraband other nations will take like action should occasion arise.

Chief Justice Chase ruled that contraband goods are divided into three classes: First, articles manufactured for military purposes; second, articles which may be used for war or peace, according to circumstances; third, articles exclusively used for peaceful purposes. In order to constitute contraband of war it is necessary that there should be hostile quality and a hostile destination. Where non-contraband articles are part of a cargo with contraband goods, they may be seized. Collectors of customs may refuse clearance papers to ships of any nation destined for enemies' ports.

The following articles are recognized as contraband of war: Cannon, firearms, rosin, sail cloth, clothing for uniforms, hemp and cordage, ship lumber, tar and pitch, ardent spirits, iron, lead, copper, tin, brass, wire, platinum, horses, printing presses, paper, postage stamps, sulphuric acid, zinc, marine engines and like machinery.

Provisions sent to belligerents are not in general deemed contraband unless destined for military use. Corn, flour and meal are only contraband in siege, blockade or investment. Money sent to belligerents for payment of goods purchased is not contraband, but is if sent to assist belligerent operations. Cotton was considered contraband during the civil war, as it was used as collateral.

IN Denver, and elsewhere in Colorado, it is seriously suggested to abolish the mining stock exchanges of that State, or at least suspend their operations for a time. Abuse of privileges, selfish and at times dishonest manipulation of stocks go far to justify such a feeling among those who believe in working the mine, and not the street, on the ground that such action on the part of mining brokers is inimical to the true mining interests of the community. But because of the abuse of such an institution, its manifest advantages should not be overlooked. Rightly managed, a stock exchange is of value as the central barometer of and readiest market for mining stocks. There is a recognized value to many mining stocks and there should be a recognized center for transactions therein. In this case it would seem that it is not abolition but reform that is most needed.

California's Gold Yield for 1897.

Through the courtesy of Charles G. Yale, statistician of the U. S. mint at San Francisco, the following is published herein:

The superintendent of the U. S. mint in this city has forwarded to the director of the U. S. mint at Washington the report on the product of the precious metals in California for the calendar year 1897. This report is based on the returns received from producers in answer to inquiries sent out from the local mint. As compared with figures obtained from the same source in 1896, the gold yield of the State shows a falling off of $1,310,161, while the silver shows an increased product of $30,325, commercial value, making the total decrease for the year 1897 from the preceding one $1,279,830. The yield of the State by counties is as follows:

PRODUCT OF CALIFORNIA BY COUNTIES, 1897.

RECAPITULATION.

County—	*Gold.*	*Silver.*	*Total.*
Amador	$ 1,324,473	$ 3,477	$ 1,327,950
Butte	667,025	7,885	674,910
Calaveras	1,439,861	1,745	1,441,606
Del Norte	16,710	.....	16,710
El Dorado	674,626	886	675,512
Fresno	43,144	.....	43,144
Humboldt	94,992	57	95,049
Inyo	159,840	50,063	209,903
Kern	754,313	10,471	764,784
Lassen	49,100	850	49,950
Los Angeles	40,698	.....	40,698
Madera	85,963	.....	85,963
Mariposa	451,427	660	452,087
Mono	520,101	72,491	592,592
Nevada	1,885,251	8,116	1,893,367

San Bernardino	100,373	54,407	154,780
San Diego	592,328	.....	592,328
San Luis Obispo	2,500	.....	2,500
Santa Barbara	3,000	.....	3,000
Shasta	569,071	96,869	665,940
Sierra	370,208	46	370,254
Siskiyou	842,123	34	842,157
Stanislaus	37,392	.....	37,392
Trinity	1,078,372	259	1,078,631
Tulare	12,830	214	13,044
Tuolumne	1,809,572	1,696	1,811,268
Yuba	141,638	.....	141,638
Undistributed	.....	131,073	131,078
Totals	$15,871,401	$452,789	$16,324,190

In 1896 there were seven counties of the State which produced over a million dollars, and one of these yielded over two millions. In 1897 there were but six of the million dollar counties, and none of them reached the two million mark. Nevada county, which held the place of honor in 1896 in bullion product, still maintains its position in 1897; but Tuolumne county, which ranked No. 7 in 1896, takes second place this year, displacing Placer, which is now third on the list. Calaveras, which was third, is now fourth in rank. Amador also drops back one place, being now fifth instead of fourth. Trinity, which was fifth last year, is sixth in 1897, holding the place that Siskiyou did the previous year, the latter county dropping out of the list of million dollar producers for the time at least.

Investigation has been made into the origin of bullion—whether from alluvial washings or veins. It is found that vein mining very greatly leads not only one but all forms of gold washing combined. The figures for California in 1897 are as follows:

Quartz mining, $11,390,130; surface placers, $2,379,914; hydraulic mines, $1,351,088; and drift mines, $1,203,058. In the quartz total is included the silver output of $452,789 (commercial value). From copper ores (included in the quartz column) the product of gold was $149,406, and of silver $95,928. From the silver-lead ores, mainly in Inyo and Mono counties, the gold product was $44,801 and the silver $54,100.

Deducting these amounts of silver derived from the lead and copper ores, the remainder of the total was obtained by separation from the gold derived from quartz, placer, hydraulic and drift mines—that is, of the total gold, $194,207 was derived from copper and lead ores and $150,028 silver was derived from the same source.

Figures collected by the Mint also show approximately the number of men engaged in precious-metal mining in the State for the year 1897. The number given is 16,783, as compared with 16,790 in the previous year.

Magnetic Concentration of Ores.

Considerable space in this paper has been devoted to notice of the magnetic concentration of ore in New Jersey, and more recently is noted preparation for what is said to be "magnetic" reduction of gold ore to be operated by Mr. Edison on a large scale in New Mexico.

There is something attractive in the subject, and it is receiving considerable present attention. In the March number of Cassier's Magazine is an article on the "Magnetic Concentration of Ores," by Prof. W. A. Anthony, which gives much of technical value. He cites some of the earlier forms of magnetic separators, necessarily crude, for, as he instances, until the invention of the dynamo machine reduced the cost of electrical energy, inventors and users of such separators generally had to content themselves with such results as could be obtained by the use of permanent steel magnets.

A few magnetic separators have been constructed in which the magnetic poles are placed in the passing stream of mixed materials. The magnetic particles are arrested by the magnets and gradually accumulate upon them. This accumulated material must then be removed from time to time; otherwise the magnets would become overloaded and would no longer perform their office.

Such a construction, says Prof. Anthony, could not be used, except where the quantity of magnetic material is very small. Where considerable magnetic material is present, the separator must be so constructed that it may be continuously removed. While such separators are all constructed upon the same underlying principle, as stated above, they may be roughly divided into two classes: one in which the mixed material is carried around, or in front of, the poles of a magnet and in which the magnetic portion is deflected from its course sufficiently to be deposited in a receptacle by itself; and the other in which the magnetic material, spread out upon an apron or similar carrier, passes in front of a magnet which picks up the magnetic portion, which is then, by the movement of the magnet itself, or by means of a supplementary carrier, removed to the receptacles provided for it.

Separators of the first class have taken various forms. In Fig. 1 the material to be operated upon,

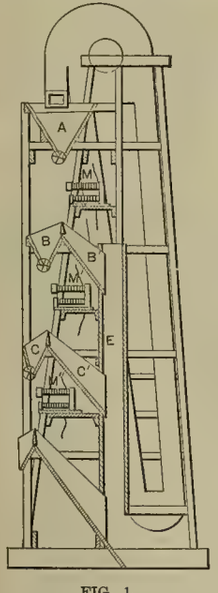

FIG. 1.

in the form of coarse powder, having been passed through a sieve to separate all stones and lumps, is conveyed to the hopper *A*, from which it falls in a thin sheet in front of a magnet, *M*, which is so adjusted that it merely deflects from its course, but does not attract to itself, the most strongly magnetic material. This then falls into the chute *B'*, while the undeflected portion falls into the hopper, *B*, from which it drops, in a thin sheet, in front of the magnet *M'*. The latter is so adjusted as to act upon magnetic material that is too weak to be drawn by the first magnet and so produces a further separation. The material which passes *M'* without deflection goes into the hopper *C*, and is then subjected to a further separation by the magnet *M''*.

More than one magnet is necessary in this apparatus, because if the first magnet were placed sufficiently near the falling sheet to take out all the magnetic material, the strongest of this would be so strongly attracted to the magnet and cling to its face.

Fig. 2 shows two views of another form of separator of the first class. Here the two cylinders, *B* and *B'*, are supposed to be rendered strongly magnetic by means of the horseshoe magnets marked *AA*. With such a construction the greatest strength would exist in the region between the two cylinders

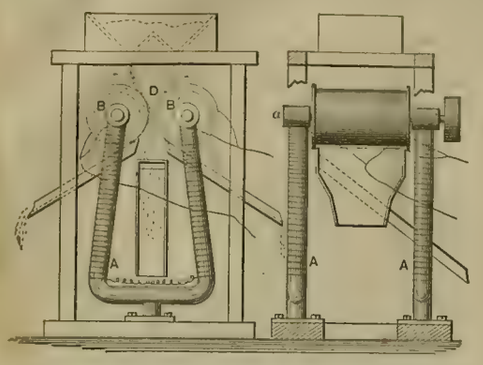

FIG. 2.

where they most nearly approach each other. From this point the magnetic strength would grow rapidly less as the cylindrical surfaces recede from each other, until a point would be reached where it was no longer sufficient to retain the magnetic material which would then be deposited as the figure shows.

Figs. 3, 4 and 5 represent a separator of the second class. The magnets *G*, having plates *F'* to serve as poles, are supported above an apron, *D*, upon which the mixed material is spread in a thin sheet. As this apron passes beneath the magnet, the magnetic material is picked up and held against the under side of a transversely moving apron, *C*, until it is carried beyond the edge of the apron *D*.

Then, as it leaves the region of the magnetic action, it drops into a receptacle, as shown in Fig. 4. The non-magnetic material remains upon the apron

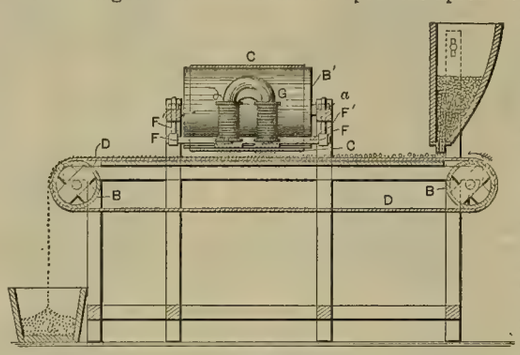

FIG. 3.

D, until it passes over the pulley *B*, when it is deposited, as shown in Fig. 3.

In this form of separator the apron *D* is often considerably lengthened and three or four magnets and transverse aprons follow one another over it, each succeeding magnet being placed a little nearer to the apron *D* than the one that precedes it. In this way magnetic material that has escaped the first magnet may be picked up by the second, and so on.

As already stated, until a very recent date separators have been designed with reference to the removal from a mixture of substances that are quite strongly attracted by the magnet. Indeed, it had not been recognized until very recently that the feebly-attracted minerals were amenable to magnetic separation at all. The magnets represented in the separators so far described would not at all answer the purpose of removing these very feebly attracted substances. Why attempts were not made earlier to attract upon the feebly magnetic minerals will be understood when it is remembered that there are two distinct classes of substances attractable by the magnet with a very wide gap between. Taking the attractability of iron at 100,000, that of magnetite is about 65,000, while the feebly attracted minerals run from 40 to 150, forces which, compared to that of magnetite, are infinitesimal. Of all minerals pyrrhotite only is comparable to magnetite in magnetic strength, and even it is much weaker than magnetite. Had there been a regular gradation in magnetic attractability from the substances of the first to those of the second class, it is probable that means would long ago have been found for grading the action of magnetic separators and of developing the strength necessary to deal with the feebly attracted minerals.

But in consequence of this very wide gap unoccupied by substances having an intermediate attractability, practical engineers have not recognized the feebly attracted minerals as exhibiting any force at all. Or, if they knew of the existence of these feeble attractions, it is no wonder that they did not consider them practically available for magnetic separation, when it is remembered that the magnets that successfully separated the recognized magnetic substances would have to be increased in strength from 500 to 1500 times in order to deal with the minerals of the other class.

Some inventors, in order to separate the more feebly magnetic ores of iron, have proposed to convert these ores into magnetite by roasting. But this process, although successful with certain ores, is not always applicable, and, moreover, is costly.

Such a process was employed for separating the iron-bearing minerals from the zinc ores of the Franklin mines of New Jersey and was, to a degree, successful; but the expense of the process led J. P. Wetherill of the Lehigh Zinc and Iron Co. of South Bethlehem, Pa., to institute a series of experiments looking to the direct magnetic concentration of these ores without the preliminary roasting.

To understand the difficulties and discouragements that beset the experimenter, it must be understood that none of the constituents of the ore of the Franklin mines had ever been recognized as attractable by the magnet. The ore is known as franklinite ore, and

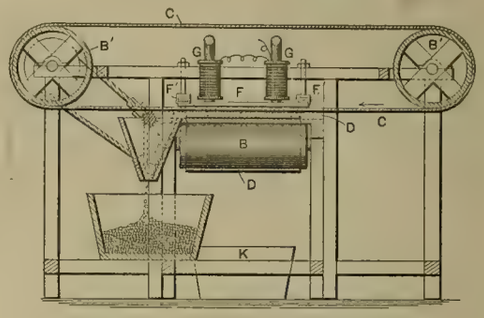

FIG. 4.

is an aggregation of several minerals: franklinite, a mineral containing zinc, iron and manganese; willemite, a silicate of zinc; zincite, an oxide of zinc, together with calcite, garnet, and a number of others. The principal object is to obtain the willemite and zincite free from the franklinite, as the presence of the latter is a fatal obstacle to the reduction of these zinc ores in the Belgian furnaces.

The fact that the franklinite could, by roasting, be rendered sufficiently susceptible to magnetic attraction to be removed by the separators then in use, suggested that it might be somewhat magnetic in its natural condition. But, tested in the ordinary way, it showed no evidence of magnetic susceptibility, and it was only after repeated trials by the strongest hand magnets that Mr. Wetherill found that, now and then a fine grain of franklinite could be lifted out of a mass of powder. This was, however, sufficient to demonstrate the attractability of the mineral, and the problem now was to obtain the magnetic strength required for its separation on a commercial scale.

No assistance toward the solution of this problem was furnished by the then existing magnetic separators. On none of these would any amount of current in the magnet windings give a magnetic strength that would produce any impression whatever upon

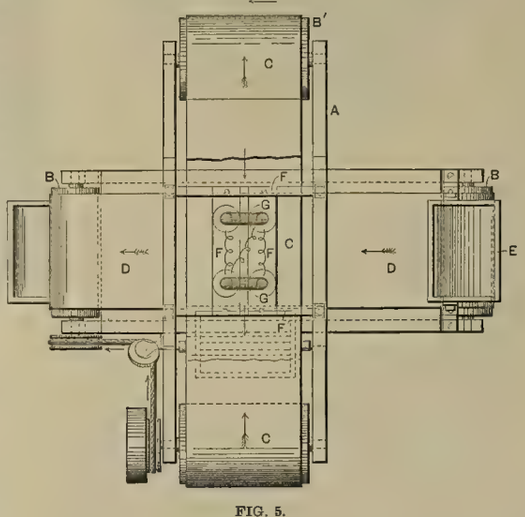

FIG. 5.

the franklinite ore. It was evident that, for obtaining a very intense magnetic field, the design of the magnets in existing separators was radically wrong.

The principles that underlie the construction of electro-magnets may be stated in a few words. A coil of wire carrying a current possesses a power to develop magnetic force which is measured by the product of the number of turns in the coil and the

strength of current flowing in it. This product represents "ampere-turns," and is a measure of the "magneto-motive force" of the coil. Such a coil develops a magnetic force which is assumed to be represented by "lines of force" forming closed curves, linked into the coil. As a further assumption, a line of force is taken to represent a unit of magnetic force, so that the number of lines through a given coil represents the total magnetic effect of that coil, and the number of lines passing through unit area at any point, represents the strength of the magnetic field at that point.

The total number of lines developed by any coil is the quotient of the magneto-motive force of the coil and the reluctance of the magnetic circuit. This reluctance is a quantity akin to resistance in an electrical circuit, and may be considered as representing the opposition offered by the material filling the space occupied by the lines, to having lines of force set up in them. The reluctance of air is high, and of iron, when far from saturation, very low.

An electro-magnet consists of a coil of wire surrounding an iron core usually having a horseshoe form. The magnetic effects are exhibited in the air gap separating the ends of the horseshoe. In order that these effects may be intense, it is necessary that the number of lines per unit area in the air gap should be large.

To obtain a large number of lines requires a great magneto-motive force and small reluctance. To obtain a small reluctance requires a large mass of iron far from saturation by the magnetic lines developed. But to obtain intense effects requires a large number of lines per unit area of air gap. Hence, the area of air gap must be small.

It can now be understood why the early magnetic separators failed to produce a field of such intensity as to act upon the feebly magnetic substances. Referring to Fig. 2, the iron cores of the magnetizing coils are long and of small area; hence, they have a high reluctance. The air gap area is a rectangle whose length and width are at least equal to the length and diameter of the polar cylinders. This area is, therefore, many times the cross section of the magnet cores, and the lines of force which would saturate the cores would be thinly distributed over this air gap.

So with the magnets of Figs. 3, 4 and 5. There are two magnet cores having for common pole pieces the long flat plates, *F*. The effective magnetic field, as shown in Fig. 3, has an area equal to the entire under surface of these plates, which is many times the area of the cross section of the magnet cores.

Even if the two magnets were as close together as possible, and the plates as short as such a distance would admit, their area would still be many times that of the cross section of the cores, and all the lines that could possibly pass through the cores would be but thinly distributed when scattered over the surface of the plates.

These examples show not only no attempt to concentrate the lines of force and so produce intense magnetic effects, but it would seem from them that the purpose of the inventors was rather to distribute the force over as large as possible a region.

Fig. 6, from a patent appearing as late as 1893,

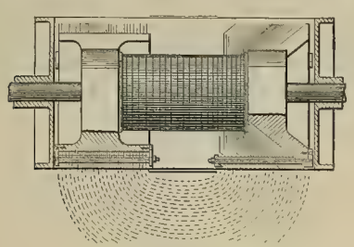

FIG. 6.

shows this plainly. Here the inventor makes his pole pieces of thin sheet iron, set edgewise and spaced at unequal distances with the avowed purpose of obtaining an even distribution of the lines of force over the entire area. Here, again, the air gap area is many times larger than the cross section of the magnet core.

Now, in order to produce that intense magnetic field that is needed to operate upon the magnetic materials of the second class, the course pursued must be the exact opposite of that which the figures referred to exemplify. Instead of small magnet cores and large air gap area, there should be large magnet cores and small air gap area—large magnet cores to reduce the reluctance and permit of the production of a large number of magnetic lines, and a small air gap area through which all these lines must pass, and in which, therefore, they are crowded together, which is the same thing as saying that the magnetic force is intensified.

It was left for Mr. Wetherill to fully appreciate these principles of magnet construction and to apply them in practical form to the construction of magnetic separators. Figs. 7 and 8 show one of the forms which the Wetherill separator has taken. The pole pieces, *C*, are shown to be beveled to a thin, rounded edge, and brought near together. The working air gap is the narrow space between these polar edges, and is, therefore, very short and of small area, the latter being practically represented by a rectangle whose length is $x\ y$, as seen in the horizontal section, and whose width is the thickness of the edges of the pole pieces, as seen in *A* in the side elevation.

Through this very small area pass nearly all the

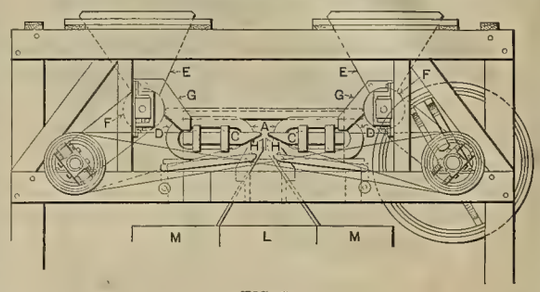

FIG. 7.

lines of force developed by the large magnet coils through the heavy magnet cores and yokes which form the rest of the magnetic circuit, and present a very small magnetic reluctance. It will be noted that the air gap area is here much smaller than the cross section of the magnet cores, instead of being many times larger, as in the earlier separators; and from this results the enormous concentration of magnetic force.

Into and through this intense magnetic field the ore to be acted upon is passed. But all this will be better understood if the complete operation of the

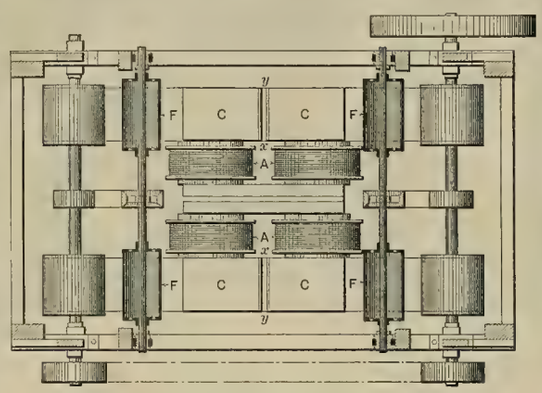

FIG. 8.

apparatus is described. The mixed material in coarse powder, sized by passing over suitable screens, is brought through troughs, *E*, Fig. 7, which is taken from a machine regularly installed for operation, to the rollers *F*. By these rollers the material is fed through the troughs *G*, in a thin layer upon the belts *D*. These travel toward the gap and pass by friction around the rounded edge and along the beveled lower face of the pole pieces, as shown. The material on the belts, therefore, passes directly through the gap at *A*, almost in contact with the rounded edge of the pole pieces, where the magnetic force is most intense.

Material that is absolutely non-magnetic drops vertically from the pole pieces beween the shutters *HH'*, into the receptacle *L*. Material that is at all attracted is carried by the belt partly under the rounded edge, and, if sufficiently susceptible, may even be carried on to the beveled under surface of the pole pieces; but it will sooner or later reach a point where the magnetic force is too weak to hold

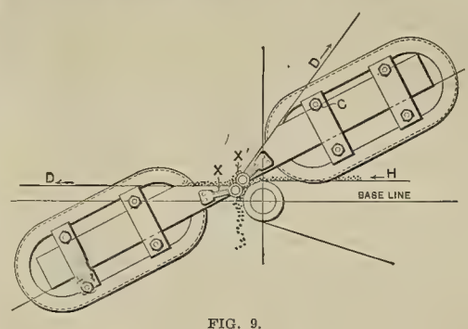

FIG. 9.

it, and it will then drop off. It will, therefore, be seen that by properly adjusting the shutters *HH'*, this magnetic material may be guided into the receptacles *MM*.

The pole pieces in these machines are adjustable, and the air gap, *A*, may be made wider or narrower, thus varying the magnetic intensity. This intensity may also be varied by varying the current in the magnetizing coils. By these means the apparatus may be adapted to the separation of materials varying greatly in magnetic permeability. Indeed, a series of these machines may be so adjusted as to separate from a mixture of materials of varying permeability, first, that of the highest, second, that of the next highest, and so on until the different materials are all separated and classified in the order of their attractibility.

The machine above described is best adapted for dealing with materials in the form of coarse powder. For operating upon material in fine powder a somewhat different arrangement of the magnets is found necessary. Such an arrangement is shown in Fig. 9.

The magnet poles are here inclined, with their beveled faces upward. The finely divided material is brought by the belt *H* into close proximity to the air gap where the magnetic material is, as it were, picked up, most of it going to the rounded ege of the left-hand pole piece, when it is carried by the belt *D*, moving in the direction of the arrow, upward through the gap and to the left over the pulley around which the belt passes.

Some of the material may go to the right-hand pole piece and be carried by its belt a short distance up the steep incline, as shown at *X'*; but the magnetic force very rapidly becomes weak as the distance from the edge increases, and this material soon falls back down the incline, and finally falls over on to the left horizontal belt and is carried away to its proper receptacle.

It will be seen that the separators represented in Figs. 7 and 8 are separators of the first class, in which the material is carried into a magnetic field by which the magnetic portion is deflected from the course it would otherwise follow, while the separator of Fig. 9 is of the second class, in which the magnetic material is lifted out of the mixture and is then carried away by a supplementary carrier.

As has been said, it was the necessity for separating the iron and manganese-bearing minerals from the pure zinc-bearing minerals of the franklinite ore that led to the development of these powerful magnetic separators; but it was soon found that the extraordinary magnetic power that could be achieved by properly designing magnets along the lines pointed out, was sufficient to permit the separation of substances far less susceptible than even franklinite. Hematite, siderite, garnet, pyrolusite and others could be separated from deleterious substances, or from ores in which they are themselves objectionable ingredients. Manufactured salts of iron, manganese and chromium are affected by these machines.

These Wetherill separators are in operation at the Sterling Iron and Zinc Co.'s mines at Franklin furnace, New Jersey, in a plant capable of handling 300 tons of ore per day.

Cripple Creek Milling Facilities.

A conservative estimate places the Cripple Creek ore output at 27,000 tons per month, about 9000 tons of which are shipped to the smelters at Denver and Pueblo, leaving approximately 18,000 tons per month to be milled by cyanide and chlorination. There are seven milling plants in the vicinity which operate almost exclusively on Cripple Creek ores; name and capacity of each being given below:

	Tons per day.
Brodie, cyanide	100
Colorado-Philadelphia, chlorination	220
Gillett, chlorination	60
Arequa, chlorination	75
El Paso, chlorination	100
Metallic, cyanide	300
Kilton, chlorination	30
Total capacity	885

Thus the milling capacity is 26,550 tons per month about equal to the output of the entire district. The smelter consumption of high-grade ores being about 9000 tons per month makes it necessary for some of the mills to run at much less than full capacity, or seek ores from other districts. It is estimated that the mills generally effect a saving of about 88 per cent of the values, and that the average value of mill ore treated is about $25 per ton.

The Brodie, Gillett and Arequa plants are located in the district; the Colorado-Philadelphia is at Colorado City, while the El Paso, Kilton and Metallic are at Florence. Those at Florence and Colorado City use crude oil as fuel, those in the district using coal.

The superior smelting and milling facilities encompassed within a radius of sixty miles makes an open market that constantly assures the producer full value for the product of his mine, and the competitive transportation facilities tend to the same result.

Cripple Creek, April 23rd, '98. WASCOTT.

THE desirability of bringing all scientific facts in relation with a single "international" standard of latitude cannot be too strongly insisted upon. It has often been pointed out that there are many discrepancies in "accurate" statements of boiling temperatures, absolute weights, etc., due to the want of a universal standard latitude, with regard to which "normal" barometic pressure should be fixed.

Treatment of Slimes.

NUMBER IV.—CONCLUDED.

The anode has attracted a good deal of study, but the subject of the cathode is not less interesting and important. Many substances have been tried, which have performed their functions more or less completely. Lead has been used in thick plates, in thin sheets, in ribbons or strips, and in the form of shavings, while zinc has been used in the form of amalgamated plates and as shavings, amalgamated copper plates have similarly been tried, together

FIG. 4.—CRANE DUMPING CONCRETE IN SECTION NEARLY FILLED, U. S. BREAKWATER, CLEVELAND, O. (*See page 461.*)

with iron plates and various other forms of iron; and the same with mercury. Zinc, copper and iron in various forms have been utilized by Mr. Andreoli for this purpose; mercury is in use in the United States in the Pelatan-Clerici process; on these fields at present lead strips and lead shavings are in use; and zinc shavings are used by Mr. Bettel at the Comet. Each of these various cathodes have their peculiar advantages. Lead strips are used every-

FIG. 5.—SECTION COMPLETED AND CONCRETE PARAPET ERECTED ON MAIN STRUCTURE, U. S. BREAKWATER, CLEVELAND, O. (*See page 461.*)

where in the plants using the Siemens process except at the Central Works, where part of the boxes are charged with lead shaving; and at the Comet zinc shavings are in use.

In the actual running or precipitation of the liquid in the Siemens and Halske box, there are only a few things to which it is necessary to give attention. Having set the current and knowing the capacity of the precipitating plant for a certain grade of solution, all that is required for the period of one or two months is at the commencement to see that the connections have been properly cleaned and are in order, then to keep a constant flow of clear liquid through the box, then to see that the same current is maintained throughout, after which no further attention is required. The guide as to when the clean-up should be made is the condition of the cathode. The cleaner the cathode can be kept the larger will be the amount of gold that can safely be precipitated upon it; and the steadier the current is kept, the more solid and perfect will the planting be. So long as the surface of the lead remains clean and the coating regular, so long the precipitation of the gold will take place; but under ordinary circumstances, such as prevail in our precipitating plants to-day, it is not usually advisable to retain the lead in the boxes for more than two months. Possibly, if the lead can be kept clean, three months might be given to the lower boxes, because they are generally cleaner than the upper boxes; deposition of the lime and other substances that tend to destroy the efficiency of the cathode is most apparent in the head boxes.

General Conclusions.—It is but just to state in this connection that the name of Adolf von Gernet will always be associated with the introduction of the electrolytic process in this country, and also that among the practical workers in electro-deposition on the Witwatersrand no name is better known than that of M. Torrente, while G. Andreoli is coming rapidly forward as an electro-metallurgist.

With regard to the future, the present rapid reduction in working costs of slimes treatment, and the increasingly high percentage of actual extraction, make it appear possible that the aim of the metallurgist will soon be to increase the percentage of the slimes produced by the mill rather than to restrict it as in the past. This will involve a continually decreasing average size of concentrate and sand particles, with consequently lower residues and less gold remaining therein, which gold has not been extracted, simply because it is inaccessible both to the action of mercury and cyanide.

We may look upon the slimes treatment as it has been developed in this country by the members of this society as a new metallurgical process, which will be adopted all over the world, and I think that its main features will be practically retained. The use of lime for settlement, the use of spitzkasten for collecting, tanks for "natural settlement," dissolving the gold by means of agitators or centrifugal pumps, the decantation of the liquid, and the precipitation by electrolytic method are, I think, permanent features, which in detail may be modified to some extent, but which will remain with us. I do not believe that any system of vacuum presses, filter presses, or pressure filters of any sort will ever be used in the treatment of battery slimes; in other words, I do not think that any form of leaching will over displace the methods that we have in use at present. It may appear a somewhat complacent way of look at acceptod methods to state that one thinks present methods will not be displaced, but merely expanded. But, nevertheless, it must not be forgotten that every problem has its necessary limitations, and while there may be many startling innovations proposed, the methods that we have before us to- day in actual work are the survival of the fittest of many attempts, in which there are many more records of failures than of successes.

I think that the members of this society may be congratulated on having carried out the truly great work that I have attempted to describe, and much credit is likewise due to the far-seeing capitalists who have had the pluck and determination in the face of many failures to furnish the money which made possible the economic solution of the slimes problem.

A New Explosive.

The *Revue Technique* describes an explosive invented by T. Jewler, named "Promethee," which is manufactured on different lines from the explosives in ordinary mining use, being composed of separate solid and liquid elements in themselves non-explosive and only detonating when jointly combined. The solid portion is made up of the following: Chlorate of potash 56%, manganese dioxide 20%, ferric oxide 24%. This is triturated, mixed in a mill and filled into cartridges, a permeable cartridge paper being employed to facilitate the penetration of the oil, which consists of: Petroleum 50%, oil of turpentine 40%, oil of bitter almonds 10%. This prepared liquid —which is not applied to the cartridges until just before use—is stored in metal flasks holding about one-tenth of a gallon: 2.2 lbs. of the explosive contains 1.65 lb. of cartridge contents and .55 lb. of the oil, this quantity being sufficient to impregnate the cartridge. The cartridges, before they are steeped in the oil, are non-inflammable and non-explosive, even by shock from steel plates. They are, it is said, unaffected by frost, moisture, or sudden changes in the surrounding medium, and do not undergo any change during storage. The oil is not readily inflammable, and, when ignited, burns quietly with a smoky flame. However, when impregnated with oil—which takes about fifteen minutes—the cartridges, on ignition, burn quietly with a brilliant flame, and disengage a large volume of gas. Percussion between two plates of steel will explode them, as will also an ordinary detonator. No other means of causing an explosion is possible, and cartridges fitted with detonators may be placed in the vicinity of others that are being exploded without themselves going off. Moreover, when the impregnated cartridges are dried again, they return to their non-explosive condition. It is claimed that the disruptive force exerted is at least as great as that of dynamite; also that it is directed in the line of greatest resistance, and acts with equal efficiency in dense rock, light-fissured rock, and in water. No soot is left on the walls of the boreholes, and direct experiment has shown that the cartridges may be fired in presence of inflammable or explosive gases like fire-damp without danger.

THE cry of a magician in Aladdin, "New lamps for old!" is matched in a story told by M. Philippe of Paris. It appears that a Russian loan of fifty million francs was taken up by Rothschild in 1836. M. Poizat, a French chemist, discovered that the older Russian silver coins contained a large proportion of gold, and he having entered into relations with Rothschild's, the latter stipulated that the loan should be repaid in old silver. The unsuspicious Czar acceded, the wily chemist recovered the gold from the melted silver, and shared the profit with Baron Rothschild. The Emperor Nicholas subsequently learned the fact and sent for M. Poizat to St. Petersburg to install a similar laboratory to deal with the remaining old coinage, from which expedition the French chemist returned loaded with honors. This recalls the fact that Dr. Emmens makes argentaurum from Mexican dollars, probably of primitive manufacture.

A Montana Tailings Plant.

The Helena, Montana, *Independent* says: C. W. Merrill furnishes a New York paper with the following description of the tailings plant of the Montana Mining Co. at Marysville:

The tailings beneficiated during the preceding summer by the new cyanide plant of the Montana Mining Co., the largest in operation in this country, were taken from what is known as their No. 5 dam. This bed, the lowest of the five situated in Silver gulch, is about six miles below Marysville and contains a much greater proportion of slimes than the upper beds, owing to the fact that it has been largely used for the final settling and clarifying of the water. The first step in the process of treatment, that of putting the material in suitable shape for leaching before loading it into cars, is, therefore, one requiring considerable care. In order that this point may be perfectly clear, it should be explained that in the operation of any plant for lixiviating tailings the material handled from day to day should be as nearly uniform in fineness as it is practicable to obtain it, and also that as few slime lumps as possible should be charged into the leaching vat, because they are not only impermeable to the solution, but soak it up and do not release the values. To accomplish this preparation the bed is plowed, harrowed and worked over continuously in order to dry and partially pulverize the lumps. The further precaution is observed of so selecting the material from different areas on the bed as to give comparatively uniform leaching charges each day. The installation of a disintegration plant to completely pulverize the slimes is now contemplated, and by this means a fixed proportion of pulverized slimes can be added daily to the charge.

The second step, that of loading the cars, is accomplished in the old Mormon fashion, using traps or bridges over railroad cuts and scrapers for moving the material. The pattern of the latter is known as the "Fresno buck" scraper, and the economy and advantage of their use will be appreciated by contractors when it is stated that we have been loading approximately 400 cubic yards per day with six men and twelve horses, with an average haul of not less than 100 feet. The use of the steam shovel in this work is practically prohibited by the fact that the material should be somewhat dried and pulverized on the surface of the bed before loading, in order to secure the best working results.

The cars used are of three tons capacity, with bottom discharge, and sixteen loaded cars make the train for a 22-ton locomotive. The latter is of the saddleback tank type, 9-foot wheel base, with six driving wheels carrying all the weight. The rails are 56-pound Northern Pacific pattern. The gauge is 3 feet, the maximum curve thirty degrees, and maximum grade 3.5 per cent.

The plant is two and a half miles above No. 5 dam, and the tailings after leaving the cars pass in an almost continual stream to the sheet iron lining of the bins and out of the gates to a 24-inch four-ply belt conveyor, which conducts them to a revolving chute or distributor; and this in turn fills a vat 38 feet in diameter by 9 feet deep with 400 tons of tailings in about eight hours. The great advantage of filling a tank in this way is that it gives a charge of more uniform permeability than any other method known to the writer.

There are four of these tailings vats, each with its bin, conveyor and distributor, and one is charged daily, thus giving four days to complete the treatment of each charge, which consists in saturation lixiviation, washing and discharging. The latter is accomplished by sluicing with two 2½-inch hose, the water being under a 60-foot head, through four side discharge doors and one bottom discharge gate in the center of the vat. By this method 400 tons are discharged in three hours or less at a total cost of less than two cents per ton.

The solution tanks are ten in number and consist of four precipitating tanks of California redwood 22 feet in diameter by 14 feet 9 inches deep, and two storage or supply tanks 38 feet in diameter by 9 feet deep. There are also two water tanks 22 feet by 14 feet 9 inches, for the storage of 80,000 gallons of water. The power equipment consists of a 50 H. P. boiler, one 25 H. P. engine, one 10 H. P. engine for running conveyors, one 30-light dynamo, one Knowles economical geared pump having 4-inch inlet and discharge, two Worthington all iron duplex solution pumps, 5-inch suction and 4-inch discharge, and one two-drill air compressor.

The tailings are the lowest grade in gold of any now worked in this country and are rebellious, containing copper carbonates and sulphide tetrahedrite, arsenical polybasite and ruby silver. The plant operates under very unfavorable climatic conditions, being in the most northern latitude of any known to the writer, but in October and November it exceeded the predictions of profit by nearly 50 per cent and netted about double the return the company considered would justify the erection of the plant.

A "TENDERFOOT," if a good, enterprising man, is welcomed in any of the old camps, says a correspondent of the Denver *Daily Mining Record*. A newcomer is not subjected to the trials and experiments of the pioneers, who were also tenderfeet, but can gain information in a few days which was acquired by them at the cost of years of labor. And sometimes newcomers, by bringing unbiased minds to bear on the question, solve problems over which the old-timers have worried in vain. Instances are cited in which bankers and other business men, entirely unused to mining, have met with success from the start. Mining is not so unlike other kinds of business that a man of good business ability may not avail himself of efficient assistants and run a mine successfully. Many men who are now selling goods at a loss might go into the mountains and mine gold at a profit. If they do not become millionaires, they might at least earn a good living, and in time acquire a competence.

An Interesting Electrical Experiment.

An interesting experiment in high-voltage, long-distance electric power transmission, pregnant with influence on all transmission work, was recently made at Ogden, Utah, in order to ascertain the limits within which high-voltage currents might be used commercially. The experiment was made by Mr. F. O. Blackwell, of the General Electric Company, over the lines which connected the great power station of what was, until recently, the Pioneer Electric Company at Ogden, with the distributing circuits at Salt Lake City, and consisted in connecting the Salt Lake ends of the transmission lines together and dividing the transformers at Ogden, normally used for raising the pressure of the current for transmission, into step-up for the outgoing current and step-down for the incoming. The distance from the power station at Ogden to Salt Lake City is about thirty-six and a half miles. Making a complete circuit of the outgoing and incoming lines, therefore, with Salt Lake City midway, gave a complete transmission circuit of seventy-three miles over three No. 1 wires. The amount of power transmitted amounted to 1000-horse power, and the voltage at which the transmission was effected reached at times as high as 30,000 volts. The current on the return was delivered to resistance vats at the power house, consisting of three wooden tanks.

By careful and repeated measurement with watt meters at both ends, Mr. Blackwell ascertained that this power was transmitted with the loss of only nine per cent, including four per cent loss in the two sets of transformers. The drop in pressure due to inductance was practically nil, the capacity of the line being sufficient to compensate for reactance loss.

Continuing the experiment, part of the Salt Lake City station load was run from Ogden, with current at 24,000 volts. This was supplied to about 500-horse power in synchronous motors and lights for two days, under most severe climatic conditions—rain, fog and snow alternating. In addition a severe thunderstorm prevailed all through the night, the lightning arresters discharging repeatedly. Notwithstanding the severity of the conditions under which the test was made, the motors operated without failure and the lights burned without flickering, even during the times of lightning discharges. Not the slightest difficulty of any kind developed while this experiment lasted.

By the recent accomplishment of a scheme of consolidation all the electrical plants in Salt Lake City, as well as the transmission plants, supplying current from it to the outside, have been merged into the Union Light and Power Co. The companies thus consolidated were the Pioneer Electric Power Co., the Salt Lake and Ogden Gas and Electric Co., the Big Cottonwood Power Co., the Little Cottonwood Power Co., the Citizens' Electric Light Co. and certain smaller interests.

The plant of the Pioneer Electric Power Co. is one of the most important installations in the West, and the transmission one of the longest. The power house is located a short distance from the mouth of the Ogden canyon. The power is derived from the Ogden river, the water being brought to the power house through a wooden stave pipe and riveted steel pipe line, about 32,000 feet long. The electric plant consists of five General Electric three-phase alternators, 24-pole machines running at 300 revolutions, and delivering 750 K. W. each at 2300 volts and 60 cycles. The complete plant is designed for ten units, or a total output of 10,000 H. P. The exciters are G. E. 6-pole 500-volt K. W. dynamos, each of ample capacity to excite ten generators. Each alternator is directly connected to a Knight water-wheel of 1200 H. P. capacity, and each exciter to one of 135 H. P. capacity.

The current is fed into the transmission lines from the step-up transformers at 16,100 volts and delivered to the step-down transformers at 13,800 volts. They are ordinarily connected in delta, but can also be connected in Y to raise the potential to 25,000 volts whenever it is desired to run at the higher potential in order to increase the capacity of the line or the distance over which the power is to be carried. The switchboard panels on the gallery at the end of the power house are for the outgoing feeders and are arranged to handle potentials of 25,000 and 30,000 volts. Everything necessary to control the operation of the electric and hydraulic machinery has been carried to the switchboard panels on the same level as the generators.

Both step-up and step-down transformers are of the air-cooled type and are each of 250 K. W. capacity. The pressure of the current for local distribution to the smaller transformers at Salt Lake City is 23,000 volts.

Pipes for Conveying Compressed Air.

Most of the compressed air plants in mines are inefficiently piped, and no attention whatever is paid to long bends, and the pipes in general appear to be specially installed to exhibit every class and variety of pipe fitting the market affords, and with many duplicates. I have counted five 1-inch elbows in the space of 3 feet, to connect up a pump to the main air pipe, when the price of 1-inch hose and couplings would have been less and the hose would have delivered to the pump nearly the line pressure. The pressure loss in each of the 1-inch elbows would be five-thousandths of the square of the velocity of the air through the pipe. The pump had a 6-inch cylinder and the piston moved 50 feet per minute. The ratio of the cylinder area to the pipe being 1 to 36, the air in the pipe must move 1800 feet per minute, or 30 feet per second. This, squared and multiplied by five one-thousandths makes a loss of 4½ pounds for each elbow, or twenty-two pounds for the five—certainly not a sensible or desirable result; yet one sees it everywhere in the mines. The passion that miners have for 1-inch pipe is marvelous. One may frequently see strings of it, 500 feet long, conveying air. It has cheapness and ease in installment to recommend it, but the wood pile and the owner suffer. A proper plant should have no 1-inch air pipe underground over 10 feet long, and no short elbows.

At some convenient place, where the total length of air conduits from the surface motors shall be a minimum, a good reheater should be established and connected to all these motors. There is ample scope to improve upon the reheaters now upon the market. They may be classed as coil, tube and shell reheaters. The first is a simple coil or nest of coils within a furnace; the tube reheater consists of a nest of pipes screwed into a cast iron head, and all surrounded by a furnace; while the shell reheater is made much like an ordinary domestic sheet iron heater, except that it will sustain pressure, the fire being within it. Any of these will do fairly well, especially if well insulated on the outside to prevent surface radiation.—E. A. Rix, Cassier's Magazine.

Treating Clay Ores.

The following is furnished the Salt Lake, Utah, *Tribune* by Messrs. Weir and Bettles, of Mercur, Utah:

In our method it makes no difference how clayey the ore is, for with the aid of agitation it is first cyanided and no more cyanide is required than in ordinary leaching. From the average ore the values may be obtained from the pan in four hours, and as there are two tons to the pan, twelve tons to the pan can be leached daily. The fine gold having been obtained as a precipitate, amalgamation is then resorted to, and, in the bath of quicksilver which follows, the coarse gold is taken up and the product taken out as an amalgam. There is nothing new about the pan treatment; it is simply in the treatment of the mixture after it has reached the pan, and in the extraction of the metal from the solution.

IN Mexico one cannot take up one or more claims and hold them indefinitely by filing a record of the claims taken, paying a small fee and doing a little mythical work. The claim has to be "denounced" at the mining office of the district, which requires a fee, surveyed by an engineer, who charges likewise a fee, and when his survey is accepted and title granted the claimant has to pay $10 for every "pertenencia" of ground (a pertenencia is an area measuring 100 meters on each side). This payment of $10 per pertenencia has to be made annually thereafter or the claim is forfeited. The placers are mostly hydraulicking or sluicing propositions, in which large bodies of gold-bearing earth have to be moved by the force of heavy volumes of water, to develop, conduct and handle which need the co-operation of associated capital. It takes money to sluice or hydraulic away a bank of earth 20 to 40 feet in depth to get at the gold on the bedrock. Such expenses go far to make it hard for a poor man to embark in placer mining in Mexico; and those who think that with their prospecting pan or rocker, with a few weeks' supply of provisions, they can wash out fortunes are doomed to disappointment. Men with means who can embark in large projects can find opportunities for investment in the Yaqui gold fields and elsewhere; but others will be disappointed.

IN answer to a query concerning the duty on manganese ores, the Treasury Department at Washington says all imported manganese ores and oxides contain a small percentage of metallic iron, and ores containing less than 10 per cent of iron and from 40 to 50 per cent of manganese, or over, are commercially known as manganese ores, valuable only for the manganese contained therein, and have been admitted to entry free of duty as such for the past twenty-nine years, under decisions of the Treasury Department, the original decision being dated July 15, 1879.

Holding Power of Wire and Cut Nails.

Before the Technical Society of the Pacific Coast in San Francisco, Prof. Soule of the University of California recently read a paper on the holding power of nails from data obtained by tests with wire and cut nails, driven in Douglas spruce (Oregon pine) and in redwood.

The points which it was particularly desired to clear up by these tests were:

The relative merits of cut and of wire nails; the merits of different surfaces on the nails; the best shape of nails, as to points, etc.; the relative holding powers of these nails in Douglas spruce and in redwood; the best relation between the length of nail and the thickness of the board nailed by it; the effect of time upon the holding power of nails in the cases of the kinds of timber above named.

The conclusions formed from a consideration of the results of the tests are as given below:

1. Cut nails, for the same area, hold better than wire nails.

2. The holding strength increases with the length of the nail, but not according to any simple law.

3. The pointing of the wire nail adds about 100 per cent to its efficiency. If slightly more pointed than they are made at present, the holding power would be increased.

4. Pointing the cut nail adds 33 per cent to its efficiency, but it increases the tendency to split the wood. To avoid splitting, the taper side only of the cut nail might be wedged. If wedged on all four sides it holds best.

5. Cut nails driven with wedge across the grain are only about 80 per cent as strong as those driven with the wedge parallel to the grain. This fact does not accord with practice in driving, probably on account of the greater tendency to split the wood.

6. A nail is three times as strong when driven into the side of a beam—that is, across the grain—as it is driven into the end of it—that is, parallel to the grain.

7. The holding power of nails increases with time in the case of redwood. It is asserted by some that the tannic acid rusts the nail and thus increases its holding power. It is probable that this effect would be extended over a few months only, after which the further rusting of the nail would weaken it. The effect of time in the case of cement nails does not seem to be great, and is only slightly greater in the case of wire nails, but is very considerable for cut nails.

8. The tests show that all these nails lose holding power with time when driven into Douglas spruce. This probably may be accounted for by the small lateral adhesion of the fibers in that wood and their gradual yielding to the wedge action of the nail. In other words, they pinch the nail less with time, but it seems unlikely that this diminution would continue indefinitely.

9. In redwood a cut nail holds slightly better than a wire nail.

10. In Douglas spruce, the cement nails are 1.3 times stronger than the wire nails.

11. A cement nail is slightly stronger than a wire nail when driven into redwood, but the difference in strength is small.

12. Under shearing stress cut nails are 1.4 times stronger than wire nails. There seems to be no difference in the resistance of the nails to shear in using blocks of Douglas spruce or of redwood.

13. When nailing cleats to a block the same area of nail in the wood will hold about the same stress, whether a few large nails are used or more small ones. The superiority, if any, is in favor of the larger nail.

14. The cut nail holds 1.33 better in Douglas spruce than in redwood; the wire nail about the same in each, with a slight superiority in favor of redwood.

15. The holding power of a nail is not directly proportional to its surface in contact with the wood. In determining the relative holding powers, the stress per unit area has been employed, but as far as possible nails have been taken as nearly alike as practicable, so as to eliminate the error introduced by this method.

16. In drawing a nail, the pull seems to reach a maximum shortly after the nail starts.

17. In the case of a wire nail, the applied stress increases gradually; of a cut nail, by jerks and starts. The decrease of holding in wire nails after reaching the maximum is gradual, while in cut nails it falls off suddenly. Hence, a cut nail is not as efficient in holding together pieces of timber subject to vibration as is the wire nail, for the former is more easily loosened, and, being partly withdrawn, looses much of its strength. This results from the fact that the major portion of the resistance comes from the wedge sides of the nail.

18. Cut nails are more likely to split Douglas spruce, and wire nails to split redwood.

19. In shearing a cleat from a block to which it is nailed, a maximum resistance is obtained for a cleat the thickness of which is two-fifths of the length of the nail used. This agrees closely with the practice of using a nail about 2½ times the thickness of the thinner piece nailed.

20. A slight roughness on the surfaces of a nail is of advantage.

21. The cut nail is more efficient when driven into Douglas spruce, but the wire nail is more so in redwood. This fact bears out the theory as to the manner in which a wire nail holds. The lateral pressure of the redwood fibers is greater than that of the fibers of Douglas spruce, on account of the closeness of the grain of the redwood, it having thirty-six annular rings to the inch, as against fourteen for the spruce; and this holds true notwithstanding that the redwood is softer than the spruce.

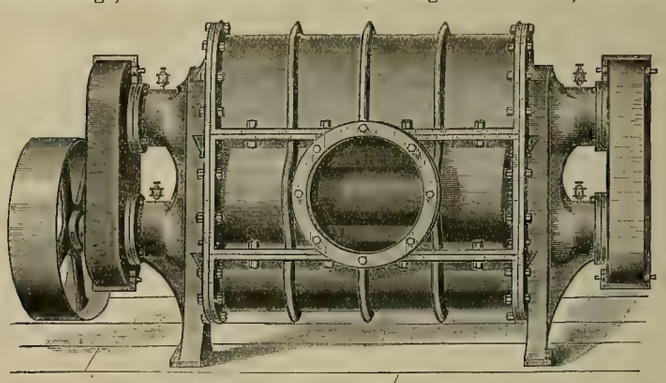
The general conclusion from the tests was that, for most uses and under most conditions, the cut nail is superior to the wire nail.

PROF. IHLSENG of State College, Pa., recently lectured in Boston on "Mine Gases." His explanation of the difference between anthracite and bituminous coal, so far as the gases are concerned, is based on the statement that all coal beds are supposed to have been originally formed on a horizontal or flat bed. The anthracite beds were placed under enormous pressure—or side pressure, to be more exact—by the contraction of the crust of the earth during the cooling stage, thus forming the coal basins as we have them at the foot of the mountains. This enormous pressure resulted in forcing the explosive and other gases out of the anthracite beds to the seams and crevices of the veins and to the fissures, seams and pores of the rock strata. This compression has been so great that gases in the anthracite region are sometimes found with the mighty pressure of 17,000 pounds to the square inch. These facts furnish some idea of the dangers from gases which are met in the mining of anthracite coal, and the professor drew vivid pictures of the power of gas kept under such a heavy pressure. On the other hand, the bituminous beds have not been subjected to such a disturbance and pressure, and the coal, therefore, retains the gases which it contained originally. He showed by experiments and otherwise that all gases burn with a blue flame, and described the effect of the various gases on man. White damp, he showed, is produced by imperfect combustion. Black damp is produced by perfect combustion, and destroys life by reason of being devoid of sustaining elements. Sulphuretted hydrogen, or "stink damp," he said, is a source of danger not commonly acknowledged.

THE prices at which coke is quoted in the different countries are given as $1.44 in the United States, $3.18 in Great Britain, $3.24 in France, $3.36 in Germany, $3.48 in Belgium, and in Spain $5.08. These figures are based on the quantity of coke used in the manufacture of a ton of bessemer pig iron.

Obituary.

MELVILLE ATTWOOD, the well-known mining engineer, died at his residence in Berkeley, Cal., last Saturday. Deceased was in his 87th year. He was born in Worcestershire, England, in 1812. Travel and research gave him a place among scientists half a century ago.



THE LATE MELVILLE ATTWOOD.

In 1843 he secured from the British government patent for a process that gave zinc ore commercial value. In '52 he was looked upon as foremost in metallurgy. In that year he came to California, built one of Grass Valley's pioneer stamp mills and introduced sundry innovations therein. At the time of the Washoe excitement he assayed the Comstock ore, and on his report much of its early fame was founded. His services were constantly in requisition and he was well known all over the coast. He was one of the earliest contributors to the MINING AND SCIENTIFIC PRESS and much of his best thought and experience are contained in its files. His efforts have greatly advanced the mining industry, and in all scientific and technical matters he was long recognized as authority. Personally he was one of the most genial of men, and to the close of a long and useful life he kept up an active interest in all things pertaining to his chosen profession in which he was at all times enthusiastic. He was a member of many scientific bodies, and the presence at the funeral of many members of various technical societies testified to the respect in which his memory was held by many of his old time associates.

Standard Green Blower.

The accompanying cut shows a standard Green blower with discharge outlet on either side. The large size blowers are arranged with detachable journal bearings, the medium and small size blowers have the journal bearings cast as a part of the head plate.

STANDARD GREEN BLOWER.

Its working parts consist of two impellers, each a single casting fastened to a steel shaft extending the full length of the machine, flattened where it passes through the body of the impeller, each bearing bushed with phosphor bronze. The blower is geared at both ends and enclosed in an oil-tight cover.

The makers say: "In designing this blower our endeavor has been to produce a machine which will occupy the least space, displace the largest volume for the space occupied, exhaust and deliver in a practically even volume, have the least weight combined with ample strength, be entirely void of complications, complicated shapes, sliding parts or sliding motion, the least liability to get out of order, the least weight to revolve, be entirely free of internal friction in case of wear of the journals, and do the work with the minimum power."

The above blower is supplied by Fraser & Chalmers, Chicago, Ill.

THE Denver *Mining Industry and Review* notes a new stamp mill, brought out by W. H. Lloyd of Colorado Springs, Colo., in which the stamp differs from the ordinary horizontal drop action, in that it has a backward and forward motion, the stamp, after dropping, sliding over the bed either backwards or forwards, and bringing the rock between it and the bed.

The London Mine Promoter.

NUMBER II.—CONCLUDED.

The anxious time now is the responses—the coming in of the subscriptions by the date named, when the subscriptions will close—it being always stated that the owner of the property reserves all but the few thousand shares, generously offered the public as a great favor, for his property, not caring to sell more. The offering is usually very moderate—a matter of 20,000 shares, say, out of the one hundred or two hundred thousand of the capitalization.

Inasmuch as the promoters and brokers depend upon the amount received for subscriptions to raise the cash to pay the owner, the amount he is to receive, and the expense of registering, printing, postage, etc., every effort is made to get off the utmost possible number of shares. Usually the broker, under an agreement that he is to have the sale and handling of all the issue of shares for the whole operation generally takes the risk of the expense for issuing the circulars, which is no inconsiderable amount, the postage alone often being, with expense of addressing, as much as £100. Then the newspaper advertising, for none must be omitted under the penalty of being jumped on and insinuations that the enterprise is a fraud, etc., all runs up into the thousands. So putting a mine or other enterprise on the London market is no joke, and involves no little risk and loss, in case the subscriptions fall short of covering the promised price to be paid for the property and all expenses. The law requiring a certain proportion of the issue to be subscribed for makes any subscriber responsible, once the total subscriptions justify going to allotment, as is termed, *i. e.*, when money enough has been received to cover the items named. If a failure to do that, the whole scheme is a grand smash-up; the promoters lose the outlay and get unmercifully chaffed and ridiculed, amid much rejoicing by rivals in the business.

As the owner of the property depends usually on the success of the putting out of the enterprise, he has really furnished the promoters with the means of making a large profit. They have made use of him and his property—made him the cat's-paw to rake the chestnuts out of the fire.

It matters very little what his contracts are. They may call for a cash payment in any event; but unless the scheme is a success, he never gets a cent. All the satisfaction he gets is being told to sue if he likes. They know that he, being a non-resident, will be called upon to furnish heavy bonds for possible costs, etc., heavy lawyer's fees, etc., and they can stave off until in disgust he abandons the suit and goes home. The coolness with which the general class of promoter will meet a demand on him for money he *has signed an agreement to pay* is one of the most pronounced cases of barefaced cheek our American friend has probably ever experienced. Such instances are by no means rare where Americans are the plaintiffs. It is needless to say they would not dare repudiate obligations of the kind or those involving their credit among the people they do business with at home in their own community; but it does not seem to impair a London promoter's credit or standing in case the victimized is an American. On the contrary, it is considered rather a smart thing to "do" the Yankee.

Should the launching of an enterprise be successful, *i. e.*, money enough be obtained from the public to cover the requirements, then things go on swimmingly, the owner of the property gets an installment, and, as the issue of such a large capitalization in shares gives them, goes on the Board, the promoters and broker continue to peddle out shares as long as the public will take them and rake in a handsome profit. Meantime, a great show is made of going earnestly to work on the property. If it is a developed and working mine, immediately all practical American miners and local officers are displaced, and relatives of the directors are sent out to fill numerous created offices—a superintendent who has never seen an American mine, at a high salary, a very important part of whose duty it is to boom the mine by encouraging telegraphs and weekly reports, and thereby keep up the price of the shares, and, if possible, to "boost" them to a premium. The mine may be a good one and a paying property, but hampered, as it is, with extravagance at the mine with a half dozen supernumeraries drawing big salaries. With the salaries of the Board in London, office rent and another set of "clarks" and flunkies to pay, it is not strange that dividends are few and far between, and the bright hopes of subscribers are dashed to the ground; the promoters, broker and directors, having gotten rid of their stock, have no longer any interest in supporting it. It naturally goes down, and when the mine can no longer pay its salaries to directors, they gradually drop out and leave their mantles to fall upon irresponsible shoulders. Or, in case public attention is called to the condition of things, a meeting is held and energetic resolutions passed, and a great show of retrenchment made to mollify impertinent shareholders who are troublesome and persist in wanting to know, you know.

The prospectus of a mine put forth on the launching is one of most extravagant promises, and reads like a romance, written to attract the attention of the credulous, widows, butlers and servants, who are the usual dupes, and from whom the bulk of the subscriptions come; the high-sounding names of the directors that have been secured by promises of free shares and fat salaries inspiring confidence.

The English laws are very strict in the matter of responsibility of directors, who have in instances of gross frauds been made to suffer severely, and it is becoming more difficult to secure directors with high-sounding names as a guarantee of the merits of the mine or scheme advocated. When a mine is "launched" and put upon the market as a preliminary step, it must be registered at the "Somerset House," and a full description given of its location, what property goes with the sale, price paid, conditions, etc., names of directors and all parties concerned in the purchase. The expense of this registering is considerable, something near £500. This, together with the printing and mailing of the cartloads of voluminous circulars sent to every city, town and hamlet of the kingdom, as well as the publishing of the prospectus in all the newspapers, runs up the usual cost of launching the scheme to something near £6000—a serious item, which is usually a divided risk between the promoters and brokers who are to have the exclusive manipulation of the shares.

TALC is extracted on a large scale from the granite mountain of St. Barthelemy, in the French Department of Arriege, about twenty miles from the main chain of the Pyrenees. The principal quarry at Tremouin is worked in three banks or terraces, each about 49 feet high. The best rock is of a bright white tint, and feels greasy to the touch when reduced to powder. The quarried rock is brought by a tramway to the end of the quarry in the Axiat valley, and then by wagons eleven miles to Luzenac, where water power is taken from the Arriege river. The mechanical preparation consists of drying in a rotary oven, breaking up small, grinding and sifting, the grinding being effected in mills with steel balls. The larger portion of the product is converted into powder, only a small portion being sent away in a rough state, or cut into pencils for writing on metals. Besides its use in soap and paper making, talc enters into the composition of axle grease, while it also serves as an insulator of the greatest value in the construction of electrical instruments.

THE earth is a result of an explosion that occurred upon the sun, some scientists estimate 30,000,000 of years ago. When this explosion occurred the sun was most likely in a gaseous state and the violence was sufficient to throw the earth far enough away to come within the range of gravital attraction of other planets, consequently what is now the earth did not fall back into the sun from which it had been thrown. Other planets have been caused the same way and from the same source—for instance, the moon and Mars. If a ball should be shot out of a cannon with sufficient force to land it upon Mars, if the inhabitants of that place should use the same word in naming it as we do they would call it "meteorite." If, however, the ball should only have sufficient velocity to carry it say half way to Mars, it would then come to a stop at a point where it would be acted upon by the attraction of all surrounding planets, consequently it would fall upon neither, but would immediately take on a motion or orbit of its own, when it would become a true planet, just as our earth is.—Dictator.

Test for Gold and Silver.

To test a piece of quartz for the presence of both gold and silver, says H. J. McCourt, it will first be necessary to reduce the ore to a powder sufficiently fine to pass through a No. 60 sieve. Place this pulp, when screened, in some flat iron vessel over the fire, so as to burn out those elements that readily sublime or burn. The pulp, when cool, should be placed in some glass vessel and covered with nitric acid, pure or slightly diluted with water. To facilitate the action of the acid, the vessel containing the acid and pulp should be set in a pan partially filled with sand; then heat the pan; the sand will prevent the glass vessel from bursting by rapid expansion. As soon as the acid begins to boil, set it off the fire and let remain standing for several hours. Add about as much again water as there is acid and pulp, then shake or stir thoroughly and filter off the liquid. The liquid thus obtained is a solution of the nitrates of all the metals that the rock contained and that are soluble in nitric acid. Add drop by drop a strong solution of common salt. If a white precipitate appears after adding the salt, it is either oxychloride of bismuth, mercurous chloride (calomel, a salt of quicksilver), or chloride of silver.

To tell to which of these three classes the salt belongs, pour off the fluid above; to the precipitate add muriatic acid; if it dissolves it is bismuth, and neither silver nor quicksilver. If it does not dissolve, pour off the acid, and to the precipitate add strong ammonia. If the precipitate dissolves the salt, it is silver chloride. If it does not dissolve, it is quicksilver chloride or calomel. To the dried silver chloride add an equal amount of washing soda or borax, then it can be melted to a silver "button" of bullion.

As to the gold: take the pulp and filter saved from the first part of the experiment and put into a crucible and heat. The filter will completely burn; next put the pulp through a very fine screen. Now soak for two days in an acid consisting of a mixture of four parts nitric and fifteen parts muriatic acid, which has been prepared at least two weeks before. This will convert any gold present into a perchloride of gold. Platinum will also be converted into a perchloride. Again filter; take the liquid that filters through and evaporate to dryness, either in a porcelain dish or glass flask in the sand, as before described. This is done to remove the acid. Dissolve the dry residue in water, simply by adding warm water to the flask as soon as it is sufficiently cool not to burst when adding the water. When the salt which remained in the flask after evaporating is thoroughly dissolved again, add a solution of ferrous sulphate (copperas) or of oxalic acid and set aside. Let stand for two or three days.

A fine brown powder precipitated to the bottom of the flask is pure powdered gold. Pour off the liquid above the powder; wash thoroughly and dry. These precipitates may be melted into a gold button, but it requires great heat.

The Engineering Chemistry of Boiler Water.

At a meeting of the Engineers' Club of Philadelphia on the 2nd inst., H. Leffman presented a paper on the above subject. He stated that when the applicability of a water to steam making purposes is to be determined the dissolving gases become important, while the organic matter may be neglected, unless it is unusually large in amount or exceptional in character. Surface water is well adapted for boiler purposes, except for its liability to turbidity. Subsoil water, or that obtainable from springs and ordinary wells, is usually clear, and contains notable amounts of solid matter. Deep water is very variable in character, even within a limited area. It is often rich dissolved solids, iron compounds, and sodium chloride. The suitability of water for boiler puposes must be considered with reference to the two properties of corroding and scale forming, which are to some extent antagonistic, since the deposit of material on the iron will, of course, protect it. In general, it may be said that the corrosive qualities are due to the oxygen and carbonic acid present in solution, and more rarely to organic or mineral acids, which are highly objectionable.

The scale forming ingredients in water are principally the compounds of calcium and magnesium in the form of sulphates, carbonates, and chlorides, and the amount and character of the scale will depend largely upon the form of combination. In the ordinary use of water the removal of the carbonic acid is brought about by the heating; deposits in carbonates promptly take place to the amount which is independent of the concentration of the water by the conversion of a portion of it into steam. Calcium sulphate is one of the most objectionable ingredients in boiler water. It is soluble in cold water to the extent of over 100 grains to the gallon, and becomes less soluble as the temperature rises, until at about 300° Fahr., which nearly corresponds to sixty pounds pressure, it is almost insoluble. Although the various materials which deposit in boilers are often collectively designated as "scale forming," yet there is a great difference in the character of the deposit. The carbonates produce soft scale, calcium sulphate a hard scale.

As engineers cannot control the laws of nature, and often have no choice of water, an important question is, What may be done to remedy the objectionable conditions? Turbidity may be easily remedied by filtration, but if filters using alum are applied, care should be taken not to use an excess of it, as decided corrosion might be produced, or hard scale. When corrosion is due to free acid, it may be easily overcome by the use of alkaline substances, among which caustic soda and soda ash would be most generally applicable. The corrosion due to dissolved oxygen will be materially reduced by heating the feed water, and also by arrangements for not allowing the water to come directly in contact with a highly heated spot. The prevention of scale is secured in various ways. The magnesium and calcium carbonates that may be held in solution by carbonic acid are all precipitated by the removal or neutralization of that acid. The former may be accomplished by the heating of the water, and the latter by the addition of some basic substance, such as slaked lime or caustic acid. Calcium sulphate being a most objectionable ingredient, much attention has been given to the methods of preventing it from forming hard scale. At the present day the tendency is to the use of direct precipitating agents, among which may be mentioned trisodium phosphate and sodium fluoride. Both these substances convert all calcium and magnesium compounds into insoluble flocculent precipitates, yielding also highly soluble and non-corrosive sodium salts. They seem to meet the practical issues very well, and are in extensive use.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The Oneida crosscut at the 150 level encountered the ledge at a distance of 255 feet from the shaft. The ledge is about 2½ feet thick and some parts of it are very good, showing free gold and an abundance of sulphurets. Mgr. Truscott is running drifts north and south in the ledge. In the crosscut in greenstone and hard, gray slate about 260 feet was made in one month. Three shifts of four men each did the work with two power drills.——The Wildman Co. have decided to push the new Emerson shaft, to erect an additional forty stamps on the Mahoney property, and put in a new compressor. Supt. J. Ross Jr. has already in hand the erection of the new stamps and other machinery.——Devlin, Marsh & Davis have five stamps of their 10-stamp mill running and are saving their sulphurets. The ledge shows a good percentage of gold and is free milling.——Two water hoists are to be erected on the Satellite copper mine near Campo Seco this summer, in time to commence work with the first water that comes down the Campo Seco canal. When the hoists are up shafts will be sunk 1000 feet.

Butte.

Mercury: D. M. De Long and H. J. Raisch, of San Francisco, are about to inaugurate operations on a large scale on North Fork. Having secured eight miles of the river bed, their purpose is to place a steam derrick to handle the boulders though mining operations are not expected to be under full head way until next season.

Calaveras.

The Utica Co.'s proposition to the people of Angels Camp to explore under the various lots of town at a depth of 500 feet for new veins is meeting with encouragement on the part of the citizens.——Work has started on the Wiggin mine, near Mokelumne Hill.——Sterling Bros. at West Point made a shipment of sulphurets that netted them $167 per ton.——Gouldson & Allen have reached 70 feet on their new shaft and have a vein that yields a fair prospect.

J. P. Cobb has bonded the Golden Bell mine near Murphys for $10,000.

El Dorado.

(Special Correspondence).—By the persistent efforts of a few enterprising men, El Dorado county's merits as a mining section are gradually brought to the attention of outside capital, of which there is a lack in our midst.

The sale of the Gold Note and Philadelphia mines was closed in San Francisco yesterday, E. W. Chapman being the purchaser for $55,000 cash. The property comprises five claims. It was first brought prominently into notice through a report by R. S. Raw in 1892, who has since superintended most of the development of the property. New York capital was interested for a time, but faith weakened at the required output of money. After a long idleness the Septimus Development Co., San Francisco and Sacramento capital, continued the work, again under the superintendency of R. S. Raw, who organized the company. The work as agreed upon with the owners for a certain interest was completed, but negotiations failed of further arrangements and work again ceased. Senator Chapman, who had visited the property, has been negotiating for it for many months, and finally brought order out of chaos in the conflicting interests. The mine has a shaft following the vein 350 feet, which at the bottom is from 5 to 10 feet wide, 5 feet of it being solid ore, mill tests yielding from $10 to $70 per ton. Sulphurets run 10 per cent and assay $380 per ton. There are in addition 160 acres patented land, sawmill, water and steam power, and timber in abundance. The property is twenty-seven miles east of Placerville. Mr. Chapman will resume work immediately and on a large scale.

Placerville, April 26th, '98.

G. W. Kimble has begun work on the Green Mountain mine and has let a contract for sinking a shaft.——The Two Channel gravel mine, near Georgetown, is employing fifteen men. Shortage of water in that section is anticipated.——The *Nugget* says that a 40-stamp mill is talked of for the Griffith Con. mine at Diamond Springs.

Fresno.

W. J. Prettyman is developing an iron property near Porterville. The ore carries some gold.

Kern.

Miner: G. M. Rose, near Randsburg, had ten tons of ore from the May Queen run at the Eureka mill, which turned out about $90 per ton.——Men are working on the Blackhawk, taking out ore. A mill run will be made soon.——C. A. Burcham is working the O. K. mine with ten men and has a ledge 3½ feet thick. The ore is estimated from $40 to $100 per ton.——Leasers are shipping thirty tons ore from the Sister mine to the mill at Cuddyback lake. They are sinking a 200-foot shaft. It will run from $15 to $18 per ton.

Los Angeles.

F. C. Carmicle, near Acton, has taken out about five tons of ore to be tested by the cyanide process at Kane Springs.

Mono.

Three of the cyanide plants at Bodie have started up, and the other three will be in operation again in a few days.——Reading & Maher are putting up a dry washer on the Gold Bank claim.

The report for the week ending April 16 at the Standard Con. M. Co.'s mine and mill near Bodie shows 108 men employed; tons of ore extracted and treated, 282; tons of custom ore extracted, 11; tonnage from stopes, 207; from development work, 75; average daily crushing, 416-7; average concentrates produced, 2%; drifts driven, 67 feet; feet of raises driven, 39; value per ton of concentrates, $111 23.

Nevada.

Telegram: Vincent & Eddy are unwatering the Good Hope mine, near Grass Valley, preparatory to inspection for purchase. The ledge in this property is from 14 to 16 inches wide and the ore will average $50 per ton. The Old Home Con. Co. at Blue Tent have begun sinking and have placed a hoist in the tunnel 700 feet from the mouth.

Placer.

An active and profitable season is expected in river mining of the North Fork of the American river and its branches near Auburn. Near Alta, work on the Gold Standard is being pushed rapidly. The mine is owned by Jones & McKim. The tunnel being run is too high, and as soon as the ground is satisfactorily prospected a new tunnel will be run low enough to tap the bottom of the channel. If this mine opens satisfactorily there will be other mines opened in the same vicinity.——W. Nicholason is working steadily at his quartz ledge near Towle.

Herald: A force of men is at work at the Cash Rock near Forest Hill, putting things in shape for the season's run.——Supt. Roumage has twenty-five men at work at Horseshoe Bar and will soon be ready to start the hydraulic elevator.——A good sized ledge of ribbon rock has been struck at the Maus mine.——The Big Chawk tunnel is being driven ahead rapidly. This mine is being worked under bond by Senator Chapman.——A large force is at work on the Spanish quartz mine and will soon have the mill in running order.——Supt. Chappellet is still driving the Eureka tunnel ahead at the rate of 50 feet a week. He expects to start the upraise by the middle of May.——The Mayflower people are taking out pay gravel and have increased their working force during the past week.——T. Wolford, Supt. Black Canyon mine, will resume work on that property.——Considerable development work is being done on the Ralston Ridge. A contract is about to be let for 250 feet of bedrock tunnel with the privilege of taking 250 feet more.——Work has been resumed on the Buckeye tunnel. Mr. Blackledge is Supt. The contract for sinking 50 feet on the Providential quartz ledge was completed and a contract for sinking 50 feet deeper will be let.

Sentinel: Sinking is in progress at the new shaft of the Bellevue quartz mine near Ophir, which is down 130 feet. Power for pumping and hoisting is secured from an overshot wheel driven by 30 inches of water. With three 8-hour shifts, quartz has been taken out during the past five weeks which returned nearly $6000. The ore was crushed in the Pioneer mill at Ophir. But little drifting and stoping has been done. The width of the ledge varies from 1½ to 2 feet. The Bullion quartz mine, the first extension of the Bellevue, east, has been bonded by this company. The ore in the shaft is excellent, and the company is contemplating the erection of a 5-stamp mill within the next ninety days. Perry & Holland, who have been developing the Evening Star quartz mine, near Auburn, have recently taken out over $3000 worth of specimen gold quartz. The Pioneer G. M. Co. have over fifty men on the payroll at their quartz mine near Towle. Work has been commenced on the new dam, where the company will develop 150 H. P.

Plumas.

Bulletin: J. A. Smith has purchased the mine and water right owned by W. B. Morton, near Quincy. In addition to working the Morton property, Mr. Smith will utilize the water right in operating another mine, near Lone Rock. He will make two miles of ditch and begin hydraulicking. During past seasons the returns secured from it have been satisfactory. Last season, with the limited head of water at command, he realized $15 a day while working.——Near the Morton Cooksey & Walker are opening a small hydraulic claim, which is prospecting well.

Riverside.

At J. Knowley's mine, near Perris, the shaft is down 50 feet and a gold-bearing ledge over 2 feet thick has been struck that averages $15 per ton.——Bates & Langford are putting their tailings at the old Hoag mine through the cyanide plant a second time. They secured 1000 ounces of fine gold, and the prospects are good for getting half as much more.

San Bernardino.

J. Goulding, near Box Springs station, made a strike in his mine of ore assaying from $100 per ton up to $700. Goulding has taken out about fifty sacks of ore, which is high grade.

San Diego.

(Special Correspondence).—The owner of the King mine in the Julian district will begin work immediately on that mine and also upon the Cincinnati Belle, near Banner. The King has long been idle.——The Helvetia mine is to be unwatered by the 20th to admit of examination.——The Kentuck is reported sold to a New York company. A local company will develop and operate the property, in the interest of the New York purchasers.——The Ready Relief and the Antelope mines, near Banner, are actively prosecuting development work and at the same time raising some good ore.

Julian, April 22nd, '98.

Work has been resumed on the Elevada mine at Banner. The 300 tons of ore on the dump will average $30 per ton.——On the Ranchita mine a new vein has been found with 100 feet of ore in sight, while on the old ledge there is still 40 feet in sight.——On the North Star the shaft is all in ore to the 200 level, the depth of the shaft; it will average $40 per ton.——The tailings at the Owens mine are being worked by a cyanide process.——Ore from the San Diego mine, near Julian, to the amount of several hundred tons is being crushed at the Owens mill. The Pierce Bros. are operating an arrastra with good returns.

Shasta.

At the first general annual meeting of the Mountain Copper Co. in London on the 2nd inst. Mr. Keswick, the chairman, said: We are now proceeding entirely satisfactorily with extraction from the mine, and with calcination, smelting and the refining processes with every indication of continuous and smooth working. In the calcination process we are hopeful there may be a still further improvement possible by the introduction of mechanical automatic plant, and to this end experiments are being made which give promise of success. Railway working has been perfectly satisfactory, the line meeting the requirements of traffic with ease and economy. * * * The body of ore from which we are at present drawing supplies is the only one which has thus far been defined with fair accuracy, and in it we have in sight 1,500,000 tons of ore; but in addition to this quantity there is the ore below our present lowest level, the very large mass of ore we know exists at the north end of our property (the quality of which has still to be ascertained), and the other masses we hope and expect to develop under the strong outcrop which for more than four-fifths of its length has not yet been touched. To the prospecting of these masses attention will this year be given as we have opportunities, and as much information regarding quantity and quality obtained as a moderate outlay will procure. The quartz supplies for fluxing our own ores have been chiefly derived from neighboring mines, and their owners received from us every inducement to work them on a larger scale. We have no scarcity of flux, but its richness in gold has not been as satisfactory to us, or to the mine owners, as could have been wished. The precious metals obtained in the past year from the ores treated amounted to 195,000 ounces of silver and 8200 ounces of gold. This gold was slightly in excess, while the silver fell somewhat below the quantity anticipated.

Searchlight: There are ten men working at the Mt. Shasta mine, near Shasta. The old shaft is being drained, and drifting is in progress; paying ore is being shipped to the Keswick smelters. Next year the owners contemplate placing electric plants on the property and sinking 1000 feet. R. K. Howk is Supt.——The Red Hill mine, near Ono, has been in operation for seven years. The poor season has made itself felt to the company. The past winter's work has produced encouraging results. Work for the season will cease next week.——Operations opened a 50-foot bank, with a face of 400 feet, said to average 33 cents per cubic yard. Two days' run yielded $90. M. Gardiner, the owner, contemplates putting in machinery to pump water to a sufficient elevation for effective work.——The California Savings and Loan Society sold to L. Lewisohn, 83 Fulton St., New York City, a number of mining claims, near Redding, for $7700. C. W. Cockerill sold a number of claims to the same party for $20,000. The C. P. Ry. Co. sold to J. Parke Channing of New York mining claims for $1400. The properties were examined by Mr. Channing and F. R. Mills, Supt. Merced G. M. Co., Coulterville, Cal. It is understood that a large smelting company will operate the property.

Sierra.

The Happy Hollow mine, near Portwine, has started work.——Near Slate Creek House, Wilson Bros. and Willow have begun prospecting the old Mexican ledge.——The Los Angeles Co. that bonded the Kenton mine, near Alleghany, are driving a tunnel and building a road to haul in machinery. This mine has not been worked for over twelve years. T. R. Garnier is Supt.

Siskiyou.

Journal: The company bonding the Yreka creek property has completed the deal, and will soon place machinery on the ground for prospecting. Holes of 6 inches will be bored to bedrock at a distance of each 200 feet along the ground from Hawkinsville up to the Yreka end of the McNulty place. If satisfied with the prospects, a dredging outfit will be secured of 100 H. P.——The river miners on the Klamath are all at work putting in wing dams, and some are hoisting. The Quinne & McConnell claim force commenced hoisting last week and the Pacific mine at Humbug will commence hoisting within a week. The Benz bar claim at Honolulu will soon have a new wing dam completed, also the Phil Mott claim, while the Vesey creek claim is hoisting pay gravel.——The Gold Ball mine at Salmon river is running steadily.——The river miners at Oak bar and Hamburg bar will have a good season. The river will be lower than ever before known.——The miners at Callahans and south fork of Scott river will do a good deal of mining the coming summer and will have a good supply of water.——The new steam pump is in position at the bottom of shaft No. 3 at the Greenhorn blue gravel mine and will soon be in operation.

News: The King Solomon mine is employing thirty men in the diggings beside the crews working in the woods.——S. J. Fore is operating his hydraulic mine at Callahans.——The Benz Bar claim, at Honolulu, has a new wing dam completed.——R. L. Fagundes, of Sawyers Bar, has struck a good lead in the Hibernia mine.——Ore from the Live Yankee mine, near Sawyers Bar, is being crushed at the Fagundes mill.——The new wing dam at the Phil Mott claim on the Klamath river is nearing completion.——E. F. Mathewson is working eighteen men at Swiss Bar and intends to employ six more.——Reeder & Brown at their mine in Fool's Paradise, at the end of the 30-foot drift struck a 12-inch ledge, some of the ore going several dollars per pound. So far several tubs have been taken out of rich ore. One piece of ore is 12x12x4 inches in size and through the center is a layer of gold 12x12x1 inch. This is the same property from which $6000 was taken in three months, about four years ago, the crushing being done in a hand mortar. At that time the vein was only 1 inch in width.

Tuolumne.

(Special Correspondence).—The activity presented in this county in the development of mining properties and the operation of existing mines is indicative of great promise in the output of gold from this section of the mother lode. It is carefully estimated that there are in and about Sonora between 5000 to 6000 men engaged in prospecting and active mining.

Eastward from Sonora between the Stanislaus and Tuolumne rivers are some of the notable mines of the county, prominent among these being the Alameda, Rawhide, Trio, Dutch, App, Santa Isabel, Golden Rule, Jumper, Eagle-Shawmut, Republican and Harriman.

Among the new developments which is rapidly taking rank is the Bell mine, near Tuttletown, owned by a few San Francisco capitalists. The property has no stock to sell nor is it being developed for market and hence I am pleased to state that unusual as it may seem for a California company, there was every opportunity afforded the writer to gather valuable information concerning this mine. The owners have faith in California's paramount industry in the mining field, and they show an inclination to further and encourage a legitimate enterprise. Were it otherwise my statements would seem a desire to "boom" a property. I have the authority of a prominent and successful mining man operating in this section who has inspected the mine that the Bell will be among the greatest mines of California. Work was begun upon this property under the superintendency of Geo. Blake, who is also part owner, about eight months ago. Work has been crowded day and night. The shaft has reached 400 feet. Crosscuts were made at the 200 and 300 levels. At 400 drifting has been started. From the 300 down the shaft is in the pay chute all the way. The vein is 62 feet wide. The lowest assay made yielded $2.25; the highest was $157. It is carefully estimated that the entire vein will plate $8. The sulphurets run about 2½ per cent and yield $127 per ton, growing heavier with depth.

The owners calculate putting in a mill about June of 100 stamps; the power will be electricity, which it is expected can be installed about Aug. 1st.

Sonora, April 25th, '98.

Democrat: The vein opened by a crosscut tunnel in the Hope mine is 38 inches. The ore is high grade. The crosscut tunnel is 202 feet. Drifting will be started on the vein both ways, and at the same time the tunnel will be driven to a shaft 50 feet for the purpose of securing air. At 70 feet from the mouth of the tunnel the west vein was cut, 2 feet wide and highly sulphureted. After the ore body in sight in the big ledge has been opened, attention will be given to this point as well, and it is known that the quartz there is worth $40 per ton from wall to wall. The Hope has been a combination milling and pocket proposition, and has yielded from $100,000 to twice that amount in pockets alone.——The vein on the Mignonette averages 1 foot in width, with a pay streak 10 inches wide that has been traced 800 feet. It is free milling, the percentage of sulphurets being so small that concentrates will not be considered. The mine was worked years ago and paid. A drift was run 200 feet, but, as the pay chute was lost, it was abandoned. This chute has been picked up again. Various assays show the quartz to be worth $20 per ton clear across.——Operations have been commenced on the Klondyke of the East belt, situated near Confidence. A shaft is being driven on the vein. It is the intention to sink 400 feet. The vein varies in width from 1 to 5 feet, and assays show it to be worth $19.50 per ton.——The work of adding twenty more stamps to the Shawmut-Eagle mill has commenced.——The Grizzly Co. are putting up their new 20-stamp mill, power for which will be obtained from the New Albany ditch.——The Lady Washington mine has been temporarily shut down. The mill has been hung up pending the resumption of underground operations.——The mill on the Sell mine began dropping its stamps last week.——A shaft on the Triumph mine shows from 18 inches to 2 feet of quartz.——The Pearl mine has eight men at work. It is in the Big Basin district of the East belt. The vein is 14 feet thick, and is being opened up by means of a tunnel.

The Santa Ysabel is running on ore from $8 to $15 per ton. The company is said to be earning from $2000 to $3000 per month.

Yuba.

J. W. Relley of Grass Valley has brought foreclosure suit for $20,000 against P. Campbell and the new Blue Point M. Co., whose properties are located at Smartsville.

NEVADA.

The Higbee-Russell Co., operating at Dunn's Glen in Humboldt county, will erect a concentrator at Galena to handle an ore body of some magnitude found in the Buena Vista group. Three carloads of the ore, after a long haul, netted $12 a ton. There are 200 tons of ore on the dump. The shipping ore averages about 100 ounces silver per ton. A small force are blocking out free-milling gold ore at Dunn's Glen that averages $10 per ton for the Higbee-Russell Co., who contemplate putting a mill on this property. In addition to this, the company has eleven men working on the Star group on ore that yields gold, silver and lead, and will be marketed in the shape of concentrates. The Glasgow & Western Ex. Co. has acquired fifteen claims near Battle mountain for $250,000. This property was operated in the seventies by the Battle Mountain Co., which shipped ores to Swansea that yielded 45 per cent copper, together with values in gold and silver. The long haul to market made the handling of the product unsatisfactory. The output will be treated at the reduction works at Golconda, which will be able

to handle the concentrates from 100 tons of crude ore daily.

The second payment of $1000 has been made on the Jupiter bond by C. D. Lane. T. T. Lane bonded the property near Ely for $25,000 from Scott & Peters. The terms of the sale were $1000 in ten days, $1000 in thirty days, $3000 in six months, $8000 in twelve months and the balance in eighteen months. There had been but little work done on the property. Mr. Lane immediately put men at work to prospect the ground.——The electric plant at the Dexter mill in Tuscarora is in operation and thirty stamps are crushing.——The sheriff has sold all the interest of C. V. Peck in the Douglass mill at Dayton for the amount of costs, as there was not enough to make Douglass even on a $44,000 judgment. The mill may soon be started up on the Douglass tailings.——Twenty tons a day are being put through the crushers at the April Fool at DeLamar. At the cyanide plant eight leaching tanks are operated, and the percentage of gold saved is said to be satisfactory. The April Fool began the distribution of dividends last December.——At the Magnolia a small force is at work and taking out good ore——At the DeLamar the mill is running on the usual amount of ore.

The Pioche *Record* says that prospecting at the old Comet district continues, and that Smith & Peaslee have found a 4-foot vein that assays from $3 to $11 per ton in gold.——The Freudenthal Bros., working in the old Comet mine, have discovered ore 2 feet wide carrying gold values from $3 to $98 per ton. This claim was worked years ago for silver only.——The Dexter mine at Tuscarora shipped $3300 in gold. An increased supply of water has enabled the management to increase the tonnage. At the stamp mill forty-five tons are going through daily, and at the cyanide mill thirty tons. Two shipments of cyanides were made this month.——Sinking was resumed in the Young America east shaft and three eight-hour shifts are employed. The company has been pumping steadily for three weeks.——At the Ben Hur mine, near Ely, the tunnel has reached 100 feet and a good body of quartz has been found.——The ore bodies in the Star and Grey Eagle mines on the fifth and sixth levels average 10 feet in width.

OREGON.

Democrat: A trial run of a week was made with a prospecting boat on Midas bar in Snake river near Ontario. The run was so satisfactory that it was concluded to put in a dredger of 2000 cubic yards capacity daily. E. S. McComas of Baker City is the owner of the property. The bar is nine miles long by 2400 feet in general width, and carries an average depth of gravel of 27 feet above the present stage of water. From the examinations made it is reported that the gravel yields from 40 to 50 cents per cubic yard. Mr. McComas has also leased ground for ten years to parties who are to construct three dredgers of 2000 yards capacity each.——At Bernard's ferry Mr. Bernard has three drag scrapers at work that yield $20 per day for each scraper.——Shreves & Oliver are at work adjoining McComas' ground and taking out $36 a day with two drag scrapers, the water being furnished by an 8 H. P. gasoline engine. They sold two claims to Lyon & Co. of Colorado for $5000 cash.——I. B. Hammond is building a 2000-yard capacity dredger at Nysse. —— O'Brien & Co. are building a dredger at Morton's island and the New Zealand Co. has a large dredger ready for operation at Emerson's.——There are eleven boats being changed over to chain dredgers between Payette and Great Bend, a distance of about thirty miles.——Williams Bros. are mining above Morton's island, handling their dirt with wheelbarrows and taking out $7 a day per man.——Col. Eckerson will soon begin the construction of a dredger near the mouth of Sucker creek, near Midas bar.——A strike of tellurium ore was recently made in the Oregon Bonanza mine, near Grants Pass.

In the Collateral mine, at Baker City, the average assay across a 16-inch vein was $90. There are fifty tons of ore on the dump.

WASHINGTON.

A strike of 30 inches of high-grade ore has been made in the Gray Horse claim, near Nelson. It is said to assay $40 in gold.——The Copper Mountain mine, near Republic, has stopped all surface work and is running a tunnel to get depth and strike the ore chute that was encountered in tunnel No. 2. In this tunnel they have been cutting stringers of mineral showing fair assays. The tunnel is in about 50 feet.——Development has begun on the Mountain Grouse. The ledge is about 10 feet wide on the surface.——At Republic development is being pushed on the Cantonwine group, on which the ledge can be traced for 800 feet. The outcrop is 60 feet wide and surface assays run from $2 to $3 in gold.——At the Methow mine, in Okanogan county, nickel ore has been discovered. Assay returns show 1.67 per cent nickel, valued at $13.36, and $8.64 gold and copper.——The Copper Gold mine at Bossburg has two shifts at work.——Work on the Niagara mine at Meyers Falls will be resumed and sinking continued.——The Velvet at Northport has forty men employed.——The Black Boy has a large quantity of ore on the dump.

Everett *News*: Judge Reid has signed an order appointing W. C. Butler receiver of the Monte Cristo and Pride of the Mountain M. Cos. on application of J. B. Crooker. The amount of the indebtedness of the former, as stated in the complaint, is $99,000, and the latter $125,000. Owing to the absence of transportation facilities since the Everett & Monte Cristo road was washed out, these mines have been non-productive, and the receivership deal may be merely a convenient method of handling the properties until mining operations are resumed.——The Copper King mine near Chewelah is operated under bond and lease by the Montana O. P. Co. of Butte. A tunnel was started 300 feet below the main shaft in 4 feet of ore that averages $12 each in gold and silver and 25 per cent copper.

BRITISH COLUMBIA.

(Special Correspondence).—E. Blewett has asked the Vancouver Council to take stock in his smelter company. If they do, he will bring in machinery capable of treating 100 tons daily. A smelter is needed in Vancouver, as many companies on the coast are sending sample shipments of 50 to 100 tons constantly to Wales for treatment.

Vancouver, B. C., April 25th, '98.

The mines of Kootenay have paid dividends amounting to $4,032,000. The Payne mine paid $1,800,000; Whitewater, $123,000; Hall Mines, $160,000; Fern, $10,000; Slocan Star, $400,000; Reco, $287,500; Idaho, $220,000; Rambler-Cariboo, $40,000; Goodenough, $32,500; Le Roi, $725,000; Last Chance, $37,000; War Eagle, $187,000.

Shipments continue from the Le Roi at Rossland at the rate of 200 tons per day. The ore is in three grades, the first running from three to four ounces gold, the second one and one-half ounces, the third $15.——At the War Eagle 125 men are at work. When the new compressor plant is installed, which will be about October 1st, the force will be increased to 250. The ore body on the 500 level is said to be 50 feet wide, and of this 12 feet averages $25 per ton. The mine has been opened to a depth of 625 feet. The company has made a contract with the Trail smelter to supply it with 100 tons of ore per day until the mine's new hoist is installed, when the output will be increased to 200 tons daily. The contract price is $7.50 per ton, flat, without regard to iron excess.

The tunnel on the Sovereign, near Rossland, is in 125 feet, and a 2-foot body of iron pyrites, with a little copper, found. Assays run from $5 to $15, and an average is close to $13.——The long-standing litigation involving the Mollie Gibson group, in the Slocan, has been brought to a close abruptly by the judge having nonsuited the case. When it was located, in 1896, considerable excitement was created, the surface showing and assays being of good values. It is galena, running high in silver. W. George located the claims. There are three: the Mollie Gibson, Florence and Aspen. B. White, Mgr. Slocan Star, liked the showing and got a bond on it for $79,000. Two strong veins are said to run through the three claims of the Mollie Gibson group. There is a law in British Columbia that a person may not locate two adjoining claims on one vein. George evaded this regulation by locating the Mollie Gibson with discovery post on one ledge, then locating the Florence with the width of a claim intervening, setting the discovery post on the parallel ledge. Then, on what he claimed to be a cross ledge, he located the Aspen, between the other two, and at right angles to them. The jumpers saw what was apparently three claims on one vein and placed five sets of stakes. Mr. White consummated a deal by which the bond for the property passed into the hands of R. H. Pope of Quebec. The first payment was to be made when the title was perfected. Men were put to work and shipments made, reported to have gone as high as 196 ounces of silver and 50 per cent lead. The adverse claimants began suit to enforce their alleged rights. The title of the case was Callanan vs. George, and it has been dragging through the courts. To further strengthen the case for the original locator, the claims, when surveyed, showed that all were too large, and when contracted they did not adjoin each other, and thus the letter of the law in the matter was not violated. The case of the original locator was so plainly right that the judge nonsuited the case.

The War Eagle at Rossland, it is said, contemplates equipping the mine with an air compressor that will have two 24x48-inch cylinders and provide air sufficient for forty-five drills. Instead of belting, it will be run with cotton ropes, and a 500 H. P. dynamo will provide the power. The hoisting plant will also be operated by electricity, and will be capable of hoisting from a depth of 3000 feet, the load being eight tons and the average speed 1000 feet per minute.——Ore shipments from Kaslo up to April 20th aggregated 346 tons.——During the first three months of '98 the shipments from twenty leading mines of the Slocan amounted to 850 tons.——The London & B. C. Goldfields, Ltd., of Nelson are arranging for a 40-stamp mill at Ymir.——The new owners of the Athabasca, Nelson district, will shortly let a contract for a stamp mill, compressor and steam hoist.

ALASKA.

The Last Chance G. M. Co. will install machinery on their property near Juneau to wash 300,000 tons of dirt a month under a pressure of 300 feet. The debris will be deposited on the tide lands at the Indian village, and what is now waste land will be formed into a ship harbor and water front for Juneau.——The Lurney mine will be worked by hydraulic next July. The company has invested $117,000 in property and $15,000 for machinery. There are sixty men employed and the force will be increased to 200.——At the Julian mine near Berners Bay recent work has disclosed a large ore body. The crosscut from the bottom of the shaft has cut the ledge at a depth of 400 feet. The ore is of good quality. The mill has been started.——At Silver Bow Basin the Ebner mill has started work. The ore in this property maintains a good value. The mill will be increased ten more stamps.

THE KLONDIKE.

J. Daniels and B. B. S. Phillips of Seattle and J. Deland of Kansas City left Dawson March 30th and say they will be the last to come out over the trail this season. The sun was blistering hot when the party left Dawson. The party had two dog trains, and made the trip almost light, making the fast time of twenty-one days to tide water. Many streams were open and the trail was bare of snow. Daniels and Phillips say that the output at the lowest will be $20,000,000. They confirm the story of the rich find on Monte Cristo—an island sixteen miles below Dawson. At bedrock, 43 feet, the dirt was paying $8.60 to the pan. Since then all islands near Dawson have been staked. Just before the party left gold was discovered in Dawson and the townsite was being staked. Dawson has plenty of provisions. Phillips says the Yukon will be open for navigation about the first week in May. The Chilcoot aerial tramway is in operation and charges 5½ cents a pound to the summit, 7¼ cents to Lake Linderman and 12½ cents to Lake Bennett.

IDAHO.

Between Dixie and Elk City R. W. Brownell discovered a 7-foot vein of free milling quartz of good grade. Two feet nearest the hanging wall shows free gold. It is reported that a gold button valued at $10 was taken from twelve pounds of the ore with hand mortar and pan.——A body of high grade ore has been discovered in the Badger mine, on the 150 level. Hoisting machinery will be put on the property at once.——Penneman & Yetter have crosscut the veins of the Homestake at a depth of 320 feet with a 400-foot tunnel. They have encountered 5 feet of free milling ore.——The greatest depth attained in the Florence district is at What Cheer. The lowest tunnel taps the vein at 226 feet depth. The Banner shaft is 176 feet, the Poorman 166, the Blossom and Waverly each 160, the Goldbug and Redbird considerably over 100; yet in no instance has a vein in the above list proved a disappointment, either in size or value of the ore body. On the contrary, every vein has improved with depth. The Banner hoist is being put in place for sinking a new shaft 300 feet; the Poorman will resume sinking as soon as the shaft is installed. Work on the new Elkhorn shaft is under way, and the Hiyu, Waverly, Blossom and Mikado will have deep shafts before next fall.

The 200-foot tunnel on the Golden Gate mine, near Moscow, will be completed May 15th, when the property will be turned over to the Pleiades M. Co. The prospects are said to be encouraging and the company contemplates erecting a mill.——In the Hiyu mine, near Florence, a new strike is reported on the 90-foot level, showing a vein 160 feet long and from 4 to 20 feet wide. The assay return from $1.70 to $297.78 per ton. A heavier hoisting plant and a skip capable of carrying a ton of ore are to be installed this season, together with a concentrating table. It is said the company contemplates enlarging the 5-stamp mill. H. B. King is Gen. Mgr.——It is stated that the new mill on the Morning Glory mine at Mullan will be the largest in the Cœur d'Alenes, having a capacity of 1500 tons of ore daily.——Near Preston a force is at work on the War Eagle, from which a carload shipments will be made. The ledge is 5 feet, free milling, and yields good values. H. A. Meyer of Preston is the owner of the property and he will at once make arrangements for erecting a mill.——The Lucky Boy mine in Boise basin has crosscut the vein, which is 25 feet wide on the 250-foot level, with 10 feet of $10 free milling ore, not taking into consideration an 8-inch seam of $50 free milling ore.

UTAH.

The Mercur M. Co., in the distribution of its dividend last week—which was the thirty-ninth in its history—made the total paid to date in profits $1,030,000. This property began its paying history in September, 1893. The first dividend was distributed among seventeen stockholders, residents of Utah and Nebraska. To-day there are 351 shareholders, scattered from Connecticut to California and from Canada to Mexico. The *Tribune* says that to the Mercur's success the cyanide process is more largely indebted for its present popularity than it is to the achievements of any other property on the western hemisphere.——A carload of ore, amounting to 200 tons, from the Swansea netted the company $3400. Silver and lead predominated, but a fractional amount of gold was also present. The property is situated at Silver City.——The Ophir Hill property will resume work within a few days. The ore from this property, of which 9000 tons were produced during the last year it was worked, is in active demand at the smelters.——Work on the Fairview group at Tintic has started again under a lease for eighteen months for $75,000.

By a recent option G. S. Peyton acquires the right to purchase, within six months, the controlling interest in the Northern Light M. Co. at 60 cents a share. On the same basis the holdings of the company would sell for $240,000. He will prospect new ground while running the mill upon ores that have been blocked out.——The Mercur M. Co. reported with 1000 pounds of auro-cyanides of the value of about $25,000. The consignment represents a run of fifteen days at the Mercur mill. The strike of a new ore body is reported in this property at the 400 level.——At the Hercules mine, near Lion Hill, the vein has widened to 12 feet of a good grade of ore.——The tunnel of the Dalton at Marysvale has reached 750 feet. The Mgr. expects to drive 500 additional feet to reach the vein.——In the Mammoth, on the 800 level, an ore body has been carrying silver, lead and gold.——A pay streak of ore has been found on the 300 level of the Homestake at Tintic.

Nelson & Sterling secured a bond for $30,000 and the renewal of a lease which gives them four years' time on mining property near provo.——At the Old Jordan & Galena at Bingham, from 450 tons of crude ore put through the concentrators every sixteen hours 150 tons of concentrates are derived.——S. Newhouse paid $142,237.72 cash for the Stewart and fifty-seven other claims at Bingham. Work has begun at different places on the group and will be extensively pushed.——The West Mountain G. and S. M. Co. is resuming work on the St. Patrick group, extending the main tunnel which shows 3 feet of cyaniding ore that assays $8 per ton.——The tunnel on the Greek group cut through a 2-foot ore streak that assays thirty ounces silver, 17 per cent lead and $2.50 gold.——Two carloads of good grade have been shipped from the Tiewaukee this month.——The Phœnix will market about 125 tons of good grade ore this month.——The Old Telegraph has twenty-five carloads of ore to its credit since April 1st.——Thus far this month the Spanish has marketed thirty carloads.——Operations have resumed at the Winnamuck in the 400.——The vein on the west dip near Mercur has been developed for a distance of two miles and a half, and deep shafts are being sunk to catch it on the dip.——The Emerald mine, near Logan, is making a good showing. A body of steel galena and lead carbonates has been uncovered. Samples of the galena assayed 80 per cent lead, and the carbonates show nine ounces silver and $3 gold.

The Park City *Record* reports it certain that the Silver King will build a mill. The removal of cottages on the mill site has begun, and Mgr. Kearns says that as soon as the ground is cleared surveyors will establish lines for the mill and grading begun. The mill is to be of a combination character, with sufficient capacity to work the mine's output of second-class ore. Power enough will be put in to handle the product of the mine's free milling ore, as well as the gold ledge.——The Hassen mine will hereafter be called the Gold King.——The ore shipments from Park City were: Silver King, 960,680 pounds; Anchor, concentrates, 241,220; Ontario, 59,880.——Shipments from Silver City were: South Swansea, three; Swansea, five, and Iron mine, nine carloads.——The mill at the Sacramento is to be enlarged and increased to over 200 tons daily capacity.——McCauley Bros. have in their mine near Alpine a vein of ore from 4 to 25 feet wide, carrying from $4 to $25 in gold and four ounces of silver.——At Ashbrook the Salt Lake M. & I. Co. are producing twenty-five tons of ore daily.——In the Golden Star the ore body is 4 feet wide. Last season's shipment showed an average valuation of $148 per ton.——Wadley Bros., at Pleasant Grove, resumed work on the Lady Ann tunnel.——The Waterfall mine has two carloads of ore on the dump.——At Willow Springs, on the C. E. Allen group, the ore shows 25 per cent lead, 96 ounces silver and $18 gold per ton.——The Century, near Kelton, is making regular bullion shipments.——On the White Swan 2 feet of $33 ore has been uncovered.

MONTANA.

At Camp Creek E. L. Mahoney has three carloads of ore for shipment that assays 25 per cent copper.——The Speculator mine has reached 850 feet depth and will be continued to 900 feet.——The Moulton mine, at Barker, will ship 8000 tons of ore to the smelter at Great Falls.——A fifty-ton concentrator will be erected on the Daisy mine at Cooke in June. Enough ore is blocked out to keep it in operation four years. Sixty men will be employed.——The Boston & Montana Co. filed a suit in the U. S. Court against the Chile M. Co., which is now understood to have a lease on the Rarus mine. The plaintiffs set out the same facts in their complaint as alleged in their former suit against the Heinzes and the Montana Ore Purchasing Co., and claim $75,000 damages for the alleged value of ore taken from beneath the surface of the Pennsylvania through the Rarus mine. The same questions are involved as in the former suit, especially the old one of a divided apex. The arguments will be heard at Helena, April 29th.——E. Braden, assayer in charge of the U. S. assay office at Helena, estimates that from 1881 to the end of 1898 the Butte mines produced the following values:

Gold	$ 11,148,075 74
Silver	148,883,234 29
Copper	225,055,467 02
Total	$385,086,777 05

The Ruby mine will sink another 100 feet, making the shaft 400 feet.——The Comet Co., near Basin, contemplates the building of four miles of railroad to the mine for the shipment of accumulated tailings of an estimated value of $2,000,000.

Development work has been pushed by the Butte & Boston Co. on the Michael Davitt claim, which the company recently purchased for over $600,000. A raise is being made from the 350 workings to the surface for a three-compartment shaft, through which the Davitt and adjoining ground will be worked.——A Spokane company will develop the Climax claims near Sylvanite.——At Camp Creek, Bowman & Co., on whose property a tunnel of between 600 and 700 feet has been run, are extending the tunnel.——Some good gold has been shipped from Placer No. 3, owned by A. W. Bernard. This mine has been a producer for years, and, though the ore bodies are not large, the values run high in gold and silver—as high as $200 to the ton.

WYOMING.

Mgr. Green has begun the construction of a pipe line thirteen miles long preparatory to opening hydraulic operations on an extensive scale near Atlantic City.

It is estimated that there will be expended in the development of placer and quartz mining in Lewiston district this summer between $300,000 and $400,000. A Chicago company headed by G. R. Davis, who have purchased 300 acres of gravel lands, and a New York company that bought an extensive acreage at Devils Gate, begin work May 1. Salt Lake people will build a cyanide mill at Lewiston to work the low-grade ores of that section.

The Spring Creek placer claims near Cheyenne were sold to Sturgis & Weir for $18,000; a cash payment of $5000 was made. Development work begins at once.

SOUTH DAKOTA.

Last month's ore shipment from the Wasp No. 2 mine, near Deadwood, amounted to 400 tons of a gross value of from $40 to $60 per ton gold.——J. J. McLurin has bonded the El Dorado, near Hill City. Permanent improve-

ments are being made. Milling ore has been taken out valued at $28 a ton gold.——J. Barr is investing money in the Bismark and Big Hit mines, near Keystone. J. Mattes is the Gen. Mgr. There is a tunnel 270 feet long at the bottom of a 180-foot shaft in the Bismark which crosscuts a body of ore 43 feet wide. The Big Hit has a 200-foot shaft and 400 feet of drifts and crosscuts. The ore averages $8 free milling.——Eastern people have bonded a portion of the Lucky Boy property for $90[illegible]—$2000 down.— The Edna M. Co. at Garden City has opened a vein of ore that assays as high as $48 per ton in gold.

MICHIGAN.

The annual report of the Hecla M. Co. for the year 1897 shows reciepts from bullion, $170,582; miscellaneous $2877; total $173,459; total expenses were $212,898, showing a loss of $39,439; deducting this from the balance of $71,219 brought forward from 1896 left a total of $31,780. From this dividends amounting to $30,000 were paid, leaving a balance of $1780 at the close of year. The company has paid a total of $2,175,000 in dividends on the capital of $1,500,000. The products were 406 ounces in gold, 215,431 ounces silver, 184,836 pounds of copper and 1,990,175 pounds of lead. The total amount of ore taken out was 4403 tons first class and 768 tons second class. The mining cost was $20 56 per ton of first class ore, or $17.53 per ton including all ore.

The Marquette *Mining Journal* states that Boston people have purchased the property of the old Winona M. Co. for $250,000. The property comprises 1480 acres twenty-eight miles south of Houghton. There are two shafts down, one 30 and the other 40 feet. Test pits have proved the property for a distance of 1650 feet.——Dredging has begun for the new docks of the Quincy M. Co. at Pewabic Sands, where the Quincy will erect a new smelter. Work will be pushed rapidly, owing to refusal of Detroit and Lake Superior smelters to treat Quincy mineral after May 1.

A prospect shaft has been started on the Winona copper property, near Houghton. Surveys will be made for a mill and water supply.

COLORADO.

The Dollie B., at Leadville, resumed shipments to the smelter the 20th inst. Everything is in condition to take care of all the water the workings will make.——Several new leases were let on the Nisi Prius Con. M. Co. April 22nd. The Hall shaft lease is reported to have cleared above $10,000 in March. ——Forty wagon loads of ore, each carrying seven tons, is the daily output from the Ibex gold mines. This tonnage is divided between the home smelters, the oxide silica ores being taken by the Arkansas Valley and the copper-iron sulphides to the Bimetallic. About 525 men are on the pay roll. This output is kept up twenty-six days in the month, besides the development work which is kept years in advance of the stoping. About two-thirds of the underground men are kept on prospect work. The daily output of oxide iron is 1000 tons. About thirty railroad cars are billed out of the city daily on the high line alone. The Rio Grande is also taking out several trains daily of carbonate-iron and sulphide ore. Several additional iron shippers have been added to the list.

The Republic and Mary McKinney, at Cripple Creek, are the big producers of the northwest slope of Raven hill. The ore chutes in both properties are long and wide, and as depth is gained the values increase. The ground is being worked by different sets of lessees and ore is being shipped from four shafts. The company has in the neighborhood of $40,000 in the treasury from royalties.—— The daily output from the Killum and Ogilvie lease of the Hull City placer is one carload that runs between three and four ounces.—— The Lillie during the present month will increase its output over last month's by many tons, the tonnage in March being 1250. The shaft is now 440 feet deep.——A steady producer is probable from the development on the Zeolite, recently taken under lease by Cobb, Wilson & Co., who drove a crosscut from a shaft about 50 feet in depth and found a body of ore which returns shipping values of $30 per ton. They have about 25 feet of mineral which averages $30 without sorting.——At the Legal Tender sinking has been resumed and 100 feet will be added to the shaft, when the total depth will be 625 feet. The latest work in this mine shows ore bodies regular and uniform in value, which will make the output for April reach quite close to 2500 tons. ——A new strike was made this week in the 300 level of the Christmas. A 3-foot vein of ore running $60 has been cut.——Riggs & Co., on the Colorado City, are taking out two-o[illegible]ore from a 10-inch streak at 75 feet depth. The Fluorine has been shipping from fifteen to twenty tons a day for the past four months.——The Comet-Emma at the second level has a streak of ore 3 inches wide that runs from $150 to $200 per ton. ——An assay in the Holmes lease of the Pharmacist yielded at the rate of $240 per ton.—A strike of importance was made last week on the Christmas. At a depth of 300 feet a vein 3 feet wide was cut which gives assay values of from $[illegible] to $[illegible] per ton.——The Specimen has put down a shaft 200 feet and is following the vein with drifts. The vein shows 3 feet of quartz and talc, which assays as high as $586 to the ton. The Lucky Gus lessees have another consignament of 100 tons of ore at the sampler.

At La Plata the Little Jane mine shipped thirty tons of twenty-ounce gold ore. They have 4000 pounds of ore that samples $7 a pound. The ore chute has an 18-inch streak of tellurium ore. The company intends to sink 400 feet. The Keystone has 3 feet of two-ounce gold ore. They are taking out two cars a week. The Columbus has cut a 3-foot streak of tellurium quartz. A reduction plant is contemplated on this property.——The damage done by the fire at the Seneca shaft, Leadville, is to be repaired at once, and McNiven & Co., the lessees, will continue operations as in the past. The fire will cut down the shipments from the Seneca combination for a short time. The Seneca Co. is not doing any company work, but has a number of leases going. From the Seneca shaft proper McNiven & Co. have been shipping from thirty to fifty tons a month of carbonate ore from a depth of 275 feet. The same lessees are operating the Lent shaft of the same combination, from which they are shipping from 500 to 600 tons of iron ore a month. La Bonte & Co. are operating on the Bullion shaft and shipping 300 to 400 tons of iron ore a month. Fuller & Co. are operating the Keene shaft, from which they are shipping sixty to seventy-five tons of carbonate ore a month. Parker & Co. are operating the Ponsardin shaft at a depth of 430 feet in the sulphides. Dix & Co., working the Gambetta shaft, made a shipment which netted a good return. They have a contact 40 feet in thickness.——The idea has been abandoned that Denver people are to swing the Smith-Moffat interests in the down-town area and local mining men are at the head of a movement to organize the Home M. Co., with a capital of $50,000—that is, 50,000 shares at $1 each. The first assessment on the stock is to be 30 per cent and then 10 per cent each month until enough money is raised to put the mines in condition to work. Bodies of mineral now under water are known to be opened in different workings of the properties, and if the new enterprise can be carried successfully, it will mean much to the camp in general, and more especially to the merchants of the town. When again in operation, this down-town area alone would employ at least 800 men. Should the Home M. Co. be able to resume pumping, it will take from sixty to ninety days to get out the water and resume mining.——The Big Four Co. is again in operation. At present they are not shipping heavily, but carrying on development work. Shipments amount to about 200 tons of sulphide and oxide ores. It is the intention to carry the shaft down to open the ore chutes of the lower contact. The operations at present are carried on in the different workings between the 200 and 600 levels.

The Leadville *Reporter* says that everything looks favorable for the consummation of the project to form a local company for the unwatering of the down-town mines.——The Independent mine at Crestone, at a depth of 280 feet, opened into a vein 34 feet wide that mills $35 per ton. The 10-stamp mill is cleaning up from $3000 to $4000 weekly.——H. C. Thompson has given a bond on his property for $40,000.

The Silver Mountain and Pittsburg, near Empire, continues to show large bodies of ore and the operators are getting ready to sink the shaft 200 feet deeper.——At the Newfoundland mine, near Central City, the water is out of the shaft, which is 540 feet deep. Mgr. Mabee reports ground above this to work on before commencing other operations. ——The Star of the West property is operated by the New York & Indiana G. M. Co., which in sinking the shaft at a depth of 235 feet has opened up a pay streak of smelting ore, showing gray copper mixed with iron. Another contract will be let at once to sink 75 feet.—— The Topeka mine is making heavier shipments than for some time past, and is also shipping some good grade smelting ore which does not include the high-grade ore.——Cook & Co., in the Toledo adit, have opened into a streak of smelting ore 18 inches in width—copper, carrying gold, that will assay 15 ounces gold to the ton. They have opened up a block of stoping ground, and in addition to the smelting have had plenty of milling ore.——In the lower level of the Seaton mine, Mgr. Goldsmith reports streaks of lead and copper ore which will run $50 per ton.——The receipts of gold at the Denver mint for the week ending April 16th were $364,425 17. During the corresponding week of 1897 the receipts were $240,730.54. The value of the gold deposited during the present year is $5,384,832.49, a gain over the same period in 1897 of $3,159,713 84. ——The Gaston at Central City, from a wagon load or ore sent to the sampler, netted $522.30. ——The Foot & Thompson Dhu has been leased to S. B. Shaw. The property has a 6-foot vein at a depth of 400 feet.——At the Isabella, at Cripple Creek, the tonnage for the month of all grades will be between 800 and 900 tons that will have a gross value of about $35,000. In the new shaft drifts have been started at the 630-foot level.——Jennings & Kerr have received returns from ten tons from their lease on the Lillian Leland, which averaged $46 and was taken out in the course of sinking the shaft. At a depth of 80 feet the lessees have 12 inches of ore, and assays are obtained running from $50 to over $500. ——The work of sinking for an additional level on the El Paso Gold King is under way; ore is being broken at the 500 level. The output averages about twenty-five tons per day. ——The Anchoria-Leland will output this month an average of fifteen tons per day. It will run close to $40 per ton. The mine is earning the regular dividend of $6000 per month. Connections were made with the Anchoria-Leland shaft and the Cripple Creek and Gold Hill tunnel. The tunnel cuts the shaft at a depth of 652 feet. The vein has not been entered below the 350-foot point.——The daily output of two leases on the Deadwood runs about ten tons a day and averages from $40 to $90 per ton.——The Fox lease on the Hull City placer sent out a three-carload graded shipment. It will run from two to eight ounces.——An output of close to 200 tons a month is made from the Gold Dollar. The ore averages $40 and comes from a 4-foot body. ——The Denver *Record* says that work in the lower tunnel of the Independent mine at Spanish Creek opened 18 feet of ore averaging over $60 per ton. A large amount of ore has been blocked out and a 10-stamp mill is talked of by the owners.——During March the Lillie Co. at Victor shipped 1200 tons of a gross value of $71,000, and a net value of $58,000. The operating expenses amounted to $12,000, leaving a net profit of $46,000.——The *Evening Telegraph* says that the Gold Coin at Victor made a strike in the fourth level of about 4 inches of ore running $7000 to the ton. The managers are sacking the matter and will ship it under guard.——Returns from the first shipment from the Hagerman lease on the Orpha May went at the rate of $52 per ton.——Since February, 1893, the stockholders of the Victor have received $900,000 in dividends. At present the mine has more ore in sight than ever before. The same company has another good property in the Golden Cycle group at Goldfield. In the Legal Tender there is a large body of ore blocked out in the 500-foot level. ——The Strong is loading from four to six broad-gauge cars per day. About half the tonnage is sent to the smelters, the balance being treated at Colorado City. The ore averages from $50 to $60 per ton.——The Moon-Anchor shipments of the past week were 125 tons of smelting ore and forty tons of mill ore. ——Specimen shipments for the past week amounted to forty-nine and a half tons of ore. The ore on lease E ran $27 and the ore on lease Q $40.——It is reliably reported that the Buffalo and Cripple Creek struck ore in the Newell tunnel, which is over 1000 feet long. A few days ago a large vein was crosscut some 500 feet from the surface and a short drift started. Assays run as high as $50. Six veins have been cut by this bore, but no drifting has been done. Assays have been obtained on two other leads in the property at the point intersected that run from $10 to $20 without sorting.

A large area of placer ground in Summit county, including some of the best known and richest placer mines in that county, will be worked by the Pence-Miller Placer G. M. Co.; capital stock, $3,000,000.——The crosscut from the seventh level of the Terrible mine, near Georgetown, cut the ledge a few days ago. It was driven 350 feet through the granite at a cost of about $3000.——The *Investor* says a contract has been made between the Elkton Con. M. Co. and the Colorado-Philadelphia R. Co., for the treatment and reduction of all the ore of the former running less than $100 per ton for the next fiscal year.——The Tillman property, near Eldora, owned by the Emma A. G. M. Co., has been leased and bonded to Brown & Convers for $25,000, for eighteen months, with 15 per cent royalty to be paid on all the ore shipped.——An 18-inch vein of copper has been opened in the Antietam. The returns show over $50 a ton.——For the first quarter of '98 Rico shipped 225 cars of ores and concentrates compared with 109 in the first quarter of '97. The gain equals 116 carloads, or 106 per cent.——W. A. Johnson & Co. at Leadville have started work on the Mike and Star property and are draining the mine. The shaft is 500 feet in depth and bodies of sulphide ore are already blocked out. These properties contain large deposits of iron sulphides which several years ago could not be worked on account of treatment charges, the ore being of a refractory nature, but modern improvements of smelting have overcome these obstacles.——The Big Four M. Co. is working fifty men and is pushing developments, very little ore being shipped. The ore chute in this property is small and narrow, but rich.—— Vivian & Co. are pushing work in the Garibaldi tunnel, which is now more than 1300 feet long.

At the Gold Sovereign, Cripple Creek, the output has been steadily increasing, and this month has been such that for the past ten days the company received more royalties from the lessees than it did through the entire month of March. The drift at 80 feet is showing a chute 72 feet in length, averaging 3 feet wide, and shipping at an unusual average. The ore in the shaft has been of low grade until of late, and about the 100-foot level a richer chute was entered, and this has been gaining until at 140 feet. Three feet of ore shows an average value of $70 per ton. On Monday night four carloads were shipped—three of them from the Lovett and one from the other three workings.——At the Free Coinage group the territory is worked in small blocks by lessees and ore is shipped from three shafts.——The Pinto Co. have sunk 350 feet, and at this point are mining high-grade ore. The output is about fifty tons per week, and the ore averages better than $150 to the ton. The property contains the south extension of the Maloney vein, opened on the Orphan Belle fifteen months ago. Three shifts are employed sinking for an additional level. It is down 75 feet below the 350-foot point. Drifts will be extended when it has reached a depth of 450 feet.——Fisher & Perkins have their shaft on the Free Coinage group 75 feet below the 350-foot level, and expect to start crosscutting when 25 feet more work has been accomplished. They are making an output of fifty tons of high smelting grade ore a week, and have opened a chute for 185 feet on the vein that will average close to 3 feet in width. ——The Portland has increased its dividends from $30,000 to $45,000 per month.

NEW MEXICO.

W. Doty has cut into a vein of gold and copper-bearing quartz that promises well. He will sink in the vein. The prospect is near Red River.——Hatton Bros. have resumed work.——The Two Sisters will drive the tunnel another 100 feet. Their tunnel is already in 160 feet and is in low-grade sulphide ore. The tunnel has been in this ore for the last 60 feet, and crosscutting 25 feet has failed to find any wall.——C. Compton & Co. sold to E. C. Abbott a four-eighths interest in the Ironclad placer claims, embracing 118 acres of ground near Red River.——In the Red Bandana group, near Elizabethtown, a 2-foot ledge was uncovered that assays $200 per ton. The claim in which this rich ore was found has not been worked in recent years, as the adjoining claims furnished the mill with sufficient ore. The new strike is of uniform character.——The Montezuma M. Co. of Elizabethtown has put in a plant to sink their shaft 150 feet.——The Argue placer dredge at Elizabethtown is in constant operation. The prospects are that the placers will take out more gold this year than ever before.——At the Ortiz mine, at Dolores, the water supply is being increased, after which the machinery will be increased to treat 100 tons per day. The shaft is down 300 feet and sinking continues. The vein varies from 7 to 10 feet and is partly free-milling ore and partly a concentrating proposition.——The shaft at the Cochiti has reached 180 feet and the ore runs $18 per ton, averaging $12. Supt. Merrill estimates an average profit of $5 per ton on the basis of 90 per cent of the mineral being saved in its treatment.

The Standard mine at Gold Hill has resumed operations after an idleness of two years.——Thirty men are working in the Simpson smelter at Copper Flat. About sixty

STEAMERS TO KOTZEBUE SOUND.—PACIFIC COAST and KOTZEBUE SOUND TRANSPORTATION & TRADING COMPANY'S (JOHNSON-LOCKE MERCANTILE COMPANY, Agents,) New Steamer, the GRACE DOLLAR, capacity 300 passengers and 800 tons of freight, will leave San Francisco June 1st for St. Michaels and Kotzebue Sound.

Passengers intending sailing for Kotzebue Sound are reminded that the GRACE DOLLAR is a newly built, triple-expansion steamer, lighted with electricity, with every modern convenience. Her bows will be sheathed to enable her to make early progress through the breaking-up ice in Kotzebue Sound, thus landing her passengers ahead of sailing vessels or other competitors.

Passage on the GRACE DOLLAR insures an early and a safe arrival in Kotzebue Sound.

The GRACE DOLLAR insures at lowest rates of insurance, while many of the antiquated sailing vessels now being advertised are forty to forty-five years old and cannot insure at any rate.

The KOTZEBUE SOUND TRANSPORTATION & TRADING COMPANY will erect at a convenient point on the Sound a store, trading post and warehouse, where supplies will be kept for the convenience of miners.

THE INITIAL TRIP OF THE GRACE DOLLAR WILL BE MADE FROM SAN FRANCISCO TO KOTZEBUE SOUND.

Thereafter she will ply between St. Michaels and Kotzebue Sound, making three or four trips a month, and will connect with the steamer "Morgan City" for San Francisco.

For freight and safe passage apply to the JOHNSON-LOCKE MERCANTILE COMPANY, 609 Market St. (Passenger Office), or 204 Front St.

men are employed in the mine.——The Pacific mill, near Silver City, is running steadily, turning out concentrates.——At Alhambra the old shaft has been unwatered and the entire mine will be overhauled and retimbered.——The shaft on the Julia is down 65 feet and being timbered. The owners will push development work.——At Golden the Black Hawk mine carries silver, lead and gold aggregating $40 per ton.——In the Collins group the main ore body is copper, with a 4-inch streak of gold ore.

ARIZONA.

The Guijas G. M. Co., near Oro Blanco, is pushing developments with satisfactory results. The property is opened to a depth of 100 feet and an ore body of nearly solid pyrites exposed. Two hundred tons of high grade ore are on the dump.——At the Golden Star property a crosscut has been driven 150 feet and the ledge justified all expectations. A tunnel has been driven along the vein 250 feet and the ore demonstrated to be of good character. A sample of five tons of unassorted ore gave an average value of $35 per ton in gold. The velvet group is also in process of development and showing up well in free gold.——The Turning Point mine, near Casa Grande, is in active operation. Gold and silver ore has been opened up and a mill is shortly to be put in. The property is owned by St. Louis people.——The Blue Jay mine in Pima county has struck several good ore bodies. Seven tons are on the dump that are expected to bring about $1000.——Rye, Gila county, gives information of the discovery of two coal beds near the surveyed line of the old Arizona Mineral Belt railroad. The two seams are about 60 feet apart, one being 20 inches thick and the other about 4 feet. The coal burns well and looks to be of first-class quality.——At the Grand Reef mines, near Range, the power drills are in over 300 feet. The property will be thoroughly developed before reduction works are built. J. W. Mackay of New York is furnishing the capital for development.——At the London and Gallen copper mines in the Whetstones work is progressing satisfactorily. A shipment of 500 sacks of ore was made, which will be followed by other shipments from time to time. Seven men are pushing work on the main tunnel, which is in 120 feet. It is expected 90 feet more will reach the ledge. A depth of 300 feet will have been attained on the ledge when that ore body is reached.——Another strike has been made in the Azurite mine near Tucson. A few days since there was a strike made in the main drift of a large body of medium grade ore, the average of which is about 10 per cent copper, some gold and silver. The latest strike is in the east drift on the 200-foot level. The ore body is a fraction over 5 feet. Over 3 feet is black sulphurets, which gave returns of 34 per cent copper, 18¼ ounces silver, $3 gold. On hanging wall is 1¾ feet of green carbonate, which gives 10 per cent copper, 9 ounces silver and a fraction over $3 gold.

The Bradshaw G. M. Co. will soon resume work on its properties at Minnehaha.——Several inches of ore has been struck in the Empire mine at Chloride that is said to average 1.121 ounces in silver.——Fifteen claims are being developed in the Huachucas of Cochise county.——At the Blue Jay mine, near Tucson, there are seven tons of ore on the dump that runs over $100 per ton.——The Guijas G. M. Co. has reached 100 feet depth and has taken out 200 tons of gold ore of good grade.——The Storm Cloud mine in Yavapai county, being developed by Eastern capital, has reached 150 feet depth and is making weekly shipments of bullion.——The C. O. D. mine in Mohave county has 10,000 tons of ore on the dump and is turning out fifty tons of concentrates daily.——The vein in the Red Rock mine, near Prescott, is from 18 to 24 inches wide, and the ore is valued at $60 per ton gold.

The United Globe mines are running their large furnace and making a fair output of copper. A furnace of 150 tons capacity has been ordered. The company's mines are said to have shown considerable improvement of late.——La Fortuna gold mine, in Yuma county, has been opened to a depth of 600 feet and work is pushed faster than the ore is taken out, and the ore reserves are growing. The mill crushes seventy-five tons of $25 rock per day, saving over 80 per cent and affording an output of $45,000 monthly. C. D. Lane owns the controlling interest.——The Black Warrior Copper Co. has purchased five copper claims. The Black Warrior Co. now own eighteen claims in Webster gulch, on some of which they have expended in the aggregate $70,000. A large amount of ore has been extracted. Development work and the hauling of ore to the smelter have been resumed.——The Pinto Creek M. & S. Co., near Globe, have resumed development work on their Pinto creek group, which consists of ten claims. Supt. Calder is pushing work on the Yo Tambien with three eight-hour shifts. An incline shaft, all in ore, is down 70 feet. A crosscut was run, tapping the vein in 40 feet, where a drift is at present in 130 feet. The vein in the drift is from 4 to 10 feet in width. The ore is largely quartz, carrying gold values, besides copper, which is in the form of carbonates, oxide and sulphide. The vein also carries lead and silver. Some work has been done on the Winona. Three parallel ledges have been discovered on this claim. The ore is quartz, carrying gold and crystallized lead. The north ledge has been crosscut and is 7 feet wide. At the present rate of development machinery will soon be required for deeper sinking.

MEXICO.

It is stated that the sale has been made of the Colorada-Creston Co.'s properties at Minas Prietas and La Colorada. The purchaser is the same company that bought the Amarillas and Grand Central.

The interests of the Moctezuma and Cleveland M. Co. and El Tajo M. Co. at Lampazos have been consolidated, and work has begun on an extensive scale. J. Frush has charge.

Coast Industrial Notes.

—Flour is rising in price at the rate of 25 cents per barrel per week.

—Wheat went to $1.80 per cental in San Francisco during the week.

—A. S. Hallidie and associates of San Francisco propose working the coal deposits at Winter Harbor, Quatsino sound, B. C., recently illustrated and described herein. They are shipping a complete plant for mining the Quatsino coal.

—The Denver & Rio Grande Railway Co. proposes to compete with the Canadian Pacific for Oriental business, and contemplates the establishment of agencies in Hongkong and Yokomama. This traffic would be diverted from the Victoria line of steamships to those that run to San Francisco.

—The Santa Cruz powder works now employ 228 men. The Government contract for powder amounts to $3,000,000. This week 76,000 pounds of brown powder were shipped East. Powder is now sent in charges ready for use. Contracts for cartridges for the large guns are being filled. In each cartridge there are 275 pounds of smokeless powder. The works were partially destroyed by an explosion on the 26th inst. This will necessarily delay the filling of all contracts.

—A singular commentary on the cost of transportation as an element in the cost to the consumer is afforded in the ultimate "value" in this state of Cumberland coal, used largely by blacksmiths. The Maryland Coal Co. gets 85 cents a ton for it at the mine. It is railroaded to Point Locust, Md., shipped thence round the Horn to San Francisco; sent from here to California interior points; then sacked and carried on mules and burros to several almost inaccessible points where mining is carried on, finally costing the consumer 5 cents per pound, or $100 for what originally cost 85 cents.

—The California Development Co. is credited with intent of another effort to irrigate the Colorado desert. It is estimated that the entire system can be constructed for $300,000, and that a canal can be built large enough to carry sufficient water to irrigate 1,000,000 acres of land. No pumping works will be necessary, the canal having throughout its entire length a natural fall of 330 feet from the point where the Colorado river is tapped to its extreme northern limit in Riverside county. The lands to be reclaimed are situated in San Diego and Riverside counties, and in the northern corner of Lower California. The center of the tract is about 100 miles from the city of San Diego. The acreage of first-class lands reclaimable by the proposed system of canals is given at, approximately, 1,600,000—900,000 being in the United States.

—Consular Clerk Murphy from Colon reports the completion of the La Boca dock, the Pacific terminus of the Panama canal. The real importance of the work at La Boca, says Mr. Murphy, remains to be demonstrated. The tide fluctuation at Panama amounts to over 25 feet, and at the lowest ebb the bottom of the sea is exposed for a mile or more from the shore. As to whether or not vessels will venture to use the La Boca dock, time alone will prove. He continues: "I have heard the opinion expressed that the dock will prove to be a complete success. On the other hand, I have heard it even more confidently stated that this is only another example of the waste which has characterized the management of this apparently simple undertaking. To one traveling across the isthmus, it appears that there can be no obstacle to the completion of the canal which money honestly used, engineering skill and common sense can not easily overcome. The land is most level, the highest point being little over 300 feet above the sea. The distance is only about forty-five miles. The freshets of the Chagres river appear to be the only difficulty, and it appears that provision for the storage or escape of such water can be made. The work, if it were in American hands and under American control, could, I believe, be completed in a few years at a moderate cost. About one-half of the work—fourteen miles at this end and six at the other—has been completed or partially completed, though the freshets of the Chagres river have caused great damage during years of neglect."

Commercial Paragraphs.

THE Colorado Iron Works Co. of Denver, Colo., have an order from John A. Moore for one water-jacket smelting furnace, to be erected in the San Juan district.

ADAM SCHILLING & SONS shipped to the Inyo Mining & Development Co., Keeler, Cal., on the 12th inst., one of their new improved mining hoists, direct connected with a 25 H. P. Golden Gate gas engine.

AN article on the tanks used in the Pelatan-Clerici process, recently published, referred to the tanks used. The Risdon Iron & Locomotive Works, San Francisco, are the manufacturers of those tanks on the Pacific coast. The Risdon Iron & Locomotive Works have recently built three mills using this process.

THE Colorado Iron Works Co. of Denver, Colo., recently shipped two carloads of machinery to old Mexico—one car being water jackets for the Great Central Mexican Smelting Co. of Aguascalientes, Mexico, and the other car constituted amalgamating machinery for the La San Gonzalo M. & M. Co., Gabriel, Mexico. They also made shipment of one carload of water jackets for the Arkansas Valley Smelting Co., Leadville, Colo., and one 44 cu. ft. capacity slag truck for the Copper Queen Con. Mg. Co., Bisbee, Arizona.

Personal.

W. B. FISHER continues Supt. Gold Blossom mine, Ophir, Cal.

J. LEGG is the new Supt. Northern Light mine, Park City, Utah.

G. F. SHERMAN is appointed Supt. Empire mine, Grass Valley, Cal.

A. BUCKBEE has resigned as Supt. Eureka Hill M. Co. at Eureka, Utah.

C. ROOKLIDGE becomes Supt. Queen of Sheba mine, Spring Creek, Utah.

D. E. BIGELOW of the Union Iron Works, San Francisco, is in southern Oregon.

J. LAWLER, owner Hillside mine, Yavapai county, Ariz., is in San Francisco.

GEO. W. BARNHART of San Francisco has returned from a business trip to Marion, O.

H. E. PICKET, managing owner Grand Victory mine, Placerville, Cal., is in San Francisco.

CAPT. THOS. MEIN is at Hot Springs, Arkansas, and goes to Douglas Island, Alaska, in June.

J. MCKELVEY, a mining capitalist of Oakland, is examining properties in El Dorado county, Cal.

L. F. WRIGHT, Gen. Mgr. Mountain Copper Co., Keswick, Cal., has returned home from San Francisco.

L. L. MEYERS, Supt. N. B. hydraulic mine, North Bloomfield, Cal., has returned home from San Francisco.

R. H. POSTLETHWAITE is superintending the erection of two Risdon gold dredgers at Breckenridge, Colo.

COLORADO'S STATE GEOLOGIST, T. A. RICKARD, has returned to Denver after a protracted absence in Australia.

GEO. H. EVANS, Gen. Mgr. California Gold Mines Co., left this week for London to reorganize the Banner M. Co., Butte county, Cal.

A. E. HOGUE, Gen. Mgr. The Universal Corporation, Ltd., of Saskatchewan, B. C., is in San Francisco getting pointers on gold dredging machinery.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SINGLE-TRACK RAILWAYS AND CARS.—James Hopkirk, Oakland, Cal. No. 602,601. Dated April 19, 1898. This invention relates to railways of that class in which a single line of track is supported at a height above the ground, so that cars may be suspended to travel upon these rails. It consists essentially of a frame-work upon which the track is supported above the surface of the ground, cars mounted in pairs upon opposite sides of the track and frame-work, trucks having wheels journaled at opposite ends adapted to travel upon the rails, transverse timbers centrally swiveled on the trucks extending through the opposite ends and upper part of each car, with hangers supported from these timbers extending downwardly into the cars, so that the weight of the latter is adjustably supported from the hangers. Horizontally journaled rollers are adapted to travel against rails fixed to the posts of the rail supporting frame-work at points in line with these rollers, to prevent too great a swaying of the cars when in rapid motion.

DEVICE FOR FOLDING TOILET PAPER.—Wm. E. Coombs, San Jose, Cal. No. 602,595. Dated April 19, 1898. This invention relates to a device which is adapted to cut continuous sheets of paper into desired lengths, folding the sheets to form packages with alternate sheets overlapping each other from alternate sides. It is especially designed to form packages of toilet paper which are afterwards placed in holders, from which the sheets are removable singly and independently. This paper is brought to the machine in continuous sheets from opposite sides and delivered to a common center, where they are laid alternately, one over the other, cutting the lengths double that of the packages to be formed and folded down, so that each sheet is alternately folded over the opposing one. This is effected by means of an oscillating or vibrating roller suspended from above the central portion of the apparatus, the paper being held by clamps, and by means of vertical movable casings and cutters therein the paper is severed to the proper lengths and afterwards folded by the reciprocating roller.

OIL VAPOR TRACTION ENGINE.—Daniel Best, San Leandro, Cal. No. 602,594. Dated April 19, 1898. This invention relates to an improvement in what are known as "traction engines." The object is to provide a self-propelled engine capable of drawing loads upon the roads, and which is especially adapted to be used in countries where water cannot be obtained in necessary quantities for the use of steam engines. The invention consists essentially of a frame with supporting and driving wheels having two sets of cylinders mounted in pairs thereon, each cylinder having the top and bottom of its open end formed with longitudinal slots or channels, cross-heads projecting from the pistons, slidable in the slots, and detachable connecting rods uniting the cross-heads, so that the cylinders of each pair may be used together or the rearmost piston disengaged, and only one pair be employed for light loads. Connections are made between the pistons and a crank shaft and intermediate gearing between the crank shaft and the driving wheels serve to transmit power thereto. A vertically disposed carburetor is connected with the adjacent ends of the cylinders, so that oil or other hydrocarbon vapor may be employed explosively in the engine cylinders, thus avoiding the use of a steam boiler, with its added weight and the water necessary for its operation. In order to keep the cylinders sufficiently cool, it is necessary to circulate water about them, and this water is conveyed through a cistern of pipes so as to be exposed to the atmosphere and its temperature reduced after each passage over and around the cylinders, thus maintaining the same body of water without any essential advantages. The gear is so arranged that different rates of speed may be produced and the apparatus very readily reversed to run in the opposite direction.

CAR COUPLING.—R. H. McCaughey, Cambbell, Cal. No. 602,605. Dated April 19, 1898. This invention relates to improvements in apparatus for coupling cars, and it consists essentially of draw bars, fulcrumed and movable to or from each other in a horizontal plane, the bars having diagonally disposed meeting faces, so that the heads are separated to pass each other when they come in contact. The rear of these heads has hook-shaped projections which interlock when the bars are again brought into line after the heads have passed each other, and by means of weighted bell crank levers the draw bars are normally retained in the position of engagement. Suitable devices are connected with the draw bars to pull them apart, to allow the heads to disengage and pass each other when it is desired to uncouple the cars. The weights serve to return the parts to their normal position whenever they are released.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 19, 1898.

602,796.—WAVE MOTOR—H. R. Alden, Portland, Ogn.
602,503.—MATCH IGNITER—Axelson & Gunn, Los Angeles, Cal.
602,594.—TRACTION ENGINE—D. Best, San Leandro, Cal.
602,798.—BALLOT BOX—H. Braasch, Los Angeles, Cal.
602,694.—ROPE CLAMP—A. R. Bradeen, Seattle, Wash.
602,496.—TRUNK HARNESS—H. Brunner, Jr., S. F.
602,505.—FOLDING TOILET PAPER—W. E. Coombs, San Jose, Cal.
602,698.—RAISIN SEEDER—C. S. Cox, Fresno, Cal.
602,735.—PUZZLE—F. H. Donaldson, Garvanza, Cal.
602,657.—STEAM TRAP—C. R. Franklin, S. F.
602,601.—SINGLE-TRACK RAILWAY AND CAR—J. Hopkirk, Oakland, Cal.
602,561.—KEY—B. J. Loomis, Los Angeles, Cal.
602,605.—CAR COUPLING—R. H. McCaughey, Campbell, Cal.
602,794.—ENGINE—J. Porritt, S. F.
602,795.—PRESERVING EGGS—F. C. Smith, Los Angeles, Cal.
602,492.—PUMP—C. G. White, Woodland, Cal.
602,811.—BOTTLE—G. H. Williams, Los Angeles, Cal.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $6,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

W. J. SHOTWELL, - - - - General Agent, 314 California St., San Francisco, Cal.

S. K. HOOPER, General Passenger Agent, - - DENVER, COLO.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, April 28, 1898.

Actual commencement of hostilities has cleared the air of vapory imaginings, and last week's flurry in local holdings is over. As here, so in the East, staples are higher, industrials have receded, and though in some lines trade is dull, the markets throughout keep up. New York City reports money on call steady, 1½@2½ per cent; prime mercantile paper, 6@7 per cent. Sterling exchange steady, with actual business in bankers' bills at $4.84¾@4.85 for demand at $4.81¼ for sixty days. Silver certificates, 57¼. Mexican dollars, 45¼c. Bar silver, 57c.

PIG IRON.—Firmer, with $6.70 bid and $7 asked.

LAKE COPPER.—Unchanged; $12.10 bid, $12.25 asked.

TIN.—$14.50 bid.

SPELTER.—Easier; $4.10 bid, and $4.20 asked.

LEAD.—Firmer, with $3.70 bid and $3.75 asked. The firm fixing the settling price for leading Western miners and smelters quotes lead at $3.50.

SILVER.—London quotes silver at 26¼d; San Francisco, 56¼c.

COAL.—San Francisco cargo lots: Wellington, $8 per ton; New Wellington, $8; Southfield Wellington, $7.50; Seattle, $6; Bryant, $6; Coos Bay, $5.50; Wallsend, $7.50; Scotch, $10; Cumberland, $10.25 in bulk and $11.50 in sacks; Pennsylvania Anthracite Egg, $14; Cannel, $10; Rock Springs, Castle Gate and Pleasant Valley, $9; Coke, $12 per ton in bulk and $14 in sacks.

In answer to inquiry the following is given as the latest United States official valuation of certain foreign coins and currencies:

Bolivia, silver boliviano	.30.42.4
Central America, silver peso	.41.4
China, Canton tael	.68.3
" Tientsin tael	.66.4
Colombia, silver peso	.42.4
Ecuador, silver peso	.42.4
India, silver rupee	.20.1
Mexico, silver dollar	.46
Persia, silver kran	.07.8
Peru, silver sol	.42.4

Mining Share Market.

SAN FRANCISCO, April 28, 1898.

The Comstocks and other mining shares had a dull week of it. Alta and Hale & Norcross kept up pretty well. Good reports were received from Con. California & Virginia, Sierra Nevada and Occidental Con., though the latter drooped. On Wednesday there was a slight advance all through, Sierra Nevada selling up to 74. On the Brunswick lode the main north drift, 600 level, was advanced 10 feet; total length, 484 feet. This drift is following the foot wall, on which is a streak of quartz from 5 to 8 inches wide, assaying from $2 to $3.50 per ton. Incline shaft No. 1 has been sunk a distance of 3 feet; total depth, 1194 feet; bottom in porphyry.

NOTICE OF ANNUAL MEETING.

JAMISON MINING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California; works, on Jamison Creek, near Johnsville, Plumas County, California.

In accordance with the by-laws of said company, the annual meeting of the stockholders of the Jamison Mining Company will be held at the office of the company, rooms 50 and 54, 120 Sutter Street, San Francisco, California, at 2 P. M., on MONDAY, the 2nd day of May, 1898.

SAM. W. CHEYNEY, Secretary.

Dated March 11th, 1898.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Geo. C. Rose, in the Blue Rock Mine at Georgia Slide, El Dorado Co., to deposit tailings behind the dam of the Gold Bug Mine in Canyon Creek; from A. B. Driesbach and J. F. Dudley, in the Driesbach & Dudley Mine near North San Juan, Nevada Co., to deposit tailings in Shady Creek; from Wm. E. Moore and John Isbister, in the Fair View Mine at Sweetland, Nevada Co., to deposit tailings on a flat below the mine; and from David Cabona and John Romano, in the Imperial Mine near Sierra City, Sierra Co., to deposit tailings in old pits below the mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on May 16, 1898, at 1:30 P. M.

THE ROESSLER & HASSLACHER CHEMICAL CO.
100 William Street, New York.

CYANIDE

Peroxide of Sodium

Hyposulphite of Soda

Chloride of Lime

Sulphide of Iron

Trade Mark.

And other Chemicals for Mining Purposes.

WANTED.—A practical mining man, with business ability, thoroughly experienced in mining engineering and the economical working of ores, desires a position as manager or superintendent of a quartz mine. Reasonable salary, and good references. Address "D." this office.

FOR PROSPECTORS.

A book written by a prospector, giving information on methods and appliances used by frontier miners. By mail, Twenty-five Cents, postpaid. Address "Prospector," Mining and Scientific Press office, 330 Market St., San Francisco.

MANGANESE MINES FOR SALE.

High assay; 30-foot ledge; easily reached; timber, water, etc. For particulars, address J. H. COOK, Potter Valley, Cal.

Assayer Wanted

FOR CENTRAL ARIZONA,

Who has a button and pulp scale or outfit complete. Single man. Must be able to check against smelters and be thorough. Wages $60 per month, with board and room. Must furnish references as to ability as assayer, also honesty, sobriety, etc. Address ARIZONA, Mining and Scientific Press Office, San Francisco, Cal.

FOR SALE.

CONCENTRATOR.

Adapted for copper, lead or zinc ores; capacity 30 to 50 tons per day; complete, new, first-class, and in perfect running order; delivered on cars, cheap for cash, with or without the steam power plant. For specifications, address P. K. MINING CO., Antelope, Idaho.

FOR SALE OR EXCHANGE FOR GOOD FARM,

A deep gravel mining claim of 9½ acres near Columbia, Tuolumne Co., Cal. Water ditch above claim. Plenty fall for working. A portion of surface has been worked. Bedrock has not been reached. Title U. S. Patent. Prospective buyers will be allowed to prospect claim.

Inqu re of FRANK WILLIAMS, 3rd Street, near Holyoke, West Berkeley, or TONY ENNIS, Columbia.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

Practical Running of Dynamos.

A little booklet on the Care, and the Locating and Remedying of Troubles in Dynamos and Motors.

PRICE 10 CENTS.

Catalogue B. Mechanical, Electrical and Mining Books sent free.

PHILADELPHIA BOOK CO.,

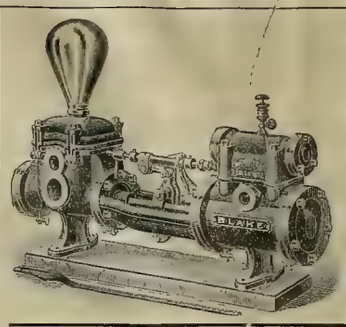
Reasons Why Inventors Upon This Coast Are Advised To Consult With Us:

First: Because they have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that they will get all the inventor's ideas correctly and not be liable to make mistakes.

Second: In addition to this we have resident attorneys in Washington, of long experience and high standing with the office, who attend EXCLUSIVELY to our business before the Patent Office. You have, therefore, the advantage of personal consultation in the preparation of the case, and constant attention to your application after it has been filed.

Third: Time is saved. If you send to an Eastern attorney you must depend upon your ability to write a perfect explanation to a person three thousand miles away, wait until the papers can be returned to you for signature, and then send them again to your agent to be filed, if they are fortunate enough not to need further revision and return.



Experience in preparing patent applications here and in the East has proved to us that superior work can be done here.

We have been credited with obtaining more patents in proportion to the number of applications made by us than any other firm in the business.

We have had a continuous experience in this business of over thirty years. We have the most complete Patent Library west of the Mississippi river, including full certified copies of all patents issued for the past twenty-five years. We keep these for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches and opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid. $1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid. $1 75

Prospector's Field Book and Guide.
By H. S. Osborn. $1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid. $3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated. $5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid. $5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid. $6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated. $5 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth. $1 50

Quartz Operator's Handbook.
By P. M. Randall. $2 00

Skeleton Mining Report.
Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid. ..... 50 cts.

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid. $2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G Warnford Lock. 472 pages, illustrated, flexible leather. $5 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth. $4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth. $5 00

Book Notices.

...Mechanical Drawing:" Jno. S. ...eld, 8vo; pp. 128; 168 illustrations; a text-book from which to learn the elements of mechanical drawing, adapted to students in mine, electrical, railway and mechanical engineering, and of general value to draughtsmen and others; Jno. Wiley & Sons, N.Y.; $2.

"Machinists' and Engineers' Pocket Manual:" J. B. Dixon; pp. 371, illustrated; rules and solved problems regarding steam engines, steam boilers, steam pumps, etc., and data of value in the machine shop; Laird & Lee, Chicago; $1.

"The Resistance and Propulsion of Ships:" W. F. Durand; 8vo; pp. 461; 116 illustrations; a fine book of unusual value and great present interest, being a clear, intelligent presentation of the entire subject from the scientific standpoint of the modern engineer. Even to those not intimately connected with the matter, the book commends itself as a means of practical information; Jno. Wiley & Sons, N. Y. City; $5.

"Hydraulic and Placer Mining:" E. B. Wilson; 8vo; pp. 234, profusely illustrated. In the preface to his work, the author says: "The present activity in placer mining arises from the unprecedented demand for gold. Simultaneously with this demand new sources of supply are discovered, and obstacles which, in California at least, temporarily prevented placer mining have been satisfactorily surmounted. New and improved machinery has been introduced, which admits a wider range of such deposits being exploited. The author here acknowledges the kindness of the Risdon Iron Company and the MINING AND SCIENTIFIC PRESS of California, also the *Scientific American* of New York, for illustrations which appear in this book. He is also indebted for information to the manufacturers whose names are inserted. The method of presenting the subject matter, he trusts, will be of substantial benefit to those interested in placer mining."

Reliable information and useful tables commend the book to the hydraulic miner everywhere; Jno. Wiley & Sons, N. Y. City; $2.

SOME experiments regarding the ability of water to exercise a destructive influence on iron pipe, recently made, have yielded results not generally expected. It has been ascertained that waters containing a little lime, but an appreciable quantity of dissolved carbonic acid, were observed to exercise a solvent action on the iron, and the course of the action was traced. A known quantity of iron filings was placed in each of three vessels, which were respectively filled with ordinary river water, and the same water after carbonic acid had passed through it for a few minutes, and after the addition of sufficient lime to just neutralize the carbonic acid. The vessels were sealed by mercury from contact by the air, and, after the lapse of a certain time, the iron dissolved in each case was determined. In the first case the water had dissolved about $\frac{3}{1000}$ per cent, in the second $\frac{2}{100}$ per cent, while in the third only traces of iron could be discerned. The water in the second case was clear, but on standing exposed to the air ferric oxide separated. It was, therefore, inferred that water containing carbonic acid and every little lime dissolved iron as ferrous carbonate. The latter is then decomposed by the oxygen of the air and ferric acid is deposited and carbonic acid formed. The latter can again attack the iron, and thus water containing little carbonic acid may have a powerful action upon iron pipes.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal

ORES! ORES!

Gold, Silver and Lead Ores and Concentrates

PURCHASED AT REDUCED RATES FOR TREATMENT.

SELBY SMELTING & LEAD CO.

416 Montgomery St., San Francisco.

Consign shipments to Vallejo Junction, Cal.

Pat. Apr. 20, 1897; Pat. Jan. 4, 1898.

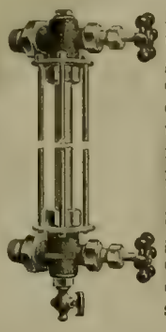
THE HEDGE GOLD EXTRACTOR, for Quartz Mill Work. A machine at last that takes the place of the apron plates in quartz mills, and will make a saving of 10 to 50 per cent over any other process. Simplicity of construction and operation. Large amalgamating surface and a complete and perfect contact. No scouring; no loss of quicksilver. Can easily be kept clean and in order. Durable, practical and economical. Built in three sizes. Price $150, $300, $400. Capacity 4, 10, 20 tons per 24 hours. Weight 175 lbs, 450 lbs, 600 lbs. PACIFIC MINING MACHINERY CO., 127 First St., S. F., Cal.

Assaying Gold .....AND..... Silver Ores.

By C. H. AARON.

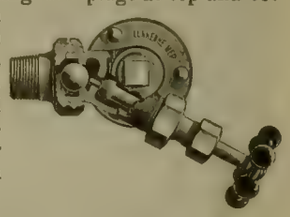
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 128 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.



MICHIGAN COLLEGE OF MINES.

Supported by the State of Michigan. Practical work. Elective system. Special advantages for men of age and experience. For catalogues address

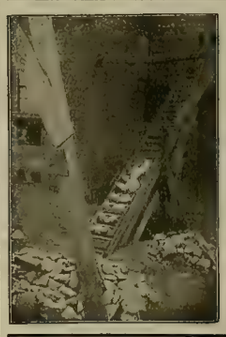


DR. M. E. WADSWORTH, President.
Houghton, Michigan.

Lunkenheimer's

AUTOMATIC WATER GAUGE

Is constructed on practical principles and can be relied upon to be "Automatic" in closing off steam and water should glass break. This gauge possesses advantages not found in other makes. It can be made, when so desired, either right or left hand by simply reversing the plugs at top and bottom of gauges. Made of gun metal, carefully finished and rigidly inspected and tested. Warranted strictly first-class. Specify "Lunkenheimer's" and get the best. Supplied by dealers everywhere. Write for catalogue of brass and iron steam specialties.



THE LUNKENHEIMER CO., Cincinnati, Ohio, U. S. A.,
SOLE MANUFACTURERS,
26 Cortlandt St., NEW YORK. ✦ BRANCHES: ✦ 35 Great Dover St., LONDON, S. E.

Hoisting Engines

operating on GASOLINE, DISTILLATE or CRUDE OIL. Both Friction and Geared Hoist, from 10 to 50 H. P., for Mines, Quarries, Docks, etc. Great Saving over steam, especially where wood, coal or water are scarce. Send for catalog. Guaranteed fully. State size wanted. Address Weber Gas and Gasoline Engine Co., 430 S. W. Boulevard, Kansas City, Mo.

Modern Methods

As Applied to the Handling of Freight, Grain, Ores, Raw and Manufactured Products.

MALLEABLE IRON BUCKETS, Approved Pattern and Weight; ROPE POWER TRANSMISSIONS, SHAFTING, PULLEYS, GEARING, CLUTCHES, Etc.; ELECTRIC COAL MINING MACHINERY.

—MANUFACTURERS OF—

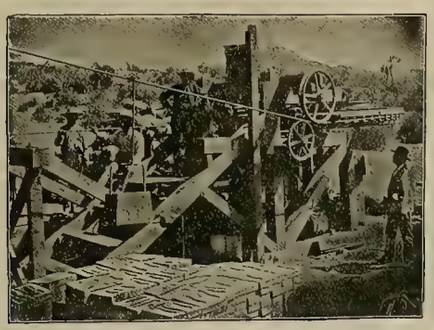
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

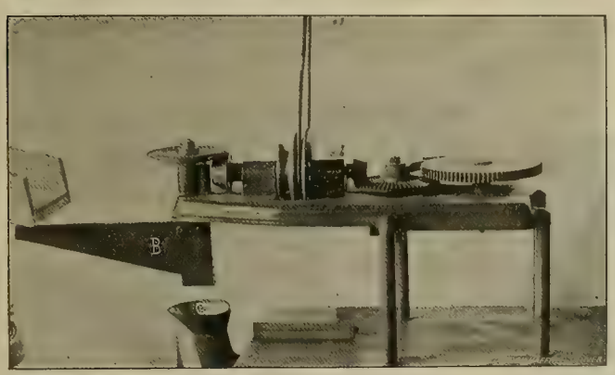
EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

Stands pre-eminent for the transportation of Ore, Fuel and other materials over mountainous and rugged country.

Parties desiring to remove large quantities of Sand, Gravel, Earth, Ore, Rock, to construct Dams, Levees or Embankments, etc., can do most efficient work at less cost by the



Hallidie System of Ropeway Transportation

Than by any other known system.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

A Submarine Torpedo Boat.

The reduction of Matanzas, Cuba, by the American fleet in command of Rear-Admiral Sampson, demonstrates the skill of the American gunners, and, as the first naval action in Atlantic waters for thirty-three years, attracts world-wide interest. In connection with naval movements the question of submarine torpedo boats is of present interest. As pointed out by Capt. Jaques in an address before the Institute of Naval Architects on the 1st ult., the generally accepted type of torpedo boats is one which has not come to stay; there is evidence enough in the results that obtained in the late Japan-China war, in the discomfort of life on board, in the accidents incident to maneuvering, their unfitness for serious work at sea, the great fatigue to which the crews are subjected, and the marked strides in torpedo-boat construction to reach speed, protection and a reasonable defensive power to convince us that the present torpedo craft, whether she be carried on a battleship or as a torpedo-boat destroyer, is neither sufficiently protected nor invisible, nor can she keep the seas without ruining her personnel or meeting destruction.

The torpedo-boat experience gained in the Japan-China war demonstrated the fact that the ordinary torpedo boat had more defects than enduring or re-

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—Submerging Torpedo Boats; Armored Submerging Torpedo Boats, 485. Cook Mine, Blackhawk, Colo.; Hoist, Cook Mine, Blackhawk, Colo.; Interior Shaft House, Cook Mine, Blackhawk, Colo., 489.

EDITORIAL.—A Submarine Torpedo Boat, 485-489. New Tunnel Site Statute; Sulphur in California; Caminetti Act Constitutional; An Important Meeting; Some Comparative Figures; Some Questions Answered; Miscellaneous, 486-487.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 493-94.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 505.

MISCELLANEOUS.—Equipment of a Colorado Mine, 488. Conditions of a Good Result from Amalgamation; Discussion on "Treatment of Slimes;" Dredging Plant for Boise River, 490. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 491. American Goods in Europe; Sampling Ores for Assay; Submerged Valleys on the California Coast; To Stand Off Mosquitoes, 492.

"LUMBER," in a recent issue, says:

The timber wealth of the United States gives a yearly product of over $1,000,000,000, or twice the value of the entire output of all the mines together—gold, silver, coal, lead, iron, copper and zinc.

Without decrying the extent or value of the timber business, it is in order to note the inaccuracy of "Lumber's" figures. The value of the mineral output of the United States for '97 was, approximately, $800,000,000.

THE great force of the water issuing from the nozzle of a monitor used in hydraulicking was fearfully illustrated in Placer Co., Cal., last week. T. H. Hobson, while piping at the Horseshoe Bar mine, on the American river, below Michigan Bluff, lost control of the monitor and was thrown some distance. He attempted to rise and the stream of water struck him in the back, killing him instantly. He was a son of J. B. Hobson, at present managing the Horsefly mine, Cariboo, B. C.

UNRESTRAINED by telegrams or red tape, Commodore Dewey, with his American squadron, forced the Manila defences last Sunday, fought the forts and fleet, silencing the former and annihilating the latter. Seen or unseen, the signal flashed along the fleet was doubtless "Remember the Maine." American courage and science went up against superstitious tradition, and the first great sea fight since our civil war showed the prowess of the American navy and "the man behind the gun."

ON the first of next month the Transmississippi and International Exposition opens in Omaha, Neb. The Governor of California has appointed M. H. De Young Commissioner-General of this State; the Commissioners in charge of the exhibit are Messrs. Wooster, McMurray, Mills, Johnson, Ford and Easton. The Commission has held one meeting and has agreed that the time is short to raise the $10,000 required to secure appropriate representation. It was further agreed that, if practicable, the State Mining Bureau's collection should be sent to Omaha; and likewise the State horticultural exhibit. It is a matter of regret that our esteemed Governor was unable to appoint the Commission a little earlier in the year.

THE new U. S. Surveyor General, Gleaves, who succeeds W. S. Green, has taken office in San Francisco. He immediately put deputies at work on mining claims awaiting action, so that they might be passed on by the Land Office and speedily finish the work. Mining claims hereafter will be promptly acted on by the Surveyor General. "The miners are entitled to good treatment by this office," he says. "The greater part of the revenue of this department comes from the miners, and if it were not for them this office might be considered unnecessary. Nevertheless, their claims have not been acted on here for six months, sometimes. My purpose is to dispose of each claim without delay when it is presented, and the miners will have to wait only a few days instead of several months, as formerly."

An Important Meeting.

In sixty days the International Mining Congress will hold its second annual meeting at Salt Lake City, Utah. It is important, for a variety of reasons, that California be appropriately represented; this is a matter upon which all seem to be agreed, though for some unexplained reason the names of the delegates from California have not yet been announced. Secretary Johnson reports that so far he has the names of about three hundred appointed delegates, coming from seventeen States, from Florida to Oregon. The deliberations of this Congress will be important to the mining industry in this west half of America, and California should be properly represented. The scope and character of the topics discussed by this body are best indicated by the following, which were among the questions discussed at the first meeting, which was held in Denver last July: The demand for a Federal Secretary of Mines and Mining; Federal and State legislation as affecting mines and mining; Federal and State statistics of mines and mining; Gold mining a safe proposition, gold value being established by law; The relation of gold and silver in mining the precious metals; Does gold and silver production keep pace with the increase of population and the demands of commerce? Can enough gold be mined to safely make it the only redemption metal money? The opening of Indian lands that have mineral deposits; Mineral lands and their development offer opportunity; Are the timber reservations and Federal reserves injurious to the development of mining? Progress made by science and improved methods of saving the precious metals in the past twenty-five years; Hydraulic and placer mining; Does the known area and gold deposits of placers offer opportunity for profitable development? Railroad transportation and improvement of county wagon roads necessary for the increase and development of mining.

Some Comparative Figures.

In last week's issue appeared the official figures of California's gold yield by counties for 1897, as compiled by Mr. Chas. G. Yale, statistician to the U. S. mint at San Francisco, with some comparative comment.

Through the further courtesy of Mr. N. C. Ray, of Coulterville, Cal., the following table is presented, which graphically shows the per cent of increase and decrease in each county's product as compared with '96, the rank of the several counties as gold producers for the two years, etc.:

Caminetti Act Constitutional.

The most important mining event of the week, though a foregone conclusion, was the decision of the United States Circuit Court of Appeals in the case of the North Bloomfield Gravel Mining Co. against the United States, in which Judge Hawley, who rendered the decision of the court, said that the question to be decided was whether the Act of Congress of March 1st, 1893, was mandatory or not. He held that the law was mandatory, that the United States Congress had power to make such a law, and that the North Bloomfield Co. would be obliged, if it operated its hydraulic mine, to secure a permit from the California Debris Commission. The history of the case is doubtless familiar to most of our readers.

Judge Ross, in the United States Circuit Court, last June held that the Caminetti Act was constitutional. The action was to enjoin the North Bloomfield Company from carrying on hydraulic mining until it complied with the requirements of the Caminetti Act. The complaint set forth that the company had failed to ask of the California Debris Commission a permit to carry on hydraulic mining, and that proper provision had not been taken to prevent the debris from being carried into the navigable streams below.

The defendants denied that debris from their mines impeded navigation and attacked the constitutionality of the Caminetti Act.

Judge Ross upheld the constitutionality of the Act and the right of the Commission to regulate hydraulic mining. In concluding his decision, he used the following language:

So here Congress has created a commission under the direction of the Secretary of War and the supervision of the chief engineers of the army to ascertain whether the various hydraulic mines within the territory drained by the Sacramento and San Joaquin river systems can be operated by impounding and other reservoirs without injury to those navigable waters; and if so the Act of Congress permits them to be operated in such a prescribed way as will prevent any such injury. Until the matters of fact committed to the commission have been ascertained and the extent and methods of the work are prescribed, the Act of Congress prohibits the operation of any mine by the hydraulic process within the territory drained by the Sacramento and San Joaquin river systems from which any debris matter flows into those waters.

This, in my opinion, is the true construction of the Act, and to it as thus construed I see no constitutional objection. It is too late now for any one to question the power on the part of Congress to declare that debris of any character, or other thing, constitutes an obstruction to the navigable waters within its control and to prohibit the use of such waters or other thing. The power to prevent absolutely the use of such waters for the objectionable purposes necessarily includes the power to prescribe the terms and conditions upon which they may be so used.

The provision of Section 10 of the Act, requiring the surrender to the United States of the right to regulate the manner in which the debris resulting from the working of such mine or mines shall be restrained and what amount shall be produced therefrom, only constitutes one of the conditions to such use required by Congress. As Congress already had that power of regulation it needed no conveyance from the mine owner to vest it. For this reason the insertion of that requirement by Congress as a condition to the granting of a patent to mine by the hydraulic process does not render the Act obnoxious to any of the objections urged against it. A decree will be entered for the complainant as prayed for.

The Court of Appeal, in upholding the above decision this week, went into the subject at considerable length, and among other things said:

The references already made and the provisions quoted clearly show that the Act of Congress means just what it says. When it declares that certain things must be done before any permit is given, it means that they shall be done. And if these things are not done, as therein provided, no permit can be issued; and if none is procured, the working of the mine by the hydraulic process is prohibited and made unlawful. The language and terms of the Act when viewed in the light of the history of the times and all the surrounding conditions are clear, certain, positive and mandatory. Any other view would unquestionably lead to absurd results, which all courts declare should be avoided in the construction of any statute. There would be no positive protection either to the miners, farmers or the Government; litigation and strife, which it was the object of the statute to avoid, would continue to reign supreme.

Under the law mine owners engaged in hydraulic mining have no right to use the streams without the permission of the commissioners appointed under the

provisions of the Act. In other words, the Act of Congress, of itself, prohibits all hydraulic mining unless its terms are first complied with. The whole case is virtually disposed of in the conclusions already reached—that the Act is mandatory and constitutional.

The navigable rivers being the property of the nation, it follows that any injury to them which affects the commerce of the country is an injury to property rights, and the mere fact that penalties are imposed upon all parties found guilty of violating any of the provisions of the Act does not of itself prevent the issuance of an injunction to protect the property rights of the Government in the rivers. Wherever commerce among the States goes, the power of the nation, as represented by the courts of the United States, goes with it to protect and enforce its rights.

Under the provisions of the Act, hydraulic mining in the territory named is prohibited unless the terms and conditions which it imposes are complied with. If these provisions are detrimental and injurious instead of beneficial to the mining interests which it was intended to foster, encourage and protect, the efforts of all those interested in that particular business should be directed to have it repealed or amended instead of attempting to evade it or destroy its efficacy. While it remains the law on this subject, it must be obeyed.

Sulphur in California.

In the issue of April 16th appeared an article on "Sulphur and Sulphur Products," in which reference to sulphur deposits in California has elicited inquiry from several sources for further information thereon.

Some years ago sulphur was produced in considerable quantity from deposits on and near the eastern shore of Clear lake, Lake county. Works were put up and run for several years, but operations appear to have been unprofitable. The vicinity of Sulphur Banks mine is reported to have furnished for some time the supply of the California market—at that time 700 to 800 tons annually.

The sulphur deposits on the eastern side of the valley, in Kern county, occur principally as superficial deposits covered in many places with drift from the mountains. The deposits in the Sunset oil district cover an area of several acres. Prospect holes show one deposit made up of high and low grade ore, some of it nearly pure sulphur, but for the most part it consists of a drift cemented with sulphur. Similar occurrences are reported in the same region.

Sulphur occurs at various places within this State, but the known localities of its occurrence do not, it is believed, contain important or extensive deposits. Mention is made of this mineral in a number of the various reports of the State Mineralogist. In the eighth report it is said to occur in Mendocino county, also in Lake and Colusa counties. Mention is also made of the occurrences in the same counties in the tenth, eleventh and twelfth reports, and in the eleventh and twelfth reports the occurrence of the mineral in Kern county is described. Some sulphur was at one time shipped from localities along Sulphur creek, Colusa county. In the same county deposits are mentioned near Wilbur springs and at the Elgin mine. In 1891 attempt was made to work the sulphur on the Elgin property, but with little success, and the sulphur produced, although of 88%, was black sulphur, and not acceptable to the California market.

On the 26th ult. the Superior Court of Shasta county, Cal., held that the new mining law of the State of California, which went into effect May 26th, '97, is constitutional. Action was brought to quiet title to the Sprague mine, near Shasta. The plaintiff offered in evidence his notice of location of the property. The location blank was of the form used under the old law and was made of record on December 8th, '97, or twenty days prior to the alleged entry of the defendants upon the property. The plaintiff objected to the admission of the instrument in evidence on the ground that it did not comply with the new law, which was then in full force and effect. The court sustained the objection, thereby holding that the new mining law is constitutional. So far as known this is the first favorable decision thereon and the second time that the matter came up in court, the first being a contrary decision in July, '97, by the Superior Court of Mono county, Cal.

The congressional bill previously noted, providing that owners of mining claims shall not forfeit for failing to perform the assessment work upon them provided they enlist for war, passed the U. S. Senate last Monday.

New Tunnel Site Statute.

The lower house of Congress recently passed the bill introduced by Congressman Bell of Colorado to change the Revised Statutes of the United States relative to tunnel sites. The bill, which has been noticed heretofore herein, was recommended by the Secretary of the Interior and by the Commissioner of the General Land Office. The report of the committee which had the bill in charge was as follows:

A discovery from the surface entitles the miner to 1500 feet in length and 600 feet in width, and also the same area when the discovery is made in a tunnel. Tunnels are usually run at right angles to the general course of the veins. The Supreme Court has held that the tunnel claimant may take his whole claim on either side of the tunnel that he may desire after he cuts the vein, and he is required to give no notice nor to protest against anyone applying for a patent on any ground within 1500 feet of the line of the tunnel. Yet when he cuts a vein in the tunnel he may take his claim all on one side, though it covers ground actually purchased of the Government by others within the 1500 foot limit.

The evil that section of the bill seeks to cure is to confine the rights of the tunnel claimant to 750 feet on each side of the line of the tunnel, should the extension of the claim beyond 750 feet from the line of the tunnel conflict with the rights of any prior locator. If the tunnel claimant does not conflict with any other locator he may, under Section 1 of this bill, take a full claim on one or both sides of the line of the tunnel. As the law now stands the claimant is entitled to only 1500 feet of the vein, but, not being confined to either side or to any portion on one side and the remainder on the other, and having the right to choose his whole claim on either side, or a part on one side and the remainder on the other, renders anyone locating a claim within 1500 feet of the line on either side of the tunnel subject to the will of the tunnel claimant of he cuts the same vein, or in effect severs it, and there are 3000 feet in width out of which he can only extend his lines 1500 feet.

Section 2 simply requires a tunnel claimant to stake his claim at the surface and record the claim within sixty days from the time the vein is cut; otherwise it will be deemed that he has abandoned the same, should any locator discover the same claim outside of the tunnel and locate the same. These lands are sold by the Government to the claimants for $5 per acre, and the interest of the Government, as well as that of the prospectors, requires that there should be no ambiguity about the intention of claimants or as to the specific ground desired.

Section 3 of the bill gives the claimant all ore from the point touched to the surface, even though the apex of the vein may depart from the side lines.

The matter is of considerable local interest in Colorado and of general importance throughout the United States. It is believed that the bill will pass the Senate and become a law practically in the form given above.

In an article in Science, reviewing the progress of geographical work in this country, Marcus Baker of the U. S. Geological Survey shows that twenty years ago a reorganization of the system of national surveying resulted in the present United States Geological Survey, created in March, 1879. It replaced the prior organizations, familiarly known as the Hayden, Powell and Wheeler surveys. The work laid out for the newly-created Geological Survey was geological, and its field the national domain. "What is the national domain? Is it restricted to the Territories and places actually occupied by the United States, or does it embrace every spot where the Stars and Stripes may float? Congress, after a long debate, answered this question and authorized surveys to be made in every part of our whole Union. Again, geological investigations cannot be satisfactorily made, nor geological results satisfactorily exhibited, without maps, topographic maps—i. e., maps which show the shapes and forms, as well as positions on the surface. Such maps did not exist. A fragment here and there, to be sure, existed—a fringe of sea and lake coast; but these constituted only a bare beginning. Accordingly, in 1882, authority was given, and the beginning of the mighty task of making a topographic map of the United States was begun. That work has for sixteen years progressed without interruption, and to-day we have contour topographic maps covering more than 600,000 square miles. In almost every State and Territory in the Union work has been done, while Massachusetts, Connecticut, Rhode Island, New Jersey and the District of Columbia are completely mapped. That the prosecution of this work and the distribution of the maps has profoundly influenced interest in and knowledge of geography in the United States goes without saying. These maps are in the hands of engineers, of projectors of improvements, of teachers, of text-book makers, and of geographic students everywhere. The standards of school geographies have risen, methods of geographic teaching have been changed, and a better understanding of the relations of environment produced. And thus the first century of progress in geography ends with a rate of progress, both in research and teaching, never surpassed. That which has been already accomplished is great; yet it is but a small part of that which remains to be done."

Some Questions Answered.

A Florence, Idaho, subscriber asks: I. Will an *amended* location notice hold a quartz claim, when recorded, where no original location notice is recorded? II. A locates the Bonanza lode, but makes his location across the vein. B makes a discovery inside A's line, but over 400 feet from the Bonanza vein; has B a valid location, viz: does A's end lines become his side lines?

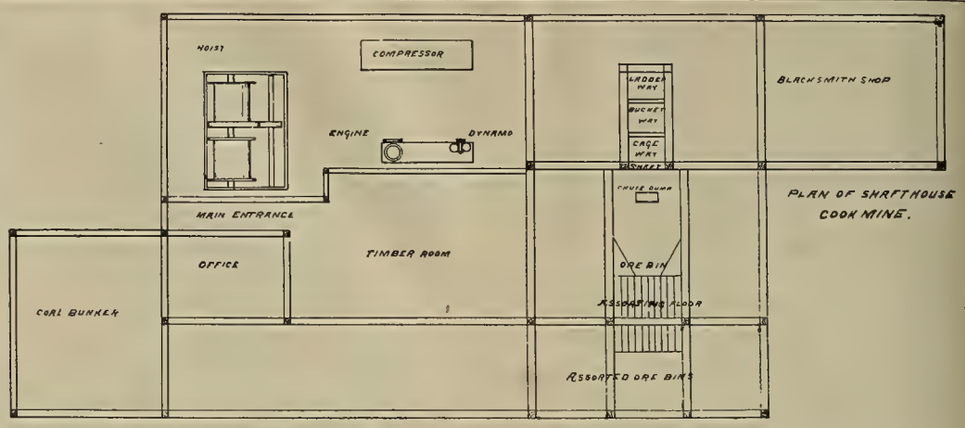
I. A location may be amended at any time, provided intervening rights are not affected. The fact that the original location notice is not recorded will not affect the validity or operative force of the amended notice, provided there are no intervening rights. In such a case the amended notice will take effect as of its date and be considered an original notice.

II. When a locator locates crosswise of his vein, his so-called side lines become end lines. In such a case his true side lines must be constructed with reference to the ascertained course of the vein, i. e., parallel with and not more than 300 feet on each side of the center of the vein. If the width as originally marked is excessive, the excess should be cast off, so that the middle of the vein shall be in the center of the location. The area thus excluded is subject to appropriation. A's discovery in the case illustrated, being within the excluded area, may be made the basis of a valid location. We understand this to be the rule announced in Taylor v. Parmenteau (Colo.), 48 Pac. 505, Bonner v. Meikle, 82 Fed., at page 705, and Lakin v. Dolly, 53 Fed., 333.

An Etna, Cal., reader writes:

I am interested in four unpatented placer claims, equal subdivisions of a parallelogram, each consisting of eight locations of twenty acres—160 acres in each, or a total of 640 acres. First, is each of the four claims considered, under the latest ruling, "a claim" or "a group of claims?" Are the four claims taken together considered by the law as "a group of claims?" There has been expended upon each claim—160 acres—more than the $500 required before patent can be applied for. As it is now too late for me to get a patent before July 1st, '98, must I expend $500 on each of the twenty-acre locations before I can apply for same? Can I get patent for the whole 640 acres in one body or must there be four patents?

A placer location covering 160 acres is considered as one claim by the Land Department. If the four claims are contiguous, it is one claim or group until July 1st, '98; and $500 expenditure is sufficient for patent; after that time each location of 160 acres will be considered by the Land Department as a separate claim in patent proceedings, and $2000 worth of work will be necessary; but all may be patented under one application if adjoining each other either before or after that date. If more than $500 has been expended on each claim, that is all that is necessary under rule 53. It is assumed that the questioner means that eight locations are united in each 160-acre lot, and the foregoing is based upon that assumption. If as a fact they are in thirty-two twenty-acre locations, $500 worth of work will have to be done upon each one after July 1st, '98, to entitle the applicant for patent. It would require a separate application for each lot or location if the same are separate or cannot be joined either before or after that date.



The feasibility of draining the Comstock, Nev., mines, and resuming deep mining therein has been pointed out in several articles in this paper in the last three years. Negotiations looking toward a realization of the idea have been in progress for some time. Plans for pumping are now under consideration, and it is hoped that the work of pumping will shortly be begun in the Yellow Jacket shaft.

Equipment of a Colorado Mine.

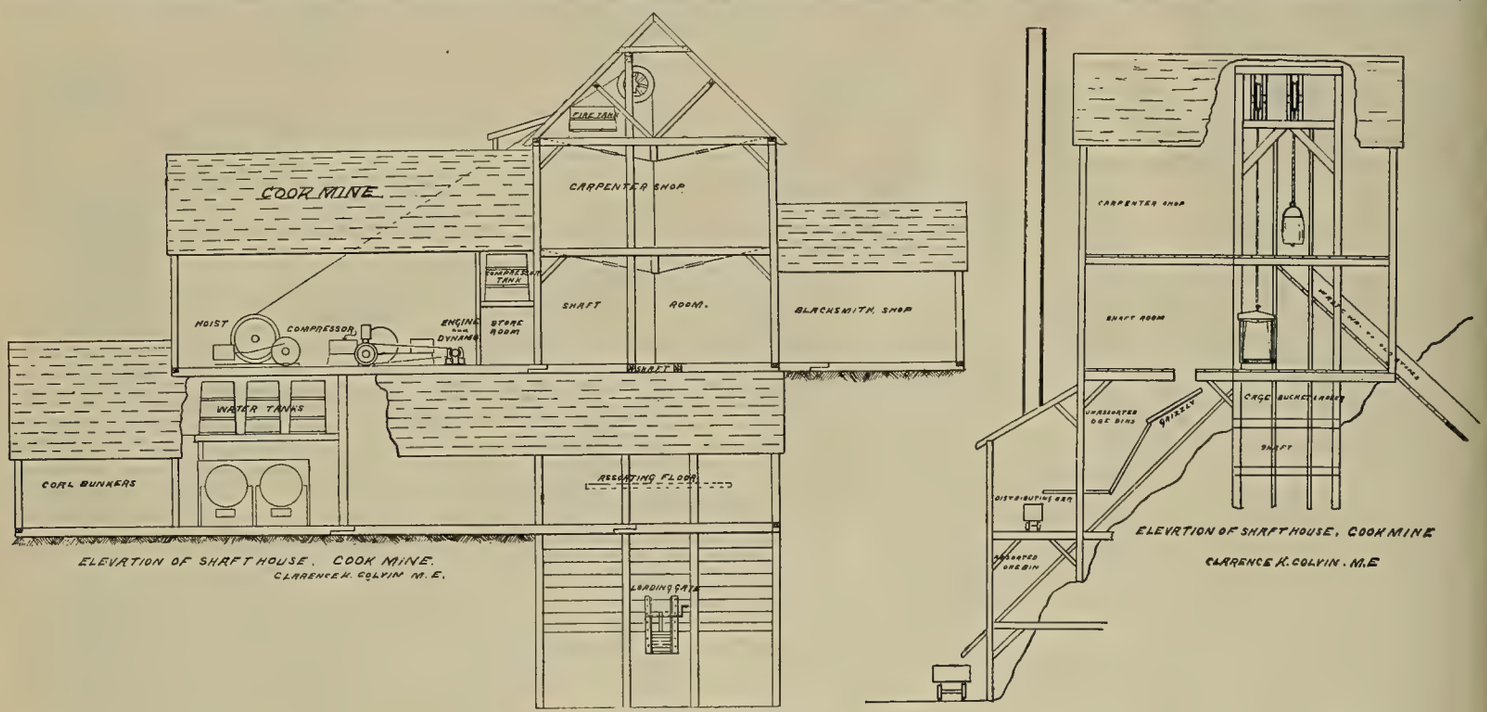
Herewith is illustrated the shaft house plans and equipment of the Cook mine at Blackhawk, Gilpin county, Colorado, which property was recently sold to a Boston syndicate by M. P. Dalton of Denver. The property is on Gregory hill and adjoins the Fisk mine, some of whose stockholders are also stockholders in the Cook. The new shaft house and plant of machinery are set over a new three-compartment shaft, consisting of cage, bucket and ladder ways. The plans of the shaft house and arrangement of machinery plant are those of Clarence K. Colvin, M. E., the mine manager.

The machinery, which was furnished by the Hendrie & Bolthoff Manufacturing and Supply Company of Denver, is of the latest and most improved pattern. The two 80 H. P. return, tubular boilers are each 60 inches by 16 feet and are fed by a Knowles duplex boiler-feed pump, which forces water from tanks into which the exhaust steam from the entire plant is delivered. The building and other arrangements contemplate the possible addition of other similar boilers in the future.

The hoisting engine is the Webster, Camp & Lane make, being their combined gear and band friction type, with two drums 5 feet in diameter and 33-inch face, grooved for 1-inch round rope and to hold 3000 feet of same. The cylinders are 14 inches in diameter, with 18-inch stroke. The throttle valve is of an improved design, which enables the operator to stop or start the cage without shock or jar, and the arrangement of the drums is such that they work either independently or simultaneously, permitting the operator to raise with one and lower with the other, or raise or lower with both at the same time, indicators always designating the position of cage or bucket. In this hoist is said to be used for the first time in Colorado a large rawhide pinion with cut steel gear. A similar but smaller pinion of this kind was put in on one of the engines at the Elkton mine by this firm, which proved so satisfactory that its adoption was decided on in this case. The hoist weighs 55,000 pounds and is set on a grout foundation 8 feet deep.

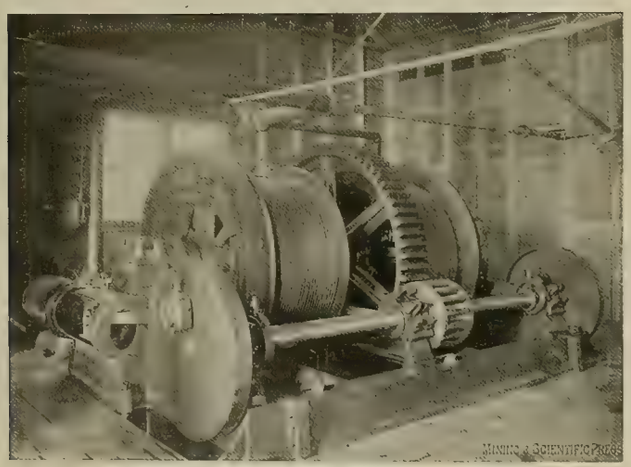
COOK MINE, BLACKHAWK, COLO.

The air compressor is a 16x16 compound Norwalk and supplies air for four 3-inch rock drills and for forges and pneumatic hammer used in swaging and sharpening drills.



Two air receivers, one at the surface and the other in the mine, supply good, dry air to the drills in drifts and levels.

A high-speed Sturtevant automatic engine is used to operate an electric generator, by which the mine is lighted, and to operate a small timber-framing machine. A new device in the shape of a guide frame keeps the bucket in the center of the shaft.



The new shaft above referred to is now at a depth of 150 feet and will be sunk rapidly to the 400-foot and 500-foot levels, which up to this time have been entered and developed through the Fisk shaft. The completion of this shaft will enable the company to work to greater advantage. In the 100-foot level, run from the main shaft a distance of 250 feet, a body of ore from 4 to 6 feet wide has been encountered, from which shipments are being made. On the 500-foot and 600-foot levels are ledges of ore from 6 to 20 feet wide. The ore throughout is an iron and copper sulphide, the principal values being gold and copper. The mill dirt averages in value from three to four ounces per cord, about 50 per cent of which is saved on the plates. The concentrates, reduced to one and a half to three tons per cord, run from $15 to $30 per ton. Approximately 10 per cent of the entire product is smelting ore and runs about $40 per ton. About 80 tons per day are being hoisted, one car per day of which being concentrating and smelting ore.

WASCOTT.

A Submarine Torpedo Boat.

(Continued from page 485.)

liable qualities, and there must be some radical change in the present torpedo-boat architecture.

The desire or attempt to produce a submarine boat for war purposes is not new, nor have the controlling elements of design been restricted to one principle, except in the Holland system.

The leading and most generally accepted principles of the present battleship were taken from the American monitor, a type that for many years was practically discarded, but which during the war of '61-'65 completely, though against the ideas of naval officials, gained such a decisive victory and imposed conditions on subsequent naval architecture that have been universally accepted. If Ericsson's monitor had not had the opportunity of war to prove her value, it is doubtful if she would ever have had such an important place in history or naval architecture. All treatises on torpedo boats, all reports in connection with their construction and supply, all references to their achievements, emphasizes the requisite of invisibility and power to reach an enemy, and to successfully get torpedoes into an enemy's ship.

The development of the submarine boat, its power to disappear, its ability to move quickly, its valuable element of submergence, the practicability of protecting by armor, its limited visible portion, and the surety of its fish-like qualities, must have a radical influence in modifying the present types of torpedo craft, no matter whether it replaces the second-class torpedo boat on board a battleship, whether it is employed for submarine purposes pure and simple, or its submarine principles utilized to protect the semi-submerged torpedo boat and to meet the practical conditions sought for in combining such invisible and protective qualities as will enable the torpedo boat to surely get in her work.

Before describing the two submarine boats, the "Plunger" and the "Holland," now receiving so much attention, a few words about the four boats built under Mr. Holland's direction, and in and with which he made the experiments that made his final success possible.

The first one was built in 1877 by the Albany City Iron Works of New York. Her dimensions were 14½ feet long, 3 feet beam and 2½ feet depth; she had a double body, the inner one being cylindrical; water space between them. She was operated by a 4 H. P. petroleum engine with one screw, and had vertical horizontal rudders.

Mr. Holland experimented with this boat for nine months, and, although her petroleum engines were a failure, and the speed was very unsatisfactory, he proved that he could submerge her at will and keep her under water, and determined that the horizontal rudders were useless when placed in the transverse axis, but effective when at the stern.

After he demonstrated that it was possible to control the boat under water, he had the engines pulled out, and sank it under the Falls bridge at Paterson, N. J., where the hull now lies in the Passaic river.

Boat No. 2 was commenced in 1879 at the Delaware Iron Works, New York City. She was finished and delivered to Mr. Holland in April, 1881; he started experimenting with her immediately, and continuing until October of that year. In that boat he made most of his experiments. She was 31 feet long, 6 feet in diameter, nineteen tons displacement, and was fitted with a 15 H. P. Brayton petroleum engine. With a crew of one engineer and himself he cruised all over the harbor of the North river. Most of his experiments were made under water. As an example of the perfect control of pressure, Mr. Holland relates that, with the boat submerged and resting on a gravel bottom, the engineer opened a bottom manhole, stepped out (without a diving suit), lifted the hull slightly with his hands, and then got in again and closed the manhole.

With her armament of a submarine gun 10 feet 2 inches long and 9-inch bore, he succeeded in getting a perfectly straight projectile trajectory under water for about forty yards. To fire a submarine projectile he used 200 pounds air pressure; the highest was 495 pounds, but it did not appear to make much difference in the range; 250 pounds did nearly as well. The Delamaters built the projectile. This particular pneumatic gun was made of a welded steel tube, and was the foundation for the pneumatic gun system that was afterwards developed under the management of the Pneumatic Dynamite Gun Company. This craft is now lying at New Haven, Connecticut. Her engine is still in her, but the air compressor was taken out about two years ago to run a forge.

Boat No. 3 was built at Ganning's Copper Shop, Jersey City, New Jersey, and was a working model. In her Mr. Holland first employed the apparatus for steering under water in the horizontal plane; he intended to build a gunpowder engine to propel her under water, but, before he accomplished this, she was sunk opposite Whitestone, the engineers, not understanding how to fasten the turret, having left it open about half an inch. A few experiments under water were made before the accident. She was 16 feet 4 inches in length by 28 inches diameter, and of one ton displacement.

Model No. 4 was known as the Zalinski boat, and was built at Fort Lafayette, of composite iron frame, planked with wood; she was 40 feet long, 8 feet diameter, and it was the intention to arm her with large Zalinski pneumatic guns. The launch was mismanaged, the ways broke under her, she fell on the rocks and was seriously damaged. She was repaired sufficiently to carry on experiments at the dock, where she was frequently submerged, and much information secured concerning the control of water ballast. She was finally broken up.

In all these boats Mr. Holland's fundamental principle was to dive, and not to control them, as in the foreign types, either by the inlet, or outlet, of water, or by the down-haul screws alone.

The main things proved by these experiments were: that in submarine boats it was essential to have an unmovable center of gravity; that the movable center was the cause of nearly all the failures; that during the submarine run the weight must remain absolutely unchanged, being kept the same automatically, otherwise she cannot dive when you desire it, or she may run to too great a depth.

Another thing demonstrated was the value of a boat that would be as small as possible, consistent with having sufficient offensive power. It must also be quick-acting, so as to be able to come to the surface and to disappear as rapidly as a porpoise. A cardinal principle governing its design is simplicity.

While there have always been naval officers in the United States who have advocated the value of submarine boats, and the Navy Department has at various periods interested itself in them, the advertisements of November 26th, 1887, and May 1st, 1893, called forth the most important proposals, and a contract was entered into with the Holland Company in 1895.

The one constructed by the Holland Company for the United States Navy Department was named the "Plunger" by the Department, and was launched August 7th of last year at the constructor's yard in Baltimore. She is the fifth one designed by Mr. Holland, and is 84 feet long, of circular section, 11½ feet in diameter, surface displacement 165 tons, with a reserve buoyancy of about a quarter of a ton. The guaranteed speed is fifteen knots on the surface and fourteen knots while awash, with 1 foot of the turret above the water. Her totally submerged electrically running speed must be eight knots for six hours.

There is a turret amidship with 4-inch protection and a superstruction for a fair water. Two down-haul screws have been added, although they are not considered by Mr. Holland a requisite of the system. There are two openings in the nose-piece through which service torpedoes are to be discharged.

In addition to hand-gear for horizontal steering and diving, there are automatic devices for maintaining submergence at predetermined depths. A camera lucida has also been fitted.

The hull has been constructed to admit a submergence of 75 feet. Some of the water-tight compartments serve as water tanks; others contain oil fuel; others are employed for compensating discharged weights. A special device compensates for the oil consumed. There are four rudders, two for steering horizontally and two vertically, controlled by automatic devices.

For running on the surface or awash, steam generated by petroleum is employed, while electricity from storage batteries is used under water. There is one water-tube boiler of the Mosher type of 3000 square feet heating surface, fitted with a system of oil fuel capable of consuming 2000 pounds of oil per hour. There are two main, vertical, triple-expansion steam engines of 600 H. P. each, and one auxiliary of the same type of 300 H. P.

The electric machinery is composed of one main motor of 70 H. P. for propelling the boat when submerged, operating either the side or center shaft, or used as a dynamo for recharging batteries. There are additional electric motors for operating down-haul screws and performing other services as required.

Air for tank and ventilation service is supplied from commercial reservoirs. There are special fittings for closing smoke pipe and air ducts quickly before submerging, and the tank operations are very simply controlled by Kingston and compressed air reducing valves.

The "Plunger" has three propellers (in addition to the down-haul screws), any one or all of which can be operated by either steam or electrical machinery.

Owing to the delays incident to the many modifications of the "Plunger," constructed for the Navy Department at the Baltimore shipyard, the Holland Torpedo Boat Company decided to build a boat into which the essential elements of Mr. Holland's type could be introduced and experimented with by the company, and boat No. 6, the "Holland," was built at the Crescent shipyard, Elizabethport, New Jersey, by Lewis Nixon. Its form resembles that of the porpoise and its dimensions are: Length, 50 feet; diameter, 11 feet; displacement, light, 119 tons; displacement with superstructure awash, 138 tons; displacement, submerged, 139 tons; reserve buoyancy, 0.7 tons.

In this boat no attempt was made to secure a higher speed than was necessary to secure proper diving and steering properties. It was fitted with a 50 H. P. gasoline engine for surface runs, air compression, and storage battery charging, and a 50 H. P. electric motor for submerged work.

Its armament consists of one 18-inch service torpedo tube and two dynamite guns fitted for powder and compressed air discharge.

At a speed of eight knots the "Holland" maneuvers, steers and dives beautifully, and the control of submergence is speedily and easily effected by the operation of Kingston and compressed air reducing valves. Her stability has been thoroughly proved, and the atmospheric conditions when submerged are infinitely safer and more comfortable than those of the ordinary torpedo boat.

From four to six men are required for her operation.

The boats can be readily fitted with Whitehead or Howell torpedoes, employing powder or compressed air discharge, or with over-water projectiles fired with either powder or air or a combination of both.

If these vessels are to be supplied in large numbers; if they are to be quickly built and to become speedily available for the crises which arrive to every nation, their advantages can be the more readily understood when it is known that the elements of which they are composed and built are commercial products. Gas and steam engines can be secured from a hundred builders; electric motors have replaced and are as easily procurable as horses; electric storage batteries, though still far from being fully satisfactory, are no longer novel and difficult to obtain; compressed air cylinders are increasing every day in strength and capacity; petroleum fuel can be carried with less danger than bituminous coal; and the parts which compose the special controlling mechanisms of the system are all marketable products, easily and quickly assembled and adjusted.

In conclusion, Capt. Jaques emphasizes the fact that submarine navigation, which has so long been attempted by many nations, is at last an accomplished fact, and that we are not speaking simply from theory, but from actual practice and serious experience in a useful submarine boat.

In the design and construction and practice with the Holland submarine boats "Plunger" and "Holland," we have been going on the principle of developing not a boat simply as a toy or a working model, but one which will be especially useful for the primary purpose to which a submarine boat should be put—that is, of actually fighting vessels around the harbors and on the coast, instead of in the open sea.

The dimensions of a submarine boat proper should be governed by the necessary offensive power, and, while having in it all the destructive power desired, it should be small enough to get close up to and, practically, nibble at the bottom of the ship to be destroyed.

This object appears to have been accomplished in the "Holland," for she has all the speed necessary to control her fish-like qualities, has power to disappear, can take care of herself, and, at the same time, is able to work three very powerful guns.

While this has been accomplished, no doubt other valuable developments will be in the direction of small craft to take the place of second-class torpedo boats and battleships, and of semi-submerged boats of almost any dimensions, having armor enough above water to afford ample protection, at the same time protecting all the rest by water.

We all know how difficult it is to adequately protect a ship with armor even by a most careful distribution of weights. The semi-submerged boat presents a type in which one can armor such parts as are necessary, employing very heavy armor, having reduced to a minimum the part exposed, and possessing submarine qualities, it is the only kind of boat that will do this, as it is well known there is not a torpedo boat in existence to-day that will meet these conditions.

In such a craft one can get close up to a ship and fire the torpedo into her, while an ordinary torpedo boat will be simply riddled and sawed into pieces by rapid-fire ammunition. Further, a semi-submerged, armored torpedo boat will be able to get so near her target, that by greatly reducing the range she will eliminate many of the disadvantages of the present long ranges required for the Whitehead torpedo. Again, a well-disciplined crew is given a chance to do something, for their quarters will be infinitely more comfortable than those they at present occupy in the torpedo boat; they will have a feeling of safety which they do not now enjoy, and they will know that they will land their torpedo close enough to blow up the ship. Such a craft may be compared with a large automobile torpedo, one of sufficient size to carry a crew, and yet possessing not only similar automatic devices for controlling its position, but having them supplemented by direct mechanical contrivances under the direct control of the brain of man.

Such a boat will be practically irresistible and invulnerable; will even resist the attack of heavy ordnance, and is a type that it will be impossible for a battleship to avoid.

While giving importance to the designs that will utilize the semi-submerged principles, the great need of the hour for harbor and coast defense is a small torpedo boat that can be submerged, having within it a storage battery of sufficient power to

give it a submerged range of a few hours, with nine or ten knots surface speed and from six to eight knots submerged. Such craft can be quickly and cheaply constructed and very much more efficiently controlled and protected than the very rapid torpedo boats or torpedo-boat destroyers which represent the magnificent mechanical development of the present age.

Conditions of a Good Result from Amalgamation.

Under the above head the *Canadian Mining Review* gives a collection of practical pointers thereon, which seem in their arrangement only to be orignial with that journal. They are as follows:

1. Very fine stamping if the gold is very fine.
2. A coating of gold amalgam on the copper plates. No amalgam should be removed until a hard layer of it has been formed on the plates.
3. The use of a proper quantity of water; too much will result in a coarse crushing, a less complete mechanical exposure of the fine gold, less contact of the gold and quicksilver, and a premature sweeping off of both. The addition of too much quicksilver, though causing the formation of more amalgam, will only lead to its being swept away by the current.
4. Proper temperature of the battery water. The water ought neither to be too cold nor too hot; 90° to 100° Fahr. is the best, if by artificial means it can be raised to it.
5. The addition of quicksilver in proper quantity. This condition should be closely studied in each mill. There is always a considerable loss of quicksilver. The quicksilver when introduced in the battery is finely divided by the stamps, and thus affords an opportunity for the amalgamation of the fine particles of gold. By the violent motion of the water in the battery, produced by the fall of the stamps, particles of gold amalgam and quicksilver are carried with the pulp to the copper plates, to which they adhere.
6. Proper height of the charge in the mortar. This should not be allowed to rise higher than about 3 inches below the lower edge of the inner plates. If the quartz and pulp in the battery come nearer the plates, too much stuff, which is also too coarse, is thrown upon them, thus either preventing the accumulation of amalgam or displacing it after collection.
7. Regular feeding.
8. Care in keeping the plates clean.
9. Care in the mill against the introduction of grease or greasy substances, and against the use of exhaust steam for heating water required in any of the amalgamating processes. In lubricating the cam shaft, journals, cams, tippets, or any other portions around the batteries, care must be taken not to drop any lubricant into the mortar.
10. Rejection of hydrated oxidized iron ores, silicate of magnesia and alumina ores; they cause a frothing of the water, and coat the gold with a slime which resists amalgamation.
11. Avoidance of mineral waters for battery amalgamation, especially if they contain sulphur in the shape of sulphureted hydrogen, as a coating will be formed on the gold particles which prevents amalgamation.
12. Care that the amalgam on the copper plates is not allowed to get too hard, as it may fail to catch the gold. If, therefore, the amalgam should get too hard, it will be well to sprinkle through chamois cloth some globules of quicksilver over the amalgam. If, however, it becomes too soft again, there is danger of "flouring" and losing it, with some of the gold.
13. A dilute solution of cyanide of potassium should be always kept on hand, and when yellow spots appear on the plate some of the solution should be poured over it. If this does not remove a spot, hold a lump of the cyanide over it, or rub it, which will have the desired effect.
14. If the ores contain soluble sulphates, arising from the decomposition of iron or copper pyrites, the addition of lime will prove beneficial while passing through the battery.
15. When treating gold ores containing manganese it is necessary to clean the plates of its adhering amalgam at least once a week and give them a fresh coating of quicksilver.
16. It will be found that in many cases amalgamation can be promoted by discharging from the battery onto concentrators direct, which will collect all the heavy mineral particles which interfere in the ordinary amalgamating process, and submitting the concentrates to separate treatment. The overflow of tailings which pass the concentrators, if carried over copper plates, will give up the gold easily now, in case any fine particles have escaped the concentrating process, as the ore has undergone a cleaning process in the separation of the sulphuretted ores, which naturally interferes with copper-plate amalgamation. If the concentrations are submitted to treatment in grinding pans, the tailings from the settler ought to be run over slime tables to collect any escaping minerals of value.
17. When treating heavy pyritic ores, it will be found advantageous to have an iron pipe with little holes, discharging from the outside copper plates a fine, gentle shower of water, so as to assist the carrying off of the heavy sulphurets, which would cover the plates over and prevent the free gold coming in with them.

Discussion on "Treatment of Slimes."

Chas. Butters' recent paper on the treatment of slimes, which is the latest valuable contribution to the literature of the cyanide process, was discussed by the Chemical and Metallurgical Society of South Africa, before which it was read, and some questions asked and answered.

A. F. Crosse.—I would like to ask if you think there is a possibility of any chemical method for precipitating gold from weak cyanide solutions displacing the present electrical method.

Prest. Butters.—That is a question I have thought over a good deal. Prof. Christy of the University of California has introduced a chemical process for the precipitation of gold from cyanide liquors, and lately in my Salt Lake City laboratory, in the United States, I have had a more or less extensive set of determinations made as to the chemical methods of precipitation, but without good results. I do not think that any chemical method of precipitation will ever take the place of electrolytic precipitation for very dilute solutions. Where you have thousands of tons of solution to precipitate, chemicals must be added in such a large way that the expense is prohibitive. For instance, when we want to bring up our solution in lime, which 6s 9d or 7s per bag of 180 pounds, from 0.005% to 0.010%, it takes a lot of lime, although lime is a fairly cheap substance. You must have something in the solution of a chemical nature, and there must be an appreciable amount of that chemical present, but when you get down to 0.001% of chemical present, it seems to lose its efficiency. Very dilute solutions of cyanide seem to have more chemical power than almost the most dilute solution of any other chemical I know. With the electrolytic process all that is required is power—you burn coal, which is only another form of energy. I do not think you will see electrolytic deposition replaced by chemical methods of any kind or description, although if anyone brings a method forward I will be one of the first to study it.

J. R. Williams.—In regard to chemical precipitation, I believe that Prof. De Wilde was the first to suggest any process for the precipitation of gold from weak cyanide solutions. There have been many workers in this field since, and they all require acid solution as a starting point. I think that the total cost of precipitation would be about ¼d per ton of solution, so that until now chemical precipitation compares unfavorably with present methods.

A. McNaughtan.—I would like to ask, Mr. President, if you have ever come to any satisfactory conclusion as to whether in slimes it is really reducing agents, or sulphides, or possibly a coating of free sulphur on the gold, which prevents the solution of the gold in the cyanide solution?

The President.—I do not know what the reason is. I dissolve the gold now, whereas formerly I did not.

R. W. Schumacher.—In regard to the precipitation of slimes, is there any chance of doing without the addition of lime? I believe that lime costs 7d per ton treated, which is a considerable amount, and if the slimes could be precipitated by some cheaper reagent it would be a great gain.

The President.—I would be glad to give £10,000 to anyone who will find a reagent for precipitation that is cheaper than lime. It is a very important point and would repay any amount of study. As I have before stated, I do not know whether the coagulation of the slime in solution is a chemical action or not.

J. Loevy.—It is generally considered a physical action.

The President.—A certain amount of reagent is necessary in the water, and when you use from eight to ten tons of water per ton of ore crushed, you have to bring eight to ten tons up to a certain percentage with some chemical. If the water used in the process was kept in constant circulation, doubtless it would save a little of the lime.

A. Prister.—I quite agree with the chairman's statement that lime cannot be readily replaced by another substance for the precipitation of slimes. After some study of the literature of the subject I found that Rittinger, who has particularly investigated the velocity of falling bodies of different specific gravity in water, gives the following empirical formula in *Aufbereitungskunde* of 1867:

$$V = 2.77\,[D\,(d-1)]^{\frac{1}{2}}$$

In this case

V = velocity in meters per second.
d = specific gravity.
D = diameter in millimeters.

This formula indicates two ways for accelerating the settlement of the slimes:

(1) By increasing the diameter of the mineral particles.

(2) By increasing their specific gravity.

If the average diameter of slimes particles be increased without addition of any other substance, we obtain sands, not slimes.

Though any increase of the specific gravity of the slimes is impossible, yet we derive unexpected assistance from the discovery that the addition of lime accelerates their settlement. At first sight this appears to contradict the foregoing statements, but closer examination of the problem will, I think, confirm my explanation of it. Mr. Crosse's determination of the specific gravity of one sample of slimes was 2.62. The specific gravity of the following bodies is:

Calcite	2.5 — 2.8
Magnesite	3.0 — 3.2
Dolomite	2.8 — 2.9
Calcium oxide	2.3
Calcium hydroxide	3.2
Magnesium oxide	3.55
Magnesium hydroxide	2.37
Lime (industrial)	3.03
Clay	1.8 — 2.6
Silica	2.6

According to Mr. Bettel (Eissler's "Cyanide Process") slimes are composed of mineral particles of less diameter than 0.01mm. The settlement of slimes is very slow on account of their small diameter and low specific gravity. By adding lime their settlement is accelerated in consequence of a simple mechanical action. It will be noted that the specific gravities of dolomite, calcium hydroxide and magnesium oxide, all constituents of our local lime, are higher than that of slimes. Hence one of the conditions required by Rittinger's formula for accelerating slimes settlement is obtained, *i. e.*, increase of the specific gravity. I think that an experiment made by Mr. Bettel at his slime plant on the East Rand mines corroborates what I say. He stated, in an issue of the *S. A. Mining Journal* during January, that the settlement of the slimes was slower in consequence of the low alkalinity of the lime employed. You are aware that the lime used on the Rand contains more than 11% of silica, and as this has the same specific gravity (2.6) as the slimes themselves, it cannot accelerate their settlement on this account, but only by carrying downwards the slimes particles. The diameter of ground lime particles is undoubtedly greater than that of the slime particles, so that this fulfills the second condition necessitated by Rittinger's formula for the acceleration of the settlement. As the magnesium oxide and calcium hydroxide particles form a flocculent precipitate, they involve the slimes particles and carry them down. Lime is here the cheapest material, having higher specific gravity and greater diameter of the particles, which is available for slimes settlement. The fact that the velocity with which a body falls in a liquid depends upon the density of that liquid explains why such a large quantity of water is required.

In conclusion, Mr. Chairman, I am of your opinion that lime will not soon be replaced by another reagent for the settlement of slimes.

SOME of the more interesting additions recently received for the museum of the California State Mining Bureau are: Cinnabar and livingstonite from the Huitzuco mine, Iguala, State of Guerrero, Mexico, G. W. Moebus; plattnerite dioxide of lead: large and fine specimen of this exceedingly rare mineral from the You Like mine, Mullan, Idaho, W. J. Clark; loadstone (natural magnet) from near Coloma, El Dorado county, Cal., F. C. Leavitt; large specimen copper ore, United Verde mine, Arizona, W. A. Clark; old pick encrusted with gravel—a relic of 1848 recently uncovered by John Jacobson in cleaning out the old tail-race of Sutter's mill near Coloma, El Dorado county, Cal.—the scene of the discovery of gold by Marshall and Wimmer fifty years ago, presented by F. C. Leavitt; zeolite in basalt, Yuma county, Arizona, and very rich specimen of partzite with native silver and copper, F. C. Mathyas; a very interesting set of specimens containing fossils from the Diadem gold mine, Meadow Valley, Plumas county, and auriferous dolomite, J. A. Edman; temantite: fine crystallized specimens from the Freeland lode, Idaho Springs, Colorado, a rare mineral, W. S. Keyes; rich copper ore with native silver from the Anaconda mine, Butte, Montana, W. S. Keyes; and some others of less importance.

H. S. DURDEN, Curator.

Dredging Plant for Boise River.

D. P. Cameron, representing the Risdon Iron Company of San Francisco, has arrived to take charge of the work of erection of the dredge for the New England Dredge Company at Idaho City. He expects the machinery to begin to arrive Thursday and is advertising for teams to haul it to Idaho City. Mr. Cameron has just returned from Breckenridge, Colo., where he has put up two dredges of a capacity of 2500 yards per day each. He arrived there February 14th and had to work in deep snow. He expects to have the dredge here in operation by the 4th of June. The plant is to be erected at Warm Springs, two miles this side of Idaho City.—Boise, Idaho, Statesman.

AT a recent meeting in London of shareholders in the Golden Horseshoe Gold Mining Company, Western Australia, the chairman is reported to have made the following extraordinary assertion as to the value of the lode: "You will remember, and you must bear in mind, that every foot of the lode is estimated to be worth to us something like £20,000." What a man he would be to write letters to a daily from Dawson City!

Misrepresentations Condemned.

TO THE EDITOR:—I wish to express my views through the medium of the MINING AND SCIENTIFIC PRESS of the gross misrepresentations constantly being made by the local newspapers in the different mining districts of the Pacific coast—more especially in those districts of California lying north and south of that portion known as the Mother Lode. For instance, only last week a weekly paper published in the northern part of the State contained an account of an abandoned mine, when the ore vein was represented to be 110 feet wide and to have yielded in the past some $3,000,000 and that the ore body was still intact. Now, the true facts of the case are, to the writer's personal knowledge, that the width of this ore vein was nowhere in any stage of its development 10 feet wide, much less 110, and to be exact the vein varies from 6 inches to 3 feet in width, and is developed to a depth of about 700 feet. The actual output is not known, but is believed to be about $750,000.

In the same issue appeared a description of a mine located in the northwestern part of the State, and on which only superficial developments have been made, that was represented as being on the same vein as the famous Kennedy mine in Amador county, and of equal value also; that the richest portion of the Mother Lode was that part lying in Siskiyou and Del Norte counties; that all the mines are in the same formation that characterize the Mother Lode; and that the dike system was identical with that found in Amador and Calaveras counties. This is untrue in every detail, and such misrepresentations have a tendency to greatly injure a mining section and retard its development. It is a well-known and established fact among mining engineers and scientific men generally who are familiar with such matters that what is known as the great Mother Lode of California does not extend into Siskiyou and Del Norte counties, and the mineral zone of northwestern California and southwestern Oregon have not the same characteristics and bear no relation whatever to the great normal fissures known as the Mother Lode, which is unquestionably the greatest system of auriferous quartz veins that has thus far been discovered. There is, nevertheless, a vast field for investment in the mineral zones lying off the Mother Lode, but this should be done on legitimate lines; and I believe it to be the duty of such publications as the MINING AND SCIENTIFIC PRESS to correct the erroneous impressions made by some of our local newspapers on our unsophisticated neighbors in the East and elsewhere.

E. S. ADAMS, M. E.

Yreka, Cal., April 23rd, '98.

Recent California Mining Incorporations.

Gold Slide Placer M. Co., Auburn; capital stock $6000, subscribed $25; G. F. Huber, L. L. Chamberlain, M. Hohman, B. B. Deming.

Kotzebue Sound T., M. & T. Co., San Francisco; capital stock $100,000, all subscribed; P. H. Cook, H. M. Hough, A. H. Herriman, J. A. Ralston, C. W. Tozer, F. L. Noonan, L. E. Noonan.

Agnes G. M. Co., San Francisco; capital stock $150,000, subscribed $100,000; W. H. Storms, A. P. Johnson, H. Braunton, C. Cleve, G. Lezinsky.

Omo M. Co., Sacramento; capital stock $100,000, subscribed $41,000; W. D. Lawton, J. H. Wright, W. T. Mendenhall, H. W. Lawton, G. G. Armstrong.

North Star Con. G. Mines, San Francisco; capital stock $250,000, subscribed $200,020; P. L. Shuman, S. J. Hendy, T. B. O'Brien, E. B. Rogers, T. L. Ford.

Reed D. and M. Co., San Francisco; capital stock, $750,000; subscribed, $375,000; W. H. Martin, J. M. Bigger, J. W. Hamilton, R. R. Smith, F. H. Gould.

Balboa G. M. Co., San Francisco; capital stock, $500,000; subscribed, $50; R. E. Williams, D. McMillan, T. A. Vest, J. H. Houston, A. Phelps.

Recently Declared Mining Dividends.

Argonaut, California, 10 cents per share, $20,000; payable immediately.

Big Seven, Montana, $36,000; April 30.

Swansea, Utah, 5 cents per share, $5000; payable May 10.

Silver King, Utah, $37,500; payable May 10.

Coast Industrial Notes.

—The price of Oregon saw logs is $5 per M.; $3.50 a year ago.

—Southern California's citrus fruit crop for '98 is estimated at 4,436,000 boxes, which will net the growers nearly $4,000,000.

—A letter from Geronimo, Arizona, states that the railroad to Globe has been graded fourteen miles and the track has been laid eight miles. The work is progressing.

—The Mare Island, Cal., government construction and repair departments paid for labor during the first half of April $63,000, and during the three months ending March 31st $332,000.

—Last year the Puget sound salmon pack amounted to 434,000 cases, valued at $1,850,000. If the run of fish is as large this year as expected, it is intended to double last season's pack.

—Russian journals state that the coal discovered last autumn by a Russian expedition on the shore of Ochotsk sea is, as regards quality, better than any other coal known in Russian territory.

—The Los Angeles, Cal., *Express* says the drouth is so intense on the desert that hundreds of thousands of acres of grease wood is dying. Almost all vegetation between Mohave and Death Valley will be swept away.

—The Santa Fe Railroad Co. is contemplating closing the gap between Mohave and Bakersfield, Cal., and forming a connection with the San Joaquin Valley road. The route of the extension would probably be from Johannesburg through Walker pass and down the canyon of Kern river to Bakersfield.

—Water is being pumped from the Sacramento river and used to irrigate the farms along its banks. The barge Merritt has been fitted out with pumps and engines. At Sacramento a river boat will take hold of the barge and tow her to the neighboring ranches. The pumps on the Merritt can raise 20,000 gallons a minute.

—The daily output of the Santa Cruz, Cal., powder mill is now 5000 pounds of smokeless and 12,000 pounds of brown powder daily. The only delay caused by the recent explosion will be in the manufacture of infantry smokeless; but there is enough of this now on hand to supply 60,000 men for three months. The powder used by the American ships at Manila was made there.

—A circular has been sent out advising the owners of over 200 shingle mills in western Washington to shut them down at once, arguing that war is seriously affecting the business; that shingles have weakened and buyers stopped until they can see how they are affected. Shingle prices have declined somewhat and Eastern orders are decreasing, though this should be the busiest season of the year.

—Consul Smith writes from Moscow: "It is decided by the authorities to have an express service between St. Petersburg and the farthest extremity of the Siberian Railway which is finished. A train will be dispatched twice a month and will make the entire run in six days. The train will consist of one dining car, with library, passenger and sleeping coaches, and will have all modern conveniences. The service will commence in the month of May."

—The sealing season on the coast closed last Saturday, and the schooners, thirty-four in number, are returning home to outfit for the Behring sea season, which opens on Aug. 1st. The coast catch has been good, the estimate from reports received from the points on the coast which the schooners have touched being 7000 skins—2000 in excess of the coast catch last year. The best catches were made off the coast of California, where the schooners had fine weather and found an abundance of seals.

—Raisins, oranges and lemons are the principal fruits the United States imports from Spain, figs and currants to a smaller extent. A lessening of purchases of these fruit products should be of material benefit to California. Raisins grown in California have already checked the imports of Spanish raisins. The exclusion of these Spanish products for six or twelve months would secure a stronger foothold all over the nation for California fruits, extending their consumption and rendering it still more difficult for the foreign fruits to regain their former position.

—Northwestern papers think the Spanish war may be the means of developing the coal industry of western Washington to a most unexpected degree, because of England making coal a contraband of war. Heretofore the coal dealers who supply merchant vessels with fuel have been obtaining their coal from British Columbia mines. But during the existence of hostilities not a citizen either of the United States or Spain can buy a bushel of coal of an English subject. A big fleet of coal vessels is on the way to San Francisco from Australia and English ports. Coal is a contraband of war and merchants have been preparing for the coming struggle between this country and Spain. No more coal can come from British Columbia, the principal source of San Francisco's supply, and to guard against a shortage the Government has made arrangements for the transportation of 80,000 tons by rail from Pennsylvania.

—"It is a great country, but you cannot do business rapidly there," says J. A. Fairchild, speaking about a recent trip to Mexico. "My journey was made at the solicitation of Mr. Robinson of the Mexican Central Railway. One of my purposes was to look at the large deposits of asphalt found near Tampico. I found them very large, but the quality is somewhat doubtful. We are having tests made which will determine this point. I also went to consider some contracting plans. But you cannot do anything in a hurry there. My visit was preliminary and will be followed by others. The methods in use in letting contracts is in sharp distinction as compared with ours. The Board will meet and look all over all bids and then gradually sift the bids down till they get the one that the entire Board thinks is the best one—that is, the one from which the best work can be expected. The prices have only a secondary consideration. For example, there is now being built in the City of Mexico the finest sewer system on the continent. A French company is doing the work, superintended by Mr. Guyot, the noted engineer. The bid of this company was $2,000,000 more than the next lowest one, yet it was awarded the contract because it showed conclusively that it could do better and more perfect work in all details than any of the competitors."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 26, 1898.

603,003.—DUST PAN—Laura M. Black, San Antonio, Cal.

603,101.—ROCK DRILL CHUCK—E. H. Bourne, Downieville, Cal.

603,175.—SPRING-FORMING MACHINE—C. Collins, Los Angeles, Cal.

603,176.—CAR COUPLING—H. M. Cox, Linden, Cal.

603,178.—WRENCH—M. H. Curry, North Pomona, Cal.

603,133.—SEPARATOR—W. J. Dwyer, Hillyard, Wash.

603,181.—FURNACE—Farrell & Douglas, Morenci, A. T.

603,184.—PIANO PLAYER—F. H. Goolman, Los Angeles, Cal.

603,104.—GAS METER—J. Herbert, Oakland, Cal.

603,084.—TONGS—V. G. Higgins, Waddington, Cal.

603,144.—HOSE NOZZLE—Kellerman & Crane, Montesano, Wash.

603,110.—BOTTLE—J. B. Marshall, Fresno, Cal.

603,020.—FRUIT STEMMER—G. Pettit, Fresno, Cal.

603,211.—SURFBOAT—L. W. Stevens, Los Angeles, Cal.

603,119.—WINDWHEEL—E. H. Thompson, Newark, Cal.

603,159.—WRENCH—E. M. Tyler, Auburn, Cal.

603,215.—ROPE RAILWAY—C. L. Van Buskirk, Lodi, Cal.

602,988.—LAND ROLLER—W. Wildman, Spadra, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROCK DRILL CHUCK.—Edwin H. Bourne, Downieville, Cal. No. 603,101. Dated April 26, 1898. This invention relates to a chuck or holder for rock drills and is especially designed to automatically lock the drill in place by the simple act of introducing it into the chuck and starting it to work, and it also provides an easy means for releasing it when it is to be removed. It is difficult to fix the shanks to rock drills in the end of the movable driving head or piston so that they will remain tight, and it is still more difficult to remove them when it is necessary. This invention consists of a segment in one side of the socket having an inclined or tapered inner wall and a straight outer wall to fit closely for its entire length in the corresponding wall of the socket. A second segment in the opposite side of the socket has an inclined or tapered inner wall and a straight outer wall, the inner ends of both segments abutting against an internal shoulder in the drill socket. A pin is driven transversely through the upper end of the first-named segment and permanently secures it in place, and a single wedge-shaped key is placed centrally behind the other segment so as to be moved to a point where the segments will stand with such relation to each other that the head of the drill shank, being tapered to correspond with the interior bore of the segments, will lock itself by the impact of the blow when it commences to work. The wedge-shaped key is so constructed that by driving it back or loosening it slightly the segments will be separated and the drill will fall out without difficulty.

COIN-CONTROLLED METER.—J. Herbert, Oakland, Cal. No. 603,104. Dated April 26, 1898. This invention relates to a coin-controlled apparatus which is especially designed for the measurement of gas, water, or other substances which can be so measured, and may also be applied to the measurement of electrical currents by the same mechanical operations. It comprises a coin chute, an adjustable stop in the line of the chute by which the coin is arrested, a gate movable transversely with relation to the coin chute and having a hole made through it, a rod or stem standing in line with the hole so that it operates upon the gate only when the coin is in position between the rod and the gate. An arm is connected and movable with the gate and a vertical screw-threaded shaft is provided with a loosely slidable weight movable upon it, a lever arm carrying a screw-threaded segmental nut is adapted to engage the screw-threaded shaft and retain the weight in position, and as the screw turns the nut will be moved and caused to travel from one end to the other. This is effected by a contact portion of the lever against which the gate-actuated arm presses when the gate is moved so that the segmental nut is disengaged from the screw and the weight allowed to drop. As soon as the gas commences to flow it acts through the usual meter mechanism to turn the screw, and this moves the nut with which the weight is connected until it arrives at the point where it shuts off the supply of gas or other medium until another coin has been introduced, when the operation may be repeated.

Personal.

J. E. SUMMERS is appointed Supt. Scanivino mine, Sonora, Cal.

M. EDIAMS becomes Supt. Bryan & Sewall mine, Republic, Wash.

R. WALKER, a mine owner of Grass Valley, Cal., is in San Francisco.

N. CARMICHAEL becomes Supt. Keystone mine, Amador City, Cal.

LEO VON ROSENBERG, a New York mining engineer, is in San Francisco.

W. H. MCCLINTOCK, Supt. Goodwin mine, Sonora, Cal., is in San Francisco.

PROF. N. S. KEITH has made headquarters at 62 Nevada Block, San Francisco.

S. W. CHENEY, Supt. Jamieson mine, Johnsville, Cal., has returned to San Francisco.

T. CLARK, owner Franklin mine, Placerville, Cal., has returned home from San Francisco.

HON. CURTIS H. LINDLEY has returned to San Francisco from a professional visit to Washington, D. C.

H. W. FAIRBANKS has returned to Berkeley from a reconnoissance of the southern California oil fields.

CHARLES BUTTERS is daily expected in Salt Lake City, Utah, en route to San Francisco from South Africa.

W. J. SHARWOOD of the University of Cal. has taken a position as chemist to the Montana M. Co.'s cyanide plant, Marysville, Montana.

GARDNER WILLIAMS, one of California's eminent mining engineers, for some time in charge of South African properties, is expected in San Francisco next week.

THOS. KEARNS, Mgr. Silver King mine, Utah, is in San Francisco. He, with Messrs. Keith and Newell, have been negotiating for the purchase of the Isabella mine, Tuolumne Co., Cal.

WILLARD L. MORSE, for the past two years general manager of the Huantla Santa Ana Mining Co., Huantla Morelos, Mexico, has been appointed assistant general manager of the various smelting and mining companies owned by Messrs. M. Guggenheim's Sons in Mexico.

Commercial Paragraphs.

DEARBORN DRUG & CHEMICAL WORKS, 2327 La Salle St., Chicago, Ill., will send to any address their two recent booklets, of value to all steam users and consumers.

IT is again asserted in New York City that a consolidation of the diversified interests in the electrical field is under contemplation and that the combination would take in the General Electric, Westinghouse and Walker Companies with a combined capital of $100,000,000.

THE E. P. Allis Company, of Milwaukee, has a contract for the engines and boilers for the Deadwood and Delaware Smelting Company, of Deadwood, S. D., to be placed in a new smelting establishment. They have this week placed a new furnace at Daggett, Cal., for the Pacific Coast Borax Company.

TWO MINING EXPERTS from Japan, after examining the large compound condensing pumps in the Free Silver mine at Aspen, Colo., built by the Jeanesville Iron Works Co., Jeanesville, Pa., and bought by D. W. Brunton, placed an order with the Jeanesville Co. for two compound condensing mine pumps, 1000 gallons per minute capacity, for Japan.

THE San Juan Gold Mining Co. of Telluride, Colorado, has placed an order with the Colorado Iron Works Co. for a 100-ton dry crushing plant. Their patent high-speed, narrow-face rolls will be used to do the fine crushing. The sizes of these rolls are 54x8 inches, 42x6 inches and 30x6 inches. Bruckner cylinders, roasters, screens, ore breakers, elevators, etc., constitute the balance of the machinery for this plant.

THE Grace Dollar, a steamer built by the Fulton Engineering and Shipbuilding Works, will be launched within a few days at Harbor View. The boat is 175 feet long and was built for Robert Dollar, who has chartered it for one year to the Johnson-Locke Co. to ply between San Francisco and Kotzebue Sound. The Fulton Works are also constructing two freight steamers, each 160 feet long, which will be launched next week.

THE Pelton Water Wheel Co. have under construction a power plant for the British Columbia Railway Co.—the most notable installation of the kind in the Northwest. The power station is located at Gold Stream, some twelve miles from Victoria, and the water supply is furnished from the Esquimalt water works system. The plant consists of two 38-inch D. N. Pelton wheels, 600 H. P. each, running at 600 revs. under 590 feet head. The wheels are direct-connected to Canadian General Electric generators by insulated couplings. The power thus generated is to be transmitted to Victoria at a pressure of 10,000 volts and then used for running the railway system of that city, lighting and general power purposes.

THE Weber Gas & Gasoline Engine Co. of Kansas City, Missouri, report the following sales of gasoline hoisting engines last week: One 10 H. P. single-drum, geared Weber gasoline hoisting engine to the Cornucopia mines of Oregon; one 25 H. P. double-drum, geared Weber gasoline hoisting engine, to be used underground, hoisting from slope, to the La Aurifera mine, Monterey, Mexico; one 10 H. P. single-drum, geared Weber gasoline hoisting engine, to the Copper Queen Mining Co., Globe, Ariz.; one 10 H. P. single-drum, geared Weber gasoline hoisting engine, to Boise City, Idaho; one 10 H. P. single-drum, geared Weber gasoline hoisting engine, to Denver, Colo.; making five shipments of Weber hoisters to mining concerns in one week.

American Goods in Europe.

Archer Brown, a wide-awake American manufacturer, who has been studying the European industrial situation at short range, writes:

It is in finished forms that the business looks most encouraging. An American machine has come to be regarded in foreign countries something as an American dentist. It is known to be superior to the home make. The Germans especially have been quick to appreciate this fact, and in the past few years have taken enormous quantities of our iron and wood-working machinery, agricultural implements, bicycles, sewing machines, pianos, organs, etc. Last year one firm in Berlin imported $2,000,000 worth of American machinery, and right here may be an element of danger to American industries. The Germans are very progressive, and are quick to see the advantage of the newest and best methods of manufacturing, and have a far-sighted industrial policy. They propose not only to take care of all their own markets, but to take the lead in the world's commerce. The American machinery that is now going there is helping to equip their factories for a struggle with Great Britain; but when they are once equipped and the present activity in their own iron works has lessened somewhat, they will equip the machinery and no longer have use for the American article. This is already being done to a large extent. An intelligent manufacturer in Freiberg, South Germany, told me they were making American machines all over Germany, and very soon would have no more need of us. They copy our agricultural implements, machine tools, stoves, etc., exactly and produce a superior article. They do not go quite as far as the Japanese, who even copy the name plates and other accidental marks, but they stick close to the American patterns.

It must be said, however, that the English and Germans manage some things better than we do. When a good business is current, they manage to protect the shareholders in their enterprises and secure some profit on it. In fact, the first thought in each enterprise is the dividends. An illustration of this occurred in London the day I left. The Metropolitan Gas Company at its annual meeting the day previous announced that its earnings were insured to maintain the usual dividends to the shareholders, and therefore the price of gas would be raised. There was naturally a howl from the consumers, but the shareholders had to be protected, even though it was claimed that poor management was the cause of the decreased earnings. Railway rates are maintained rigidly three or four times above those we are accustomed to in our country; but, as the directors of the railways point out, they kept their roads out of the hands of receivers. Manufacturers may complain that they are prevented from competing with other nations, but the railway shareholders get their dividends.

The Germans accomplish the result at least in the iron and steel trades, by a wonderful system of syndicating. Their furnaces, steel works, rolling mills and coal mines in Germany are syndicated and the prices maintained at a level high enough above cost to insure good profits. If it is necessary to meet foreign competition in any line the works which happen to be situated on the frontier are instructed to drop prices at whatever point necessary to drive off the intruder.

There seems to be no abatement in London of the fashion of recognizing or "bringing out," as they call it, industrial enterprises. Every London paper prints daily from one to half a dozen prospectuses. The companies that are exploited are located in every part of the world, but the United States cuts a much smaller figure than formerly. We have unloaded onto the British so much industrial rubbish with disastrous results to the investors that there is very naturally a deep-seated prejudice against anything from this side. Their experience with our railroads has been equally unfortunate. The English seem to have had a wonderful faculty in the past of getting into whatever there was on this side of the water that was peculiarly hazardous. They have been caught by prospectuses, promising enormous profits, and the reaction which followed has even injured legitimate American investment. It is astonishing how many careful London investors hastened to put money in the Middlesbrough, Ky., speculation of five years ago. It is said that something like $15,000,000 of good English money was sunk there.

The temper of the investor to-day is such that anything with an American label must have a good record of earnings behind it to command any attention. Our gilt-edged and low-priced securities are taken even in huge blocks. But the average promoter has but little chance there unless his venture happens to be in British Columbia, South Africa, Australia, or some other part of the world not tainted with the name of American. I am not sure but that this change will prove a wholesome thing for this country, for we are now passed the period when foreign capital is needed to promote our legitimate undertakings. Too easy access to foreign capital has, in many instances, stimulated ventures in railways, manufacturing, town buildings, etc., that ought never to have been gone into.

The English are a decade behind us in the ordinary comforts and improvements of modern life, but you had better not say that over there. There is not a modern steel office building or business structure, such as we are familiar with in Chicago, New York and many other American cities, in all Great Britain. They still build in massive stone or brick from three to six stories high, having a few steel beams for strengthening the interior of the structure. Occasionally an office building is supplied with an elevator or lift, but these are rare. An Englishman who had seen our superb modern structures in America, told me there were two reasons why they were not adopted in London and other large cities. The first was that the cities would not allow them to be built, and the second was no one would rent their offices if they were built. Their railway tracks are perhaps the finest in the world, but their railway equipment is antiquated to a great degree. The freight cars, "good vans," as they call them, have an average capacity of about seven tons; but the very largest on some lines only carry about five tons. In this country, you are aware, the average freight car now carries thirty tons.

Cast iron pipe is made in 9 foot lengths for the reason that English iron is not clear enough to run into 12-foot lengths, as is customary on this side. English engineers, therefore, whether in England or in the colonies, always specify 9-foot lengths. Our manufacturers underbid them, but bids are usually thrown out because they cannot conform to the 9-foot standard. It is not claimed that the latter has any advantage over the former, but precedent governs. A pipe maker told me that Yokohama, Japan, turned down an American bid for 6000 tons of pipe and gave it to an English manufacturer at $6 per ton higher price because they were advised by the English engineer that it would be dangerous to put in 12-foot lengths on account of earthquakes in Japan. The Japanese paid $36,000 as a tribute to a false conservatism.

Our outputs of iron and steel are so large, and our cost of manufacturing has been so greatly reduced by the compulsory education of the panic, that we are selling in nearly all lines at the lowest prices in our history. In a sense this is hard on our makers, but, perhaps, in the long pull, it is the industrial conquest of the world. The prospect for the year is for a very large business, with but little improvement in prices.

THE United States Atlantic coast line is 2349 miles long, the Gulf coast line 1556 miles and the Pacific coast line 1810 miles—a total of 5715 miles.

Sampling Ores for Assay.

F. D. SMITH.

It may seem strange to some that we should assume the position of a teacher when we tell men engaged in mining how they should and should not select samples of ore for assaying, but if the best informed and most honest assayers are to be credited, miners and prospectors must admit that they make serious and grave mistakes in selecting their samples to be sent to the assayer. Leaving out of the question the problem of taking samples for other parties, or samples which are purported to represent the mine or prospect to other parties, and considering the proper method of taking a sample for an assay which shall be of use to the miner or prospector alone, we find in these cases alone grave and serious mistakes.

Of course, if one finds a new lead or a bit of float rock, the assay here is intended to show only whether the metals sought are present or not, and but little attention will be paid to the question of "how much." But when one wants an assay to give an idea of the quantity or value of the mine or any portion of it, it certainly will not suffice for the prospector to use the usual lax methods in sampling. It costs no more to obtain an assay that tells you something definite about your prospect or mine than it does to have an assay made which tells you that the particular small chunk, weighing sometimes but an ounce or two, that you bring to the assayer has such and such values, but another piece of the same size taken near it would vary a hundred fold.

It is true that if one knows nearly the value of certain appearing rock, and should strike a new and different kind coming in, a small piece of this new mineral assayed would give the miner an idea whether he could expect that as it increased or decreased he would be richer or otherwise. But it is a very common occurrence to an assayer to hear his customer say, as he reads his report of an assay on a piece of ore the size of an egg, "that ore, then, will not pay to ship," or "that ore will pay me to mine." As if the miner could be so foolish as to think that it would do to base any extended operations involving hundreds of tons of ore upon the value of a single piece weighing an ounce. Yet the above is an actual case which happens every day.

Did you ever stop to think or do you already know why your ore varies so much in different parts of the shaft or tunnel according to the results of apparently reliable assayers, or why your returns from the sampling works are so different, and generally lower, than the results that you have received from your own assayer when you have carried to him your own selected samples?

Did you never think that perhaps you might be a little more charitable to some of the assayers that you brand as unreliable and whose results never agree with some other man's, and that you might lay a great deal of that blame upon yourself for carelessness in taking samples.

The truth of the matter is the average prospector and miner cheats himself every time he attempts to take a sample for his own individual use. He will invariably take only those parts which have considerable mineral, be it pyrite, galena or any other sulphide, or whether it carries the oxides or carbonates. He thinks why should he carry down a lot, or even any barren quartz with the mineral. What he wants is gold, silver or lead, and he knows that he cannot find it in pure quartz portions, and so he takes only the mineral portion, gets his assay returns and cheats himself out of his work and the price of an assay, but will subject himself to the disappointment of finding his smelter returns much lower than he expected.

The lesson is, take larger samples, take pieces from every part of the face of the drift, or from the whole pile that came out from a certain number of feet in sinking, and if not convenient to send so large samples, break all pieces up and mix thoroughly, and the sample out by taking out every other shovelful until the size is reduced to the required amount. Above all, in getting this large sample, do not be afraid of taking a fair proportion of the rock which does not show any mineral, for that all must be mined and shipped with the good, the tares with the wheat. Then your assay will tell you something about your mine that will be worthy of serious study; and your assayer (if he is honest) will not silently pity you for throwing your money away.

Submerged Valleys on the California Coast.

A preliminary paper of 1886 is now followed by a more detailed account of the "Submerged Valleys of the Coast of California, U. S. A., and of Lower California, Mexico," by George Davidson (Proc. Cal. Acad. Sci., 3 Ser., Geol., I., 1897, 73–103). Along our Pacific coast the continent descends to depths of 2000 to 2700 fathoms within fifty miles from the shore line. There is generally a ten-mile platform sloping out to the 100-fathom contour, after which the descent is relatively sharp. The edge of this platform is broken by twenty-seven "submerged valleys," finely illustrated in nine plates where all soundings are shown, so that one may measure the accuracy of the interpolated contours and be convinced not only that the platform is sharply notched where the submerged valleys are drawn, but also that it is essentially continuous elsewhere. The notches are sometimes in line with rivers on the land, as at Monterey and Carmel, but others appear to be entirely independent of existing drainage, as King peak and San Pablo valleys, both of which have to be named after mountains opposite their heads. The curious story is told of a vessel that was lost on the rocky coast fronting King peak. She probably had run in along the axis of the submerged valley and, finding no bottom with the ordinary line, thought she was at a safe distance off shore. The possibility that certain chasm-like valleys, such as that at Vincente, result from dislocations appears to be excluded by the evenness of the littoral platform on either side of the chasm, but the actual origin of the valleys can hardly be found until they are studied in connection with the structure, form and drainage of the neighboring and still visible land. In noticing, *Science* thinks it well to guard against the implication that submerged valleys result from "continental" movements by remembering that the earth's crust may bend beneath the sea as well as upon the land, and that the down-bending and consequent submergence of a coastal belt give no more warrant of a truly "continental" movement than does the occurrence of a local inland anticline.

"WHAT possible plan can be devised to stand off the mosquitoes?" is the practical question asked by a miner preparing for departure to Alaska. It is worth serious answer. The mosquito is an additional menace to Alaskan residence. Petroleum finely sprayed over the hatching ground is fatal. Permanganate of potash is also a destructive agent. Two and one-half hours are required for a mosquito to develop from its first stage, a speck resembling cholera bacteria, to its active and venomous maturity. The insect in all its phases may be instantly killed by contact with minute quantities of permanganate of potassium. It is claimed that one part of this substance in fifteen hundred of solution distributed in mosquito marshes will render the development of larvæ impossible; that a handful of permanganate will oxidize a ten-acre swamp, kill its embryo insects, and keep it free from organic matter for thirty days at a cost of 25 cents; that with care a whole region may be kept free of this pest at a small cost. An efficacious method is to scatter a few crystals widely apart. A single pinch of permanganate has killed all the germs in a 1000-gallon tank.

Mining Summary.

CALIFORNIA.

Amador.

W. S. Weymouth is operating the Webster mine at Quartz Mountain and is building a 5-stamp mill.——At the Baliol mine the new shaft is down 50 feet. The new hoist will be run by steam.——J. A. McIntire started the pump at his mine near Amador City, preparatory to doing further development work. Mr. McIntire has secured bonds on several adjoining claims.——At the Pocahontas, near Drytown, Supt. McWayne is driving the crosscut on the 600 level, and on the 400 level the drift is in 400 feet. Quartz showing free gold and sulphurets has been found, and from present indications the condition of the mine will soon warrant the erection of a mill. Three thousand feet of underground work has been done at a net cost of $35,000.——The Pocahontas mine, near Plymouth, is still exposing good ore in the upper drifts.——The shaft of the Zella will be sunk 200 feet deeper and work will begin soon.——The shaft of the Amador Queen No. 1 has reached nearly 1000 feet.——In the Kennedy mine, at the 2400 level, in the north shaft, a large body of ore has been found that will pay to mine and mill. The Kennedy has yielded nearly $8,000,000 since its location in 1860, and has paid nearly $3,000,000 in dividends. The north shaft is down 2400 feet on the incline, but vertical it would be 2150 feet. There is a second shaft down 600 feet south of the north shaft, which is being sunk to the level of the other, to intersect the drift now being driven southward from the north shaft. There are levels every 100 or 200 feet, and work is being prosecuted in all of them.——At Amador City a new ore body has been discovered in the Keystone mine. The ledge is 40 feet wide and extends from the 500 to the 800 level. The main shaft in the mine is 1400 feet deep, but the principal work of recent years has been on the 600 level. The ore will average $10 a ton.

Butte.

At Nimshew the Matheson mine has resumed operations.——The Boulder placer mine is working day and night.——Owing to the low water this spring in the middle fork of Feather river, men are locating claims in places where they were never able to mine before.——At Cherokee, Portuguese have obtained the right to work the tailings from the Spring Valley hydraulic mine. Those tailings fill Saw Mill Ravine 50 feet deep and 100 feet in width and are believed to pay well. There were large lumps of clay that came down from the banks which were never dissolved and these are known to contain gold. These clay lumps have been slaked and can now be worked. A line of sluices and water power derricks will be used.

Calaveras.

Dispatch: At the Gwin mine they have an 8-foot ledge in the face of the south drift on the 1400 level. At the south or old Gwin shaft, they have the water down to the 1200 level. The pumps are run by compressed air. Free coarse gold has been drawn up by the pumps and the water is full of sulphurets.——The Machu mine has been cleared of water and the work of taking out ore has commenced.——At the Empire and Billy Williams work is pushed steadily under the management of F. Rainville; each place is working ten men.——The Champion, under the management of W. B. Everett, is putting in machinery and in a few days the pumps will be started. This mine is 950 feet in depth; the water comes within 50 feet of the surface.——The Keltz is taking out ore for shipment.——Griswold & Jewell of Sandy gulch are working two shifts at the Hubert mine on good ore.——The Holliday M. Co. at Douglass Flat have their shaft down 65 feet in good gravel.——The Ohio M. Co. are working two shifts on development work.

El Dorado.

At the Union mine, near El Dorado, a gasoline hoist will be placed in the tunnel, to sink 500 feet on the ledge.——T. S. Houser has discovered some good ore in the Honolulu mine, near Georgetown.

Inyo.

At Mono lake two cyanide plants, one at Lundy and the other at Copper Mountain, are to be put up this spring, and a hydraulic outfit will be placed between the lake and Lundy.

Kern.

Miner: G. M. Rose had ten tons of ore from the May Queen run, which turned out $90 per ton.——A force is working on the Blackhawk taking out good ore.——C. A. Burcham is working the O. K. mine with ten men and has a ledge about 3½ feet thick; the ore is estimated from $40 to $100 per ton.——The leasers made a shipment of thirty tons of ore from the Sister mine. They are sinking a 200-foot shaft. The ore runs from $15 to $18 per ton at present depth.

The King Solomon mine at Garlock has been improved by an air shaft from the 315-foot level.——Miles & Buckley are taking out some low-grade ore from the Sunrise mine.——Rich ore was milled at the Red Dog mill from the Butte mine.——The Red Dog mill is running regularly; several ore teams are bringing ore all the time.——The Mineral Hill group in Panamint has been sold to M. Day of Los Angeles for $8000.——Twenty men are employed at the St. Elmo mine and ore is being shipped to the Victor mill daily.

Mariposa.

(Special Correspondence).—Only development work is in progress at the Merced properties. Sinking continues in the main shaft of the Mary Harrison, which has reached the 700 level, and is being enlarged at the top to three compartments. Drifting from the old workings toward the shaft is in progress on the 500 and 600, and connections will be made within a month. A winze is being sunk from the 600. All developments show good ore. Considerable work has been done in the way of filling stopes which were but slightly timbered last year, and have caused much trouble by caving. New hoisting works are to be built at the main shaft, and the large engine now lying idle at the Louisa shaft will be moved there. Officials of the company in the East still announce that large additions are to be made to the present milling capacity of forty stamps.

F. A. Farnum has succeeded E. J. Gilbert as Supt. for the California Exp. Co. at the Virginia. Owing to frequent changes and adjustments of machinery, the new mill has been unable as yet to make a continuous run. The cleanups from the two short runs have been very satisfactory. The company has been making extensive surveys with a view to either bringing water to the present mill or transporting the ore to a new mill site, three miles away, on the Merced river.

The Montana M. Co., lessee of the Louisiana, is keeping the mill running steadily at its full capacity with good returns.

The Compromise mill made a two weeks' run on ore from the new chute. The result was a profit over all expenses from the free gold, without taking account of the sulphurets, which carry about one-half the values of the ore. The old shaft, 400 feet deep, is being reopened, and will be pumped out.

The Bondurant tunnel is now in 900 feet, without cutting the vein, which it was expected to tap in about 500 feet. As the tunnel has drained the old workings, it is thought the vein is not far away now.

A small force is working at the Red Banks. The large body of ore cut about the first of the year in the Crown Lead proved to be only a bunch, and further work is under way to reach the main ore body.

Seven or eight quartz pockets have been taken out within the past thirty days, ranging from $500 to $4000.

Mariposans are well satisfied with the showing of the county for 1897, having moved from sixteenth place up to fourteenth, and showing the largest increase, except Tuolumne and Kern, of any in the State. Notwithstanding the threatened water famine, a slight increase over the figures for 1897 is looked for during 1898.

Mariposa, Cal., May 2nd, '98.

Placer.

Sentinel: The Hidden Treasure Drift Gravel M. Co. at Sunny South has 269 men on the pay roll. Four hundred tons of gravel are daily taken from the mine. A storage reservoir is being constructed.——The new tunnel at the Herman quartz mine near Westville is in over 800 feet. It is 5x6 feet in size and two shifts of men are making about 36 feet per week.——The J. G. Peters M. Co., organized last week, commenced operating near Dutch Flat. They have purchased the Opel & Williams claim, and will run a 500-foot bedrock tunnel to open it.——Good quartz has been struck in the Azalea mine at Blue Canyon. The tunnel has reached 800 feet, the whole face showing quartz. Several small stringers have assayed from $2 to $7 a ton. The company is running the tunnel for a gravel channel.

Plumas.

Work has resumed at the Four Hills mine, near Johnsville.——The Plumas-Eureka, it is stated, will keep a small force at work during the summer.——P. Laurenzi has begun work on his Gold Lake property.——The Golden Ancient M. Co. of San Jose will sink a shaft on Bear creek.——Work continues in the Slate Creek tailing claims.

The *Bulletin* says that, notwithstanding the dryness of the season, the outlook for mining on the North Fork this year is reasonably good.——The Pliocene drift mine is being worked by Austin & Cadle, who are getting good pay.——A. Cameron is working his drift mine with reasonable success.——The Dunn Bros. are running their mill on ore from a 3-foot ledge.——Bennett & White are putting in a wing-dam and preparing to work the White River Bar property during the coming season.——Hickerson & Davis are working a drift claim near Independence Bar. In their development work they have made more than expenses.

San Diego.

The ledge on the Stratton mine, in the Mesquite district, is 3 feet wide and goes about $25 per ton.——W. D. Luce is working the old tailings of the Cargo Muchacho mine with a cyanide plant of 100 tons capacity. There are about 100,000 tons of tailings going about $2 per ton in gold.

Shasta.

Activity in mining about the old town of French Gulch continues.——The Washington M. Co. has resumed leasing ground and has a number of leasers at work.——The American mine, owned by San Francisco parties, has been bonded to Eastern people.——G. Reinhaus has a force at work on his property. He has taken out ore which he is shipping to the smelting works. It is believed the ore will yield $100 per ton in gold.——The Brunswick mine is under bond for $35,000.——F. B. Rossi is running four stamps and crushing eight tons of ore per day, expected to yield $20 per ton.——Howell & Motherwell have been operating the Three Sisters mine for several months under a bond.——H. Paige, near Shasta, is running a tunnel on the vein and has reached 250 feet.——Cook & Co. purchased four quartz claims on Mule mountain and have commenced development.——The Boswell Bros. sold a claim near Shasta to Knox & Co., who have commenced development work.——T. Price has sold his quartz claim near Middletown. The purchasers are sinking a shaft.

W. S. Boyd, near Shasta, has a tunnel 100 feet on good ore. He contemplates building a 5-stamp mill.——Diestelhorst Bros., who have been successfully operating the dredger in the Sacramento river, near Redding, are wingdamming the stream near the same place.

Siskiyou.

The ore being taken from the Little Queen mine near Fort Jones is said to yield $50 per ton.——Sargent & Dayton are driving a tunnel on a ledge that varies from 6 to 24 inches. They have fifteen tons of ore on the dump.——D. Jones will shortly start his mill on the Gray Eagle mine.

Journal: The LaFlesh & Co. quartz mine, near Henley, is worked constantly with good success.——The Jilison & McIntosh quartz mine continues to pay. The ledge is about 2 feet. Thirty men are employed.——The river miners in the Honolulu district are hurrying work day and night, on account of the river being lower than general. The McConnell & Quinne claim, Manzanita Bar claim and Vesey Creek claim are enclosed with wing and head dams and are hoisting gravel. The Pacific mine, Benz Bar mine and several others are ready for hoisting. In a few weeks more every claim on the river from Hornbrook to Hamburg will be ready for hoisting gravel.——H. H. Hunter is working in the lower tunnel of his Cherry Hill quartz mine, with the intention of putting in a quartz mill next fall, there being insufficient water at present for a mill. He has taken out about 300 tons at the upper level from a tunnel 350 feet.

News: The Minetti B. mine has resumed operations.——Two giants are at work on the Grider mine at Sciad.——Baker's quartz mill on Indian creek is running steadily.——The Bunker Hill mine, near Happy Camp, is still running.——The Gold Ball mine is running night and day on good ore.——There is a suit pending in the Superior Court which is of interest. C. J. Fry and T. Macauley entered into an agreement with J. McCaw for the sale of their mining property near Fort Jones. McCaw was to pay $2500 on or before April 22, which was to be the first payment for the full amount—$35,000—to be paid for the mine. On that day McCaw was on hand and tendered the money, which was refused, Frey and Macauley claiming that McCaw had not fulfilled his part of the agreement. McCaw has brought suit for the specific enforcement of the contract and asks for an injunction restraining Fry and Macauley from mining pending the determination of the case.——Five hundred tons of ore was crushed by the Gold Ball M. Co., on Salmon, and the cleanup amounted to $6000.——At the Shurtleff mine, on Humbug, seventeen men are employed. They have a 4-foot ledge of promising rock.——A large amount of development work has been done on the Gold Run mine on Know Nothing creek and a quantity of good ore uncovered.——The King Solomon and Queen Sheba mines on Mathews creek have been incorporated under the name of the Canyon Mountain M. Co. Upon this property there is an 8-stamp mill which crushes twenty-five tons per day. The returns show the ore to be worth $10 per ton.——The Siskiyou mine, near Happy Camp, expects to run two months longer this season.

Trinity.

Notwithstanding the light rainfall of the past winter and the present low streams in the Coffee Creek district, a great deal of prospecting is being done there.——Truax & Dillon quartz ledge made a strike on the east fork of Coffee creek.——On Morrison gulch they have a ledge which will yield $35 a ton. The ledge is 4 feet in width. The ore is estimated to yield from $400 to $600 per ton.

The Enterprise mine, near East Fork, is crushing a fair grade of ore.——At New River the Mountain Boomer mine is worked by leasers with satisfactory results.

Tulare.

At White River, Makey & Brooks struck a 15-inch ledge in the Woody mine that assays $50 a ton.——Dunlap Bros. are taking good ore from the Richelieu mine.

Tuolumne.

Thirty years ago the Agnes gold mine, then known as the Good Friday mine, was worked superficially. Ore stoped on the south vein returned in a custom mill about $20 per ton. Since re-opening the Agnes mine, the east drift from the shaft has been extended a short distance, and a drift has been run west 12 feet, all on ore. A new company recently formed is doing considerable development work under the superintendence of W. H. Storms.

Democrat: The new shaft on the Mt. Jefferson has attained a depth of 200 feet and cut a new ore chute; sinking will be continued to the 400-foot level and then suspended temporarily to drift. At the 100-foot level the vein is being drifted north and south, showing a width of 9 feet, with ore worth $20 per ton. At the 200 the vein has been crosscut, a station put in, and drifting begun. At this point the vein is 10 feet wide. A large amount of ore is ready for crushing, and when the mill is completed there will be plenty for steady running.——The Scanavino mine, near Cherokee, has started up with J. E. Summers as Supt.——The Dreisam's new mill will have its stamps dropping soon. In the mine everything is progressing.——The force under Supt. Tonkins has cut the vein of the Blue Lead after driving the crosscut tunnel several hundred feet. The ledge, though not large, is rich.——At the Kanaka mine ore is being extracted from three tunnels. The vein varies in width from 2 to 4 feet, with a rich streak of pay ore, although all the quartz mills $10 per ton.——The mine is reported clearing $6000 per month, though its output will be largely augmented by the addition of milling improvements now under way. The quartz carries sulphurets which assay high.

Independent: The No. 2 shaft of the Trio mine is down 400 feet. The No. 1 shaft has been sunk to a greater depth.——The Continental mine is being worked to a limited extent with encouraging results. An arrastra is used on high-grade rock.——At the Draper mine the company has not put up any machinery, but will do so soon.——The water is all out of the Bonanza mine this week and they are preparing to sink.——The Rawhide M. Co. will add forty stamps to their mill, increasing its capacity to eighty stamps. The company is interested in the electric plant being built at Phœnix lake. This plant will generate 2000 H. P. from 500 inches of water and a 900-foot fall. The Rawhide mine at present uses 150 H. P.——The Riverside mine, near Columbia, has been reopened and work progresses. A force is replacing timbers and clearing out the mine, getting ready to work the property in a systematic manner.——At the Black Oak mine a cement bulkhead has been put in on the eighth level to hold the large body of water which was recently encountered there. The bulkhead is 3

STEAMERS TO KOTZEBUE SOUND.—PACIFIC COAST and KOTZEBUE SOUND TRANSPORTATION & TRADING COMPANY'S (JOHNSON-LOCKE MERCANTILE COMPANY, Agents,) New Steamer, the GRACE DOLLAR, capacity 300 passengers and 800 tons of freight, will leave San Francisco June 1st for St. Michaels and Kotzebue Sound.

Passengers intending sailing for Kotzebue Sound are reminded that the GRACE DOLLAR is a newly built, triple-expansion steamer, lighted with electricity, with every modern convenience. Her bows will be sheathed to enable her to make early progress through the breaking-up ice in Kotzebue Sound, thus landing her passengers ahead of sailing vessels or other competitors.

Passage on the GRACE DOLLAR insures an early and a safe arrival in Kotzebue Sound.

The GRACE DOLLAR insures at lowest rates of insurance, while many of the antiquated sailing vessels now being advertised are forty to forty-five years old and cannot insure at any rate.

The KOTZEBUE SOUND TRANSPORTATION & TRADING COMPANY will erect at a convenient point on the Sound a store, trading post and warehouse, where supplies will be kept for the convenience of miners.

THE INITIAL TRIP OF THE GRACE DOLLAR WILL BE MADE FROM SAN FRANCISCO TO KOTZEBUE SOUND.

Thereafter she will ply between St. Michaels and Kotzebue Sound, making three or four trips a month, and will connect with the steamer "Morgan City" for San Francisco.

For freight and safe passage apply to the JOHNSON-LOCKE MERCANTILE COMPANY, 609 Market St. (Passenger Office), or 204 Front St.

feet in thickness. An iron pipe has been placed so that the water can be pumped out as desired. The chute of ore discovered on that level almost doubles the present value of the mine.

NEVADA.

W. J. Douglass has fourteen men repairing the flume and ditch, preparatory to starting up the concentrating machine on the Douglass tailings. A test of a thirty-day run will be made.——The Boston & Nevada Co., operating a year ago on a copper property at Yerrington, have decided to resume work and prospect the vein to greater depth.

OREGON.

The first cleanup of the Oregon Gold E. Co., proprietors of the new cyanide plant in operation at Ashland, was made and information is given out that the test has been sufficient to insure the success of the process in extracting gold from the ores of southern Oregon. Several bricks of amalgam were realized at the cleanup, one of which weighs eight pounds. ——Knighten & Mayfield shipped ten tons of ore to the Huffer mill near Jacksonville.—— The Lewis M. Co. of Leland has 200 men building their ditch from Grave creek.—— Operations at the Ashland-Mattern property are progressing. A quantity of good ore is being taken out daily, and the mill is kept at work with good results.——M. Van Brunt, the New York capitalist who purchased the Steam Beer mine near Leland, is enlarging the ditch to his mine, seven miles long, and will put in a pipe line 3500 feet. He also contemplates building another ditch ten miles long for getting a greater head of water, with the end in view of working his mine all the year.——It is stated that the Golconda Co., near Baker City, has determined to adopt the chlorine-bromine process. The company owning this process has entered into agreement with the Golconda people to treat their ore up to a certain per cent for less than $1 a ton. The new plant will cost about $100,000 and will be capable of treating a large amount of ore daily. The Columbia M. Co. has also tested this process and has decided to put in a 100-ton plant. They shipped a carload of ore to Denver and found this process to be satisfactory.

WASHINGTON.

The Ben Hur people at Republic are running a crosscut tunnel to tap the ledge.——Work on the Admiral is progressing. The face of the tunnel is in good quartz.——Returns on the fourth carload of ore shipped from the Republic mine amounted to 9.85 ounces gold and 6.65 ounces silver, and the value was $207 per ton, which is double that of the first carload shipped in February. The four carloads shipped by this mine have shown increase in values, the first shipments being from the upper workings. The four cars returned values as follows, respectively: $103, $114, $169 and $207.——The Comstock, near Colville, has resumed work and will ship by the first of June.——The Enterprise mine has developed 2 feet of silver-lead ore.——The Bonanza mine has resumed work and is shipping at the rate of one carload per day. The Bonanza mine is down 400 feet and has a width of at least 30 feet of pay ore.——The Lake View Co. is pushing work on the Fannie claim. The ore streak in the ledge is 18 inches wide, and assays as high as $60.80.——Near Camp Sheridan the Polar Star is bonded for $40,000.

BRITISH COLUMBIA.

(Special Correspondence).—H. M. Wright of Seattle has a choice of two options on the Devil's Lake M. Co's. ground on Canyon creek. On one option the vendors receive $4000 cash and 40% of the stock in a new company. The other option is for $30,000 cash for the whole. About $3000 has been expended in partial developments and it is generally believed that a few thousand more will make this one of the best drift gravel properties in Cariboo. The headwaters of the Peace river will be thoroughly prospected this summer—a large number of men from the States are going via Quesnelle. Capt. Black has sold his hydraulic ground in Omeneca to an English syndicate for $200,000.

Barkerville, April 15th, '98.

ALASKA.

(Special Correspondence).—The mushroom metropolis of Skagway is in the throes of a mining boom. Placer location notices are plastered all over town, from the mountain to the wharves, as well as along the course of the river, while numerous dikes, quartz stringers and light stains are adorned with quartz notices even when a pack-train of turkey buzzards would be essential for their successful operation. Men are perambulating with picks and pans and a kind of a lost, vacant look. They are evidently dazed by the distinction between mica, or "Pilgrim gold," and the pure quill, besides being at a loss to know just where to look for the gold. This boom is laying the foundations of many a lawsuit, as in Skagway the locations have been made over those for town lots and take in all of the buildings, including the post-office. To a man up a tree, it looks like an advertising scheme, coming as it does at this time. The Skagway wagon-road is practically completed; the old trail has been repaired and reopened. Dyea is under a cloud on account of the recent fatal avalanche, and it is a favorable moment for Skagway to attract attention to its superior accommodations and make a play for the summer and fall travel over the passes. This belief is not only warranted by the appearance of things, but is borne out by the geological and mineralogical conditions of the surrounding country as far as discovered. There is some hungry quartz in the adjacent mountains, but as far as tested by the writer, it is decidedly low grade, and much of it is as base as many a Klondike mining scheme. Although the formations have been shaken up and are seamed by numerous dikes, they do not appear to contain any mineral centers of note, although the indications are more favorable on the South Fork than upon the North Fork of the Skagway river. If quartz mining ever amounts to anything in this section, it will be through striking something better than anything yet found.

In regard to the placers, some gold was picked up; but, although it was the genuine article, it had the appearance if not the flavor of "salt." Aside from that, a few colors have been found, but for size and value they strongly resemble geometrical points. A stray color or two no more make a mine than a single swallow makes a summer. Even if there were no quartz in these mountains, the erosion of the crystalline rocks composing them would leave a small residuum of gold; and while there is some gold along the river, it is extremely unlikely that it exists in paying quantities. A. THURSTON HEYDON.

Skagway Trail, April 11th, '98.

THE KLONDIKE.

Secretary of the Treasury Gage has been officially notified that the Canadian Government has now established offices on the passes from Dyea and Skaguay, where licenses may be obtained by those crossing the mountains and desiring to engage in mining across the Alaska border in British territory.——A bill has been introduced in the Canadian Legislature to authorize the Government to borrow $5,000,000 for the construction of railways in the province. Of this amount $1,500,000 is for a railway from a port on the northern coast to Teslin lake, the headwaters of the Yukon, thus providing an all-Canadian route to the Klondike.——A cut-rate war has been in operation between the Chilcoot Railway & Transportation Co. and the Dyea-Klondike Co., and rates have dropped from 12 and 14 cents to 8 and 9 cents.——A Lake Bennett, B. C., dispatch, dated April 26, says 3000 people are located there on their way to the Yukon.

UTAH.

The Mercur has uncovered a new ore body in the third vein which is 14 feet wide and of good milling quality.——Two lots of ore from the Martha Washington showed 183 ounces silver, 4 per cent lead and $2 gold per ton.—— Work has resumed on the Daisy Dean group at Marysvale, on which ore has been found that shows from $27 to $57 gold.——The *Tribune* says that at North Tintic J. L. Hunter, Mgr. Hot Stuff, which has been under development for two years, will continue drifting with the vein off the 150 level. It was known as the Mammoth of the North, the smelter record showing that the ores averaged 14 per cent copper and $5 gold per ton, with 43 per cent iron.——The Utah mine shipped fifteen tons of ore that showed 178 ounces silver and 42 per cent lead to the ton.——The Mammoth mill is dropping forty stamps.——The Cleveland will prospect its ground off the Sioux-Ajax tunnel.——Twenty-nine bars of bullion, containing about 60,000 ounces, were sent out from the Eureka-Hill mill last week.——A majority interest in the Old Fred mine at Mercur has been sold to B. T. Lloyd and associates of Chicago for $80,000. The property has three veins, one of which is 60 feet wide, and upon which drifts have been run 300 feet. ——The Blue Mountain Co., near Monticello, have a vein 25 feet wide containing a 6-foot streak of silver ore. Assays show 137 ounces in silver and $5 gold to the ton.——The transactions in the ore market at Salt Lake last Saturday amounted to $25,431.——The shipments from Tintic last week comprised eighty-one cars of ore and thirty-two cars of concentrates.——A test run on the Ontario tailings at Park City is satisfactory and it is thought the several thousand tons that have accumulated can be worked at a profit.

The monthly output of the Bullion-Beck is 1000 tons per month.——In the Alpha at Deer creek a 30-inch vein has been found that assays $10 gold and 2⅔ ounces silver per ton. ——The Lizzie Dean group is producing some good grade silver and lead ore.——In the Treasure Hill, near Silver City, sinking has begun from the 600 level. The company shipped ten cars of ore.

IDAHO.

Three veins have been struck in the Lucky Boy tunnel, near Idaho City, which is 640 feet long. The first vein, 14 inches wide, was struck after running in 600 feet. This vein will mill $40 or $50 a ton. A crosscut was run and another vein struck, 4½ feet wide, that will mill $12 a ton. From the face of the tunnel another crosscut was run, cutting another vein, 4 feet wide, of $4 ore. These veins are nearer together than they were in the old works, 150 feet above. The Lucky Boy is under bond to J. B. Reno, W. B. Neal and J. K. Fleming.——G. S. Anderson has secured a bond on the Gettysburg group of claims, near Mullan, and work will be done on the property soon. The group embraces the Gettysburg, Gettysburg Fraction, Independence and Helena Fraction, situated east of the Evening, and the You Like, two of the greatest mines in the Cœur d'Alenes. The consideration for the entire group is $51,500.—— W. B. Wickham is arranging to start the cyanide works on the Gold Belt mine at Hailey. The capacity of the works will be increased to the fullest extent permissible by the water supply.——The Idaho Con. M. Co., at Warrens, has done 50 feet of work since Jan 1st.——The Goodenough is opened to a depth of 300 feet and has a large amount of drifts. This is the deepest work in the camp. The Goodenough has a 5-stamp mill. It made a short run last fall and took out some $7000.——The Honest John Co. owns the Iola group, which is extensively developed, having about 1500 feet of work done. It is 200 feet deep.——The Bedrock Flume Co. has had a force at work prospecting during the winter. They have cut the channel and found it rich, and work is to be begun at once on the flume, which will be two or three miles in length. The company will invest about $100,000 in putting in its works. It owns 200 acres of ground on the meadows below the property of the dredge company.——The dredge company, a Philadelphia corporation, is planning to put in a different plant.——Gambs & Wood have a bond on the Charity claim and are developing the property.——The Poorman mine, near Florence, penetrated a ledge measuring between 12 and 15 feet in width in their tunnel, which is being driven beyond the 500-foot mark. Assays as high as $300 were had, which will average between $50 and $60 for its entire width.

The Potosi mine at Silver City has seventy tons of ore ready for crushing.——The Queen mine at Neihart has found a new ore chute from 14 to 20 inches wide of high grade. Twenty-five men are employed in the mine. ——The Badger mine at Grangeville contemplates the erection of a large hoist.

MONTANA.

Among the mining deals near Butte is the reorganization of the Monitor M. Co., owning the Monitor tunnel, 1400 feet long, and about ten claims in Park canyon. The reorganized company is composed in part of Butte men, but principally of Chicago capital represented by Mr. Pomeroy. A shaft will be sunk on one of the properties belonging to the Monitor Co. a depth of 500 feet.——J. Patten of Garnett shipped five carloads of ore from his claims of a high grade and nets about $2500 to the car. He has about twenty cars on the dump.——The work of further development on the Inter-Mountain mine, near Garnett, continues with encouraging results. A large body of good grade ore has been blocked out since operations on the property were resumed a month ago.——J. Connolly shipped a carload of gold rock. The shipment aggregated thirty-seven tons and yielded a good return.——At Neihart Jennings & Co. are at work on the Whippoorwill and have twenty-five tons of ore on the dump which, besides silver, runs well in lead and copper.——At Barker the Tiger mine made its initial shipment.——The Liberty is extracting good ore. The Wright and Edwards and Moulton are also among the producers.——D. H. Steele is again at work on his long tunnel near Rochester. After running for nearly 1000 feet through comparatively barren ground he is entering ground which indicates the approach to a body of ore.——Mr. Alderson, near Red Bluff, has the Mohegan mill at work again treating tailings.——F. A. Heinze has leased and bonded the Cora mine in East Walkerville for $90,000 for six months. The new operators are already at work and will erect necessary machinery. It is developed by two shafts, one 600 feet deep, since caved, and another shaft of 200 feet.

The Big Seven mine, near Neihart, employs twenty men and ships five cars of ore per month. The property is a gold and silver producer and has been under development for eighteen months. It paid four dividends last year and three since Feb. 1st, the last one amounting to $36,000.

SOUTH DAKOTA.

A vein of copper of good value is said to have been discovered in the Great Northern mine at Two Bit.——At Terry the Golden Reward is working 100 men, most of them in the Tornado and Ruby Bell.——The Horseshoe is working seventy-five men in the Mogul and taking out high-grade ore.——The Delaware shaft is down 325 feet and is working twenty-five men.——There are five outfits at work in the gravel beds near Mystic. They have sunk shafts to bedrock, the deepest place being 37 feet, and have in large machinery, and are meeting with success.——Sullivan & Co. from the Durango mine, on the Lead City divide, last week shipped two cars of ore to the Kansas City smelter that will average $100 per ton in gold. Assays have gone $165 per ton. The ore shoot from which the product was taken is 40 feet wide and 3 feet thick.

COLORADO.

Two carloads of ore shipped from the Birch lease on the Mary McKinney, Cripple Creek, netted $5700. A like shipment is now at one of the local smelters that will run higher.—— Considerable good ore is being mined in the different leases in operation on the Dante. In the Reed and Phillips shafts crosscuts are being driven at a depth of 450 feet. There is a good body of ore in the 300 level, which is being stoped.——Vaughn & Christian have cut at 375 feet depth the blind vein that was opened at 270 feet in their block on the Hull City placer, and find it carrying good ore, making the third producing level upon it.—— The Pharmacist is getting rich ore in the bottom levels, and the development in the new shaft promises to largely increase the revenues during the coming year.——The Union Co.'s territory on Bull hill is being operated by lessees and is producing ore regularly from four shafts. The company is engaged in sinking the Orpha May shaft to a depth of 800 feet, where a new station will be cut and drifts and crosscuts run to prospect the vein. It is down 750 feet. From the Porcupine shaft a shipment was sent out last week that went at the rate of $163.40 for the first grade and $33.80 for the second grade. From the Pike's Peak shaft there was one shipment of a little less than five tons of low grade that went $20.——Nolan & Co. are making regular shipments of ore mined on the Lelia. In places the ore body is 3 feet wide. It averages about $50 per ton.——Peterson & Co. sent out a shipment that went $60 per ton. At this lease there is quite a body of ore running from $10 to $15, but it hardly pays to work. ——In the eighth level on the old Portland vein and chute some rich ore is being mined. The body is fully as wide and as rich as in any of the upper workings. Four different ore chutes have already been opened at this level, and two more are known to exist and will be entered as fast as drifts and crosscuts can be run. In one of the chutes that is now being worked at this point there is a stratum of sylvanite 3 inches wide of high grade. Assays run as high as $3000 per ton. The output at present is eighty tons per day.——Whiteside & Stark are producing ore at the rate of about five carloads per week that has an average value of $60. The high grade is being saved for a separate shipment.——A new find has been made on the south end of the Modoc. The first shipment assays $50 per ton.—— Royalties from the leased block are more than meeting the expenses of operation and development work being done by the Union G. Co. The Orpha May shaft has been sunk 150 feet from the 600-foot station, but the management has decided on going to 800 feet before crosscutting for the vein.——Putnam Bros. are sacking the bonanza stuff opened in their Pointer, and the showing for the mine is big. It is in the formation that has produced the big mines of the district, but in a locality that has so far revealed nothing of great importance.——Hemenway & Jenkins sent out a twenty-ton shipment of five-ounce ore from their Longfellow.——At the Modoc the usual output of thirty tons of high grade ore was made last week.——A strike has been made by Jones and others leasing on block No. 1 of the Specimen, which promises to become one of the big things of that portion of the hill. Drifting at the 200-foot level, a narrow streak has widened out to nearly 3 feet, that runs without sorting at the rate of $60 per ton.

Killum & Ogilvie are shipping about fifteen tons per day that has a gross value of close to $1000. The drift at the second level is still being extended. The grade of the ore is fully as good as in the upper workings.——The chute on the Birch lease of the McKinney lease is nearly 300 feet in length. The pay streak is not wide, but the ore runs from ten to twelve ounces a ton. The output for April was about eight cars, and it is believed this will be doubled in May.——Two deals for Cripple Creek properties were closed for the Battle Mountain Con. Co. by which the company becomes possessed of the Uinta tunnel and a controlling interest in the Arequa G. and S. M. Co., owning the Trail and Big Banta groups on Battle and Bull hills, and the Battle Mountain Co. at the same time takes the field against the Portland in the suits instituted against J. Doyle. There are other matters involved that, aside from the $200,000 the transactions represent, go to make them the most important sales that have taken place in years. J. Doyle has sold to the Battle Mountain Co. a control of his stock in the Uinta Tunnel M. and T. Co. on a basis of $150,000 for the property. He retains a portion of the stock and continues as president of the company.——The purchase of the control of the Arequa Co. was made from E. M. De La Vergne of the Raven, on the basis of $65,000. The Battle Mountain Co. through this purchase gains possession of thirty acres in the heart of the district. The properties of the company are the Big Banta, Old Ironsides, the Trial and Lost Fraction. There are three shafts on the Trial and one on the Big Banta, which have produced good ore, and they rank with the promising partially developed ground in the district.

The Johnstone lease on the Republic at Cripple Creek is producing from $1200 to $1600 a day, the shipments averaging twenty tons and the ore running from three to four ounces. ——Hoffman & Co. have been sending out a carload of ore a day from their lease on the Zeolite and are getting more rock than they can conveniently handle with the present equipment.——The Belle of the West Co., a Chicago company, has decided to enlarge its operations, put on a steam plant and erect a mill for the treatment of its ores. Supt. C. C. Burch reports a considerable amount of mill dirt in a vein 40 feet wide.——The Gold Sovereign is shipping high grade mineral from four shafts. A seven-carload shipment was made that went $70 for the low grade and $136 for the first grade.——Some rich ore is being mined on the Garfield Con. There is a seam of ore from 1 to 3 inches wide. The property is producing at the rate of about $1000 per day.——Whiteside & Stark are getting out one carload of ore per day, averaging from $35 to $40 per ton.——Bodfish Bros. sent out a two-ton shipment running $376 a ton. ——The McDowell lease on the Venezuela is making regular shipments, sorted into two grades. The first class runs about $150 and the low grade $40 ——Ryan & Hanley made a two-carload shipment from the Excelsior, running from $250 to $350 per ton.——Ogilvie & Co. made a ten-ton shipment from the Mountain Beauty, estimated at from three and one-half to four ounces a ton.——Murray & McCormick average four tons of $50 ore a day from the Mattie D. of the Ingham.——Anstie & Von Hemert, in their lease in the Jefferson Co., opened a chute in the 300-foot level from which they have sent out a gross value of ore up to $30,000, the royalties netting the lessees $17,000. One carload sent out in three grades ran $800 for the first grade, $480 for screenings, and the lowest grade ran $100 a ton. The last car ran $108, and they are still netting $1000 a day.——A shipment from the Lafayette at Georgetown yielded 186 ounces silver, 7 per cent lead and one-tenth ounce gold per ton.——From the Bullion at Argentine a shipment returned 288 ounces silver, 36 per cent lead and 16-100 ounces gold.——The Specimen Co. at Cripple Creek has a 4-foot vein of $60 ore. A forty-eight-ton shipment of different grades yielded $2325.—— A twenty-two-ton shipment was made from the Water Ditch shaft on the Pharmacist that run four to five ounces to the ton.——The Gold Dollar, on Beacon hill, is hoisting at the rate of five tons of two-ounce ore a day. This does not include the high grade sylvanite quartz being saved for a separate shipment. ——W. S. Stratton is not shipping heavily from the Independence this month. Enough ore is being broken in running drifts at the different levels to meet the payroll.——Ogilvie & Co. made a twenty-ton shipment from block 2 on the Mountain Beauty. Assays indicate a value of $60.——The ore production of Liggett & Co. on the Garfield Grouse averages $800 per day.——Shipments from the Fluorine are showing a steady increase in value. The shipments for the past week from Copper Mountain have been as follows: 76,840 pounds of ore averaging $35.58 per ton; 38,610 pounds averaging $72.20 per ton; 34,404 pounds averaging $61.50 per ton; 62,584 pounds averaging $46.40 per ton. The whole shipments

amounted to 106 tons having a total value of $12,842.03. The ore is increasing in value. Last month it ran $30 per ton. This month it has averaged $49 per ton.——The Moon-Anchor properties are keeping up their regular shipments. The company sent out 120 tons of smelting ore and sixty tons of milling ore.

The dividends declared for April in Cripple Creek by ten mines amounted to $201,500. The total dividends paid by these properties is as follows: Portland, $1,402,080; Elkton, $516,960; Strong, $350,000; Moon-Anchor, $171,000; Anchoria-Leland, $126,000; Golden Cycle, $130,000; Lillie, $80,110; Gold Coin, $60,000; Eldorado L., $6000; Vindicator, $37,500. ——At Leadville the Fanny Rawlings is doing development work at the 560-foot level. ——The Big Four gold mine is shipping each month a gold-copper ore carrying from two to five ounces gold, 5 per cent silver and some copper.——The Bimetallic smelter is running two furnaces on copper matte. The Ibex mine furnishes the smelter 140 tons daily of copper sulphides.—— The Dollie B. is increasing its daily shipments. A 1500-gallon per minute pump will be placed in the mine this spring.

NEW MEXICO.

The Klondike mine, near Elizabethtown, is running three shifts, taking out milling ore. ——W. F. Doty opened a body of ore that runs $20 to the ton near Red river.——The recent strike in the Moreno at Elizabethtown runs over $200 to the ton.——The cyanide mill at Hematite is completed and has a capacity of fifty tons per day.——The Independence mine, near Red river, has an 8-inch vein of ore that runs $50 to the ton.——In the Iron Dike mine, near Taos, the vein is 3 feet and gives an average value of $7 per ton.

The Taos M. & M. Co., at Colfax, purchased the Black Copper mine for $16,000.

ARIZONA.

The Yuma *Sun* says the Sultan Bros. finished a test run of 160 tons of ore from their Badger mine and the result was highly satisfactory.——A mill will shortly be put in the Turning Point mine, near Casa Grande, Pinal county, in which large bodies of gold and silver ores are being opened up.——Near Frog Tanks, Yavapai county, a 30-ton smelter will soon be erected, to be increased to 100 tons by Oct. 1st.——Work has been resumed in the Pinto Creek, Gila county, group of ten claims, belonging to the Pinto Creek M. & M. Co. The ore body carries good values.——O. B. Hardy, of the Planchas de Plata M. Co, and J. A. Straith purchased the Mahoney group of mines near Nogales.——The 50-stamp mill of the Mammoth mine, near Tucson, has started up. The ore body in the Mammoth is 52 feet wide, and 4825 feet of drifting has explored the property. The mine is producing 175 tons of ore per day.——The Temple Bar Co. is doing extensive work on the Colorado river, in Mohave county. About sixty men are employed, and, as soon as a cleanup has been made, other companies will probably start work and extensive hydraulic operations will be carried on.

COPPER.

SOUTH BISBEE COPPER MINING and TOWNSITE IMPROVEMENT CO.

Capital Stock, $5,000,000.

NON-ASSESSABLE.

A limited number of shares of the treasury stock are offered at TWENTY CENTS per share.

Applications for stock or copy of the prospectus can be had on application at company's office, No. 4 Bryson Block, Los Angeles, where samples of the ore can be seen and full information relative to the property obtained. T. E. ROWAN, Treasurer, or, H. W. LEWIS, Secretary.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of references Address J. D., Mining and Scientific Press.

Mining Partner Wanted

With Capital to Develop One of the Largest and Richest Mines in Nevada County, California.

A rare opportunity for right party There is millions in it For full particulars, please address S. B. FOWLER, M. E., Grass Valley, Nevada County, California.

Assayer Wanted

FOR CENTRAL ARIZONA.

Who has a button and pulp scale or outfit complete. Single man. Must be able to check against smelters and be thorough. Wages $60 per month, with board and room. Must furnish references as to ability as assayer, also honesty, sobriety, etc. Address ARIZONA, Mining and Scientific Press Office, San Francisco, Cal.

Position Wanted by Millman.

Am at present foreman of prominent gold mining company's mill; desire position in central or southern part of California; satisfactory references furnished; am thorough at concentrators, either Frue, Triumph or Norbom; have also good references as assayer, all first-class and reliable. State salary and particulars. Address Gold Millman, Box B, Mining and Scientific Press office, San Francisco.

FOR SALE.

CONCENTRATOR.

Adapted for copper, lead or zinc ores; capacity 30 to 50 tons per day; complete, new, first-class, and in perfect running order; delivered on cars, cheap for cash, with or without the steam power plant. For specifications, address P. K. MINING CO., Antelope, Idaho.

FOR SALE OR EXCHANGE FOR GOOD FARM,

A deep gravel mining claim of 9½ acres near Columbia, Tuolumne Co., Cal. Water ditch above claim. Plenty fall for working. A portion of surface has been worked. Bedrock has not been reached. Title U. S. Patent. Prospective buyers will be allowed to prospect claim.

Inquire of FRANK WILLIAMS, 3rd Street, near Holyoke, West Berkeley, or TONY ENNIS, Columbia.

Practical Running of Dynamos.

A little booklet on the Care, and the Locating and Remedying of Troubles in Dynamos and Motors.

PRICE 10 CENTS.

Catalogue B. Mechanical, Electrical and Mining Books sent free.

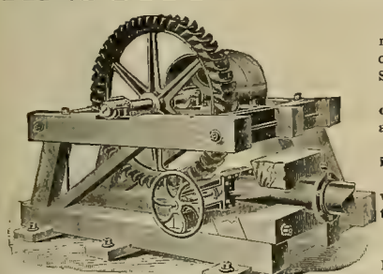
PHILADELPHIA BOOK CO.,
15 S. Ninth St.....Philadelphia, Pa.

HO FOR THE YUKON!

The A No. 1 Bark Hunter

will leave San Francisco, May 15 for

St. Michaels and Yukon River Points.



The Bark Hunter is built of white oak, copper fastened, and has lately been thoroughly overhauled and put in the finest condition. Reservations for passage and freight at lowest rates given on application. Low rate of insurance on the Hunter.

Call or address,
H. D. LOMBARD & CO.,
16 California St., San Francisco.

FOR PROSPECTORS.

A book written by a prospector, giving information on methods and appliances used by frontier miners. By mail, Twenty-five Cents, postpaid. Address "Prospector," Mining and Scientific Press office, 330 Market St., San Francisco.

KNIGHTS' WATER WHEEL.

The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel** of which there are **hundreds in use** in different States of the Union.

These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**

Address all communications to **KNIGHT & CO., Sutter Creek, Cal., or, RISDON IRON WORKS, Agents, San Francisco, Cal.**

For full particulars, send for descriptive catalogue.

WEST COAST OF MEXICO.

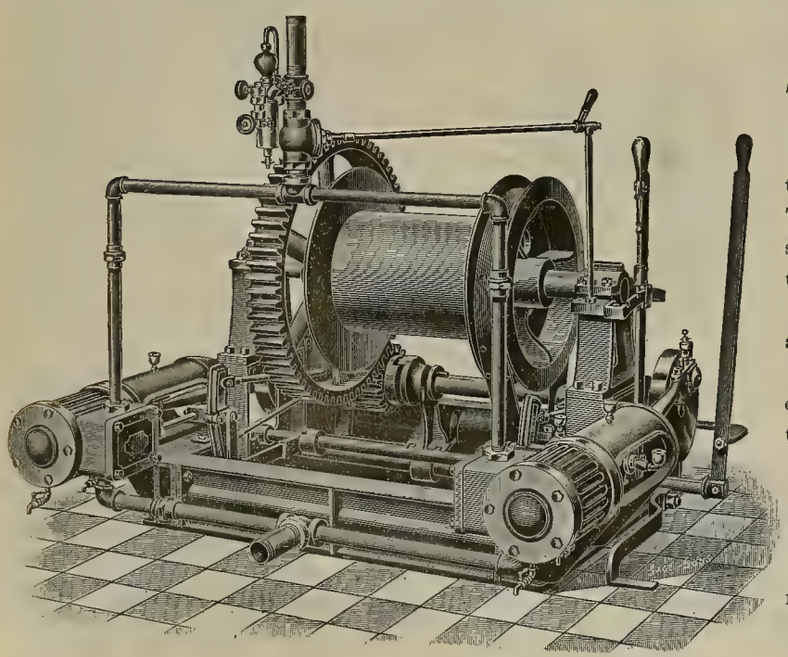
30 in. x 72 in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

Engines, Boilers,

ICE MACHINES, MINING TOOLS, Etc., Etc.

THIS CUT represents one of our improved **DOUBLE CYLINDER STEAM HOISTING ENGINES.** We have them in sizes from 12 H. P. up (with or without boilers). They are constructed with the greatest care by engineers familiar with the best previous practice. They come with sectional iron frames, reversible link motions, etc., consequently can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also have them with the Single Engines from 6 H. P. up; Boiler and Engine contained on same frame.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WRITE FOR PRICES; THEY WILL INTEREST YOU.

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT
Amalgamator Manufacturing Co.,
DENVER, COLO., U. S. A.

—WORKS:—

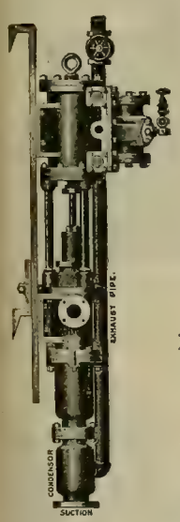
Cor. 36th and Wazee Streets,
DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

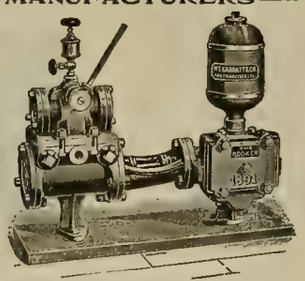
These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1....	2500	2 to 4	25 to 150	150 tons	Single operating plant
2....	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3....	7500	2 to 2¼	75 to 450	300 tons	Triplex operating plant



SWAMP AND RIVER-BED PLANTS.



Number	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

Evans Hydraulic Gravel Elevator,

— MANUFACTURED BY —

THE RISDON IRON & LOCOMOTIVE WORKS,
SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made.
It will do more and better work than any other Gravel Elevator.
It is fully protected by United States and Canadian letters patent.
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

WHITE, ROGERS & CO.,
Constructing Engineers and Millwrights,
Offices: 306 PINE STREET, SAN FRANCISCO, CAL.
Sole Pacific Coast Agents and Builders of the Celebrated
WILFLEY CONCENTRATOR.

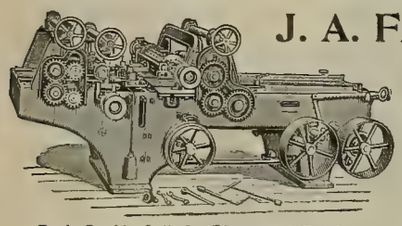
The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE $450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:



1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

Water Wheels and Motors.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend itself to all mine owners and mill men.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

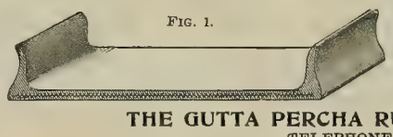

FIG. 1.

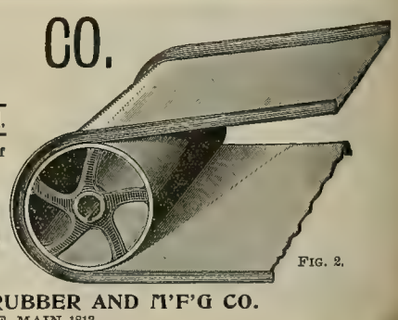

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

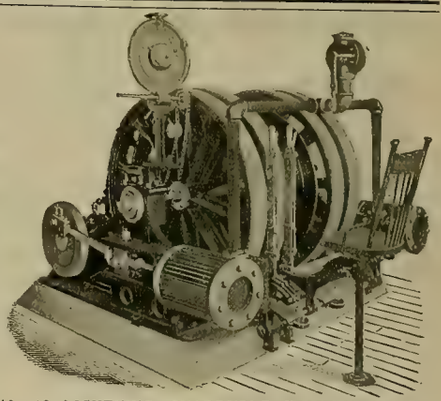
"KEEP YOUR EYE ON THE INDICATOR."

Patented March 28, 1893.



The Bolthoff Automatic Signal Alarm Indicator.

HUNDREDS NOW IN USE. UNIVERSALLY RECOMMENDED.

It is without question the most accurate indicator for hoisting engines ever constructed. Not only is there no lost motion, but it has the valuable feature of a device whereby automatically the approach to station, curves in the shaft, bad places, obstructions, or, in fact, if for any reason the engineer desires to be warned of the approach of the cage or bucket to any particular point in his shaft, either in hoisting or lowering, he can set it so that the signal bell will automatically sound its alarm.

Market Reports.

The Markets.

SAN FRANCISCO, May 5, 1898.

Prices are steady throughout, with an upward tendency. Possible war effects were discounted thirty days ago by the certainty of conflict. Paradoxical are some of the opinions as to futures. An eminent financier asserts that Dewey's smashing of the Spaniards at Manila "will be followed by a rise in European securities, including the Spanish, because this would mean an early end of the war, and therefore we should look for an advance on all the bourses and exchanges of the world." It now takes 100 Spanish paper pesetas to purchase 40 gold ones. This gives an idea of the scarcity of gold in Spain, and the premium on the same when it is to be obtained, as well as indicates the very low ebb at which Spanish credit and securities are at the present time. It is, however, a curious commentary on Spanish finances when disaster is expected to boom its securities. New York reports that the conferences between Secretary Gage and bank presidents this week has had an indirect effect upon the market. Confidence was expressed both by bankers and by the Secretary that the Government would have no difficulty in placing 3 per cent bonds at par or better. There had been some anxiety lest the Government might think it necessary to make a 3½ per cent bond in order to make sure of a quick market for a large issue. A 3½ per cent bond would, it was thought, have disturbed the status of bonds lately issued for refunding and reorganization purposes. This fear has been dissipated to a large extent.

Silver is quoted to-day, locally, at 56c; London, 26d; New York, 56⅛c. The latter city reports a steady foreign demand for copper. Lake copper continues to be quoted at 12⅜@12½c. Other metals are unchanged. Locally they are quoted as follows: Pig Iron, $19.00@22.00 per ton; Tin Plate, $4.25; Yellow Metal, 13¾c; English Cast Steel, 14@16c; Sheet Zinc, 8½@9c; Pig Lead, 5c; Bar Lead, 5½c; Lead Pipe, 5.30@5.80c; Sheet Lead, 6@6½c; Pig Tin, 16c per lb. Nails are $2.00@2.25 carloads, $2.25@2.50 small lots. Quicksilver for local consumption is held at $40@41; powder, No. 2 dynamite, 9½@10c; black, $1.25 per keg. Coal, wholesale: Wellington, $8 perton; Seattle, $6; Bryant, $6; Coos Bay, $5; Wallsend, $7.50; Cumberland, $10.25 in bulk; Pennsylvania Anthracite Egg, $14; Cannel, $10; Rock Springs, Castle Gate and Pleasant Valley, $9; Coke, $12 per ton in bulk and $14 in sacks.

Mining Share Market.

SAN FRANCISCO, May 5, 1898.

War and wheat have drawn speculators and brokers into other channels. The prospective beginning of unwatering the deep Comstock levels through the Yellow Jacket shaft and the favorable official letters justify a firm market. Considerable development work goes on, and the conditions at the mines are not fairly reflected by present street prices. The San Francisco and Pacific board rooms are doing little or no business, some of the old-timers consoling themselves with the reflection that stocks can't go much lower and bring any price at all. To-day's prices were a little firmer, about 2200 shares being sold at the morning session in the San Francisco board room. Supt. Boyle of the Alta mine, who recently inspected the ore development above the Riley tunnel of the Sierra Nevada mine, says there is a breadth of 14 feet exposed in the ore breast that averages $60 per ton, and considers the indications strong for its downward continuance.

Last month the mining and milling companies on and around the Comstock lode paid $57,417 to employes. Detailed disbursements were as follows: Andes, $900; Con. Cal. & Va., $7738; Ophir, $2144; Mexican, $1752; Best & Belcher, $2337; Gould & Curry, $2390; Utah, $840; Occidental, $1800; Alta, $2400; Brunswick lode, shafts Nos. 1 and 2, $6077; Crown Point, $593; Belcher, $2894; Yellow Jacket, $1866; Confidence, $251; Challenge, $251; Imperial, $427; Seg. Belcher, $258; Savage, $2520; Chollar, $1952; Bullion, $424; Potosi, $2430; Union shaft, $2421; Sierra Nevada, $1155; Alpha, $717; Overman, $1000; Caledonia, $500; Nevada mill, $880; water company, $3000; quartz mills, $5000.

Copper stocks make good holdings. J. G. Martin, in his "One Hundred Years' History of the Boston Stock Market," says, regarding the Calumet & Hecla mine: "On Jan. 1, 1868, the stock of both the Calumet and the Hecla was quoted at $30 per share, and this included all the assessments levied—$15 on Calumet and $25 on Hecla. A purchase of 100 shares in either at $30 would have cost $3000, and this since increased to 250 shares is now valued at $530 per share, or $132,500, giving a net profit on stock of $129,500. During this time the dividends paid were $131,250, making the net value in 1898 of original investment $260,750."

San Francisco Stock Board Sales.

Assessment Notices.

RED CAP MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of April, 1898, an assessment (No. 3) of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 125 Beale St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 27th day of June, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. H. MARTIN, Secretary.

Office—125 Beale St., San Francisco, California.

DELINQUENT SALE NOTICE.

TUBER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Panamint District, Inyo County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 22nd day of March, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Zerah Castle	8	6,250	3 125 00
Hugh McDonnell	17	1,000	500 00
Hugh McDonnell	18	1,000	500 00
J. W. Pew, Trustee	74	12,484	6,242 00
Nat Stein, Trustee	75	8,317⅓	4,158 33
Nat Stein, Trustee	76	8,317⅓	4,158 33
Nat Stein, Trustee	77	14,500	7,250 00
W. Sheldon, Trustee	78	12,484	6,242 00
J. W. Pew, Trustee	79	18,733	9,366 50
Nat Stein, Trustee	80	16,749	8,374 50

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of March, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California, on THURSDAY, the 2nd day of June, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

THE HEDGE GOLD EXTRACTOR, for Quartz Mill Work. A machine at last that takes the place of the apron plates in quartz mills, and will make a saving of 10 to 50 per cent over any other process. Simplicity of construction and operation. Large amalgamating surface and a complete and perfect contact. No scouring; no loss of quicksilver. Can easily be kept clean and in order. Durable, practical and economical. Built in three sizes. Price $150, $300, $400. Capacity 4, 10, 20 tons per 24 hours. Weight 175 lbs, 450 lbs, 600 lbs. PACIFIC MINING MACHINERY CO., 127 First St., S. F., Cal.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY. Per G. M. WILDE, Acting Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

AND PACIFIC ELECTRICAL REVIEW.

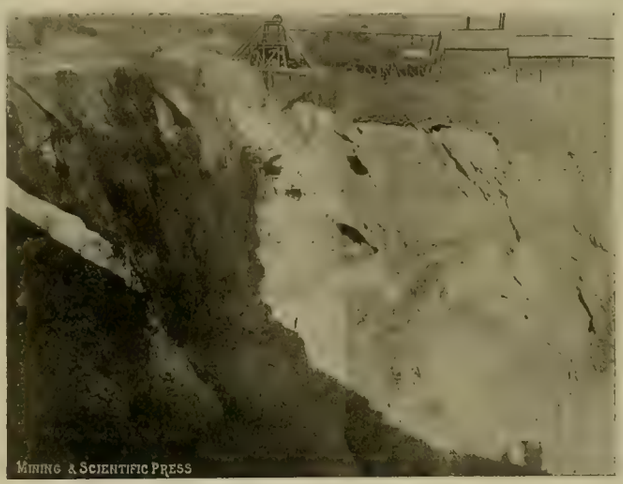
No. 1975.—VOLUME LXXVI. Number 20. SAN FRANCISCO, SATURDAY, MAY 14, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Spenceville, Cal., Copper Mines.

The Spenceville copper mines are 120 miles from San Francisco, 17 miles from Grass Valley, 450 feet above sea level.

In the winter of 1862-3 copper ore was discovered at Spenceville. The region was found to be traversed by copper veins, and on one of these (now the Spenceville mine) a vertical shaft was sunk, reaching a solid body of copper ore. The property came into the possession of the San Francisco Copper Co. about 1875, and was worked by them for thirteen years. A vertical shaft was sunk 180 feet; two crosscuts were run at depths 60 and 100 feet and a level opened at a depth of 150 feet, all in ore. Costly experiments were made. A smelter was erected to refine cement; a flue built of brick and stone 1000 feet in length to carry off sulphur smoke; seventy-five men were employed; the ore taken out of the mine was roasted and leached, and about 46 per cent only of the copper it contained was extracted. The residue accumulated in a dump, which now contains about 150,000 tons. Owing to insufficiency of underground timbering, in August, 1880, the mine caved in, carrying away hoisting works and machinery. This was a heavy loss to the company. Prospecting was never resumed; only the ore in sight was taken out, and the mine was worked as an open cut. In 1890 a large area of ground on the hanging-wall side caved in, forming a pit 200 feet in length, from 30 to 80 feet in width and 80 feet in depth. By this slide were exposed about 2000 tons of good copper ore, and there was also exposed a large vein of iron pyrites 30 feet in thickness. After the cave, peacock or smelting ore from the hanging-wall was taken out, which showed 19 per cent copper.

By the caving in of ground on the hanging-wall side a large body of ore was exposed, but no ore was extracted. Work in summer was confined to hoisting from this pit the water which contains copper, and which has accumulated from the rainfall and the natural flow of water. In the winter the outside of the dump was worked by leaching. There was also manufactured from the tailings of the dump (after all the copper had been extracted) metallic paint.

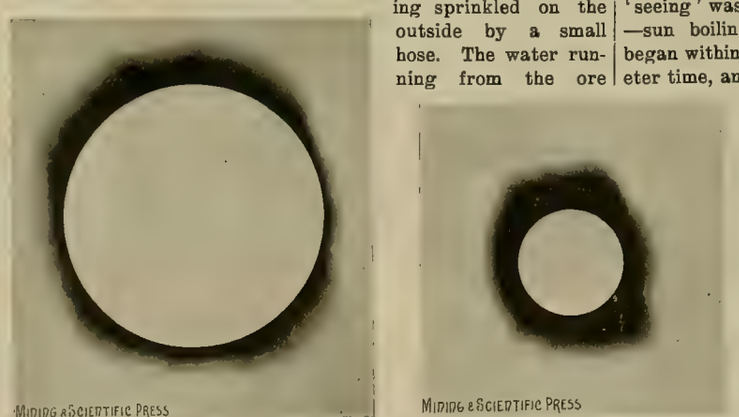


The ore dump is what is left by the old company after leaching the partially roasted ore, 60 per cent only of the copper having been extracted. In length it is about 200 feet, depth from 20 to 80 feet, average width on top 200 feet. It contains about 150,000 tons.

In concluding a report on this property many years ago, Thos. Price of San Francisco said: "There is every indication that the deposit will prove to be a permanent one, and systematic mining may develop seams of rich ore. I assayed a sample from a streak near the hanging-wall shaft that yielded 14 per cent copper; and as early as the year 1863 I purchased considerable ore from this mine that assayed over 20 per cent copper. I have no doubt but that in depth you will again encounter similar bodies. In addition to the copper pyrites, there is a seam of iron pyrites, at least 15 feet in width, that assays from 45 to 48 per cent sulphur. In the future, such material will be worth from $9 to $10 per ton in San Francisco for the manufacture of sulphuric acid. Deposits of copper pyrites containing a less percentage of copper than does your deposit are being worked in other parts of the world at a profit, and I can see no reason why yours could not be worked with a profit."

During the summer the water in the large open cut or pit, which accumulates from the winter rains and the drippings of the ledge, is hoisted by steam in a bucket of a capacity of 200 gallons, and is emptied into two large settling vats or solution reservoirs. The bucket fills and empties itself automatically. From these vats the water runs through a long sluice-box filled with scraps of iron. The copper in the water is precipitated by the iron. The ore dump is worked by the leaching process, water being run onto it, and it being sprinkled on the outside by a small hose. The water running from the ore dump, as a result of this leaching, is a copper solution which is conveyed into the storage vats above mentioned, and thence into the sluice-box, where the copper is precipitated as above described. The copper is cleaned up from the sluice-box occasionally, washed, dried in a drying pan and sacked ready for shipment as copper cement.

After the copper-charged water flows from the vats, the residue of the ore is taken to the paint works, where it is first washed in tanks. It is then air-dried, oxidized in the reverberatory furnace for twelve hours, then milled and placed in barrels ready for shipment.



The copper has sold, delivered on the cars, at from 10 to 12 cents per pound. Such copper cement always commands a ready market, and is shipped as far east as New York. Some years ago there was smelted a quantity of this cement, which produced copper averaging 98 per cent fine, which was used by the Union Iron Works in the construction of the United States ship Charleston. This copper was sold for 17 cents per pound. The copper property comprises ninety acres; its present owners are the Spence Mineral Co., under the management of T. J. Wrampelmeier. At present the ore is being shipped to chemical works at San Francisco—fifteen tons per day—where the pyrites are burned for the manufacture of sulphuric acid. The quantity of acid produced from a ton of the ore is about one and one-third tons. When the better quality of ore is shipped, the copper will be extracted from the residue.

COPPER MINES, SPENCEVILLE, CAL.

The January Eclipse of the Sun.

Our readers will remember that on Jan. 22nd, '98, occurred a total eclipse of the sun, observed under the most favorable conditions at Jeur, India, about 250 miles from Bombay. The leading scientific establishments of the world sent representatives. California sent two fully equipped expeditions. Through the courtesy of Prof. J. M. Schaeberle of the Lick Observatory the MINING AND SCIENTIFIC PRESS is in receipt of the original negatives of two photographic observations taken by Prof. W. W. Campbell, (who had charge of the Lick Observatory Expedition), and which are here reproduced. In a letter from Prof. Campbell, written the day after the eclipse, he says: "There had not been a cloud in the sky for six weeks, and eclipse day was simply beautiful. The 'seeing' was fair that day, though it had been poor—sun boiling—on all previous days. The eclipse began within half a second of my predicted chronometer time, and closed in the same manner. No wind existed, though I was prepared for wind. The corona had great extent, but was faint as a whole. The prominences were numerous, but vastly smaller than in '93. The sky was very bright. Animals paid very little attention to the eclipse. Three miles away, on the horizon formed by a low ridge, I saw the small trees with perfect distinctness during totality. * * * There were eight beautiful negatives with the Dallmeyer and with the Floyd. The spectrum of the sun's edge was fainter than I expected, but the plates are successful and valuable. (It is one of each of the above that is herewith reproduced.) I had a great struggle with the dust and the heat in developing the plates. I had to have the dark room in a tent, temperature 94° Fahr. in the daytime. Had to wait till 1 A. M. to begin developing. And the dust was awful, too. The water was absolutely muddy—had to be boiled and filtered. I never saw such dry climate. Some days the dry bulb was + 32° C., and the wet bulb + 18° C., or even + 17° C. My hands were cracked wide open, and I could scarcely finish the development of the original plates, to say nothing of making copies."

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

Coast Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 520. Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends; Book Notices, 531.

THE Pacific coast has proud part in Dewey's victory in the Philippines. The best of the ships that smashed the Spanish were built in San Francisco and 75 per cent of the men aboard the American ships were from California, Oregon and Nevada.

IT is calculated that since the passage of the Caminetti Act in March, '93, requiring hydraulic miners in this State to build restraining dams for the debris, the total storage capacity of dams and impounding reservoirs so constructed is over 50,000,000 cubic yards.

THE States of Colorado and Utah received an unusual May drenching last week, a good thing for the miners and one in which the California miner would willingly share. The drouth cut short the California gold yield for '97, and will doubtless show a similar shrinkage for '98.

IT is generally stated, though not officially known in this office, that the Commissioner of the General Land Office has made a new ruling requiring $100 worth of work or improvements on each unpatented mining claim for the year in which the entry was made. Heretofore it has been the rule that on a mining claim located say to-day, May 14, '98, the locator had until Dec. 31, '99 to do the amount of work necessary to hold it to that date. If the latest announced ruling be a fact, the $100 would have to be expended thereon by Dec. 31, '98, and $100 for each calendar year thereafter until U. S. patent was secured.

THE U. S. Geological Survey, in accordance with suggestions of California mining engineers, has in the case of Calaveras and Amador counties increased the practical usefulness of the Jackson folio, covering the two counties mentioned, by putting in the Government township projections and inserting therein the surface boundary limits of the various mining claims along the mother lode. This work is about completed, and, it is expected, will be ready for delivery about July 1st, '98. It is understood that State Mineralogist Cooper is having some work done of a similar character in the veins east and west on the mother lode, under the supervision of M. B. Kerr, using the work of the U. S. Geological Survey as a basis, thus completing the work. It is believed that a continuation of such work in all the mineral bearing counties of California would be of immediate and material practical benefit to the miner. Mr. Walcott is in receipt of numerous petitions for surveys from settlers upon lands included in the forest reserves, such survey work having been turned over to his bureau, and desires to reply to all that the subject of surveying such lands will be considered as soon as the bill in which provision is made for such surveys becomes a law.

PRESENT owners of copper mines, producing or giving promise of profitable development, can view the war and industrial situation with complacency. Next to reliable war news nothing is in more active present demand than copper. As with gold and other metals, this west half of America is of prime importance to the nation in this regard. A New York broker says: "During the past three years no shares of any kind of enterprise have shown the remarkable and steady increase in values that the copper shares have. During the past year and a half, eight of the leading copper stocks have increased in value over fifty million dollars and they have increased over twenty million dollars during the past six months. The total par value of their capitalization is only $16,000,000. The Rothschilds and other big capitalists of Europe have agents exploring the entire Western continent for copper properties, and a large number of English bankers and operators have their American correspondents looking up copper mines or large blocks of stocks in such properties for investment purposes. The ownership of all the American copper mines is in the hands of a very few people, and less than 100 American copper mine owners control the world's market for copper. The demand for the metal is greater than the supply, the total visible stock on hand was never so low as now, and would be exhausted entirely in two or three months if the supply was stopped in any way." As things are at present, it looks as though the world needed copper more than gold. It is predicted that copper will sell for 13c before Jan. 1st, '99. It is being produced at a total cost of less than one-half that figure.

TRAVEL to the Klondike, which began last summer, culminated about the 1st of March, '98, and since that date has dropped to one-fourth what it then was. Several transportation companies have lost heavily, and there are now many vessels idly awaiting the rush that was anticipated this spring. The usual exaggerated accounts of rich finds continue to come, but that they are no longer believed is evident. When two or three shipments of gold in any considerable quantity arrive that will doubtless stimulate travel, but the war is the newest sensation and claims the biggest type and greatest prominence in the daily papers. At the Victoria, B. C., custom house the demand for miners' licenses which for awhile averaged 300 per day has fallen off to 25. The letters from those who have had personal knowledge of the hardships and the fatal snowslide at Sheep Camp, beyond Dyea, have almost entirely checked travel via Skaguay or the overland route. It is calculated that there are about 3000 in the vicinity of Copper river, and more than that number still on the way via Skaguay and Dyea. Meanwhile the Yukon route, though longer, gives promise of greater comfort and safety, and it is probable that several thousand will leave Pacific coast ports this summer for the Klondike by way of St. Michaels. The Kotzebue sound country is also attracting attention, and well-equipped vessels are up and loading for that region.

EXISTING CONDITIONS by reason of the prevailing drouth and low water in California make river mining unusually prominent this season. In several instances in northern and central California, where placer mining has been carried on along the banks for years, the bedrock dipping toward the middle of the steam, it has been considered of probable profit to turn the water and work the channel. Wing-damming has been fairly successful; diversion of the waters by tunnel or flume is usually very expensive. Not in the present generation is there a more favorable opportunity than the present for such enterprises, though, as obviously no more than the present can be counted on, enterprises involving large and continuous expenditure will be entered on with caution. The hydraulic gravel elevator has done much to economically aid in this branch of gold mining, and such seasons as the present must result in their increased use. In this regard the same may be said of dredges, which are coming into increased use in California and are winning deserved recognition.

THE Phillippine Islands are good gold producers, and under American control would be an increased factor in the world's annual gold output. The manager of a mining property lying at the east of the China sea, between Borneo and Formosa, said some time ago from Largos: "As a mining country I have never seen its equal; there is gold everywhere. The little streams are full of placer gold and the mountains a perfect network of small ledges, some of them running as much as from four to six ounces per ton; but the people are at least one thousand years behind the times; no work has yet been done here in a systematic manner, and for several reasons it is almost impossible to prospect here. The Government does not give the proper protection to justify any man spending his time prospecting. Another reason is the interior of the islands, which, in my opinion, is the richest portion of them, are peopled with wild tribes of Indians that are almost as ferocious as wild beasts, and no prospecting could be done in their territory unless the prospectors went in large parties; and another reason is that the foliage, which is a regular jungle, is so thick that a man cannot get through it. If any other nation on earth except the Spaniards had this country, it would very soon be the largest gold producing country in the world, but everything is so handicapped that it is impossible to get capital to come in here, and it will take capital to make a success of it. The ore is all high grade, but I am a little afraid it cannot all be successfully worked by the free milling process. I have all the machinery on hand for a 100-stamp mill, and, if it is a success, the company will at once increase their works. They have any amount of ore, and, in this country of cheap labor, they are bound to receive large profits." Now that the United States has acquired that country, it is interesting to note the value of its gold mines and the probability of a new outlet for American enterprise and ingenuity.

INVENTIONS and improvements in mining methods and metallurgical processes are as plenty as ever, only the usual small percentage getting beyond the glowing announcement that the process or discovery is "going to revolutionize" everything in connection therewith. Among the improvements noted this week is that of Supt. Chaumeil of the Compagnie Salines et Mines de l'Altar, in the Altar district, Sonora, Mexico, whose improved dry washer is "working a revolution" in the placer ground of that district. It is locally claimed that the new machine does all the work of a concentrator, "saves all the gold" and "reduces 60 tons of earth to 1," which is interesting. It seems "no gold at all runs off in the tailings. All is saved." In Butte, Montana, Mr. F. Hall has invented a new cyanide process, a prominent part of which is "a secret solution" which has "solved the problem." Mr. Hall says his process "will successfully treat all known refractory ores carrying gold and silver, one or both, including sulphurets, arsenic, antimony, and hard, compact copper ores and iron oxides. I have successfully demonstrated that for acid ores, such as sulphurets, lime is a neutralizer not worthy of recommendation." The further statement by Mr. Hall that Chas. Butters in his cyanide work in Utah, California and South Africa "has failed in every effort he made" will not augment the faith of practical metallurgists in his assertions about anything. The most promising statement of all, however, is contained in the Denver, Colo., *Republican*, which tells of a local genius who is extracting $4 in gold from each ton of coal treated. The technical details of that process would be interesting to metallurgists. If true, this last exceeds in practical interest the evolutions and revolutions of the gentlemen who announce the successful and profitable extraction of gold from sea water. In California it has all along been known that the owner of a coal mine had practically a store of gold, but it is not generally believed that by any process can $4 or any other amount in gold be actually produced from a ton of that valuable vegetable formation.

Sulphur in Demand.

Considerable editorial space has been recently given to the discussion of the production of sulphur. The present war makes the matter one of considerable commercial importance. Thirty days ago New York brimstone was $22 per ton. It is now $50 and upward. It is generally conceded that unless Spain removes the embargo that she has placed on sulphur as contraband of war the manufacturers in this country will raise the price of cheaper kinds of paper. Brimstone is used in large quantities in the manufacture of paper used for newspapers and magazines, and a raise in the price of sulphur would have the effect of raising the cost of production of newspapers to a very appreciable extent. The amount of brimstone in this country at present is small, and there seems at present no indication that the stock can be materially increased. Last year 118,137 tons came to this country from Sicily, and the year before the importation was even larger. The raw brimstone comes almost exclusively from Sicily, most of it being shipped from the port of Palermo. Besides being used by the manufacturers of wood pulp paper, the makers of fertilizers and sulphuric acid are also large consumers of it, while after it has been converted into sulphur it plays an important part in the manufacture of vulcanized rubber, no substitute having yet been found to take the place of sulphur in the making of what is known as hard rubber.

There are sulphur deposits in California, Nevada and elsewhere on this coast. The Humboldt Sulphur Co., of Humboldt, Nevada, is credited with present ability to furnish the local market with sulphur in profitable competition with Sicily or Japan. The Denver Chemical Works report their intention to build a plant for the manufacture of brimstone, from the Vulcan mine in Gunnison county, in which a 4-foot deposit is reported discovered.

In Lower California are also extensive sulphur deposits, which are now being developed. Considerable has been shipped to the refining plant at Ventura, and it is now proposed to establish a refinery at the mines. The surveys on the proposed railroads have been completed to Yuma in one direction, and the engineers are now at work on the coast route.

The McKinley tariff law admitted crude sulphur free, but charged $20 per ton on refined sulphur. In Sicily the sulphur ore as mined contains only about 3 per cent of sulphur. This is refined to about 96 or 97 per cent and is then brought here as crude sulphur and admitted free. The Salt Lake, Utah, *Tribune* editorially says it knows of one bed in Utah where 6,000,000 tons of nearly pure sulphur have been developed and are still there.

In 1896 there were produced in the United States 5260 tons sulphur, valued at $87,200. The estimated consumption of sulphur in the United States for that year was 284,908 tons. During the fiscal year ending July 1, '96, San Francisco imported 6370 tons crude sulphur, or brimstone, valued at $66,934.

DURING the Golden Jubilee Mining Fair in San Francisco last January and February, the writer was asked repeatedly why there was not one exhibit where the whole process of quartz mining and metallurgy could be shown from where men would be employed taking out the ore, to where the bar of gold bullion was on exhibition. The most obvious reason was on account of the necessary hurry by reason of the very short time, the wonder being that so much was done in so short a time. The matter is referred to here in connection with the fact that in accordance with similar suggestion the managers of the International Mining Congress which meets at Salt Lake City, Utah, next July, are now installing a working demonstration of the cyanide process, complete, from mining the ore to exhibition of the bullion therefrom. The idea is an excellent one. While many of the visitors and delegates know considerable about it, yet to a very large proportion the exhibit will be interesting and of value as a practical educator. It is sometimes difficult for practical mining men to realize that thousands are yearly engaging in mining who are unacquainted with the rudiments of many things that they know little about, but who are eager to learn. Recently an old experienced California hydraulic miner made joking reference to some "kindergarten" information herein about flumes and ditches. But while to him such information was unnecessary, and doubtless did seem so, yet among the hundreds of new subscribers monthly added to our lists just such information is eagerly sought. The law of supply and demand illustrates this. A very large proportion of the daily mail received in the business office of this journal is requests for back numbers of recent issues containing information on some subject that, while it may be thoroughly known and understood by many miners, is as new and important to others as it was to the first class when they first learned it. The managers of the Utah meeting have the right idea and deserve commendation for putting it into execution.

Some Questions Answered.

A Coulterville, Cal., subscriber asks "on how short a curve 16-foot lumber can be successfully floated in a V flume carrying 300 miners' inches of water, fall ½ inch to the rod? And on how short a curve if the V flume carried 500 miners' inches of water?"

The question was referred to two leading mechanical and hydraulic engineers, who reply: "As no dimensions of either flume or lumber are given, we have assumed lumber to be 2x12 inches, 16 feet long. This can be floated in a V-shaped flume carrying 300 miners' inches and having a radius of 60 feet to center of flume. If your correspondent will state what size of lumber is to be floated and shape and size (also whether 90° or not) of flume, together with quantity of water, we can tell you exactly curve or radius of flume required."

A Grants Pass, Oregon, assayer sends a half-ounce button of what he styles sulphuret of molybdenum and wants it tested.

In open glass tube the sample gave sulphurous fumes and a pale yellow sublimate. In pincette before blowpipe it imparted a yellow-green color to flame. On charcoal with oxidation flame it yielded circular crystals and white coating, which changes to azure blue with an intermittent reduction flame.

Molybdenite is soluble in nitro-hydrochloric acid, imparting green color to liquid. Evaporate excess of acid, dilute with water and introduce hydrogen sulphide. A blue coloration is produced and a gradually formed precipitate of brownish-black molybdic sulphide. Collect this on filter, dry and place in an uncovered, oblique-inclined crucible over a gently heating flame, where it remains until sulphurous anhydride fumes entirely cease; the yellow residue is dissolved in ammonium hydroxide. Hydrochloric acid added precipitates white molybdic acid, which is again soluble in excess of same acid. Stannous acid added to the hydrochloric solution of molybdic acid gives a blue coloration, changing to green and finally brown.

The ignition of ammonium molybdate produces a gray oxide, which, mixed with sugar and heated in an electric furnace with a current of 350 amperes and 70 volts for eight minutes, produces a button of cast metal. M. Moissan—*Comptes Rendus*, p. 1320, vol. 120—cites the reduction in an electrical furnace of a mixture of MO_2 and charcoal and describes a reaction of fused molybdenum. When nearly pure molybdenum has a density of about 9, is practically as malleable as iron, can be filed and forged when hot. It is believed to be of definite commercial value, and its occurrence in sufficient quantities to justify reduction would doubtless be of financial profit.

M. Moissan (to whose experiments we are indebted for almost all our knowledge of the subject) says that the most remarkable property of the metal is that it can be cemented like wrought iron, forming a "steel," if the term may be used, which can be tempered similarly to iron steel. Having an affinity for oxygen, it is suggested that it may be added to the iron in a converter, replacing manganese or aluminum.

An unusual question comes from an Idaho reader who wants to know how daily newspapers can "copyright" their daily issues. He says if he wants to "copyright" anything it takes a month to get the copyright from Washington. The morning dailies that copyright their several editions do so for a year ahead. On the first day of January of each year they file two copies of the heading of the paper bearing the date of each day in advance, just as if they had been torn from papers already published. This copyrights each issue when published. When this is done, a deposit of several hundred dollars is made, to be used as the days go by. These moneys are called trust funds. They are held by the Register of the Treasury.

The question as to the minimum amount of water required for stamp mills is one that suggests only a general answer, as conditions vary. In the excellent treatise on gold milling, recently published herein, E. B. Preston, on this subject, says:

The amount of water required for the proper working of the battery depends on the nature of the ore; clayey ores, or such as have a high percentage of sulphurets, requiring the most; but while in the former case a greater amount is needed inside the mortar, the latter condition permits a part being added outside the screen, on the lip of the mortar. A small sluice-box, with plug holes, is placed across the front in this case, or the water is conveyed by means of a half-inch perforated iron pipe, attached to the vertical supply pipe by an elbow joint, permitting it to be turned either way as required. The amount of water used per ton of ore stamped varies from 1000 to 2400 gallons with a mean amount of about 1800 gallons per ton of rock crushed. Most of the mills in actual practice figure roughly on one miner's inch of water, more or less, per twenty-four hours for each battery of five stamps. To obtain the largest amount of crushing of clean quartz from a battery, only sufficient water should be used inside to keep up the regular, even swash of the pulp, and if that be not sufficient to keep the plates on the outside clear from accumulating pulp, more may be added outside the screen. The pulp, in passing down over the apron plate, should roll in successive waves, corresponding to the back-and-forth wave motion inside the battery, rather than flow in an even sheet, as affording a better opportunity of contact for the particles of amalgam. Where the temperature falls low in winter, arrangements should be made to deliver the water in a tepid condition, as better amalgamating results will be obtained, through keeping the quicksilver in a lively condition. Where steam power is used, this can be easily arranged; but when using water power, a separate heater is required.

In "rawhiding" ore in British Columbia cowhides are used just as taken from the carcass; inch holes are cut one foot apart around the edges, the hide laid flat and the ore piled in sacks thereon; the ends and sides are drawn together by a rope passed through the holes, the neck in front and fastened to a singletree. A mule is the motive power, and fast time is made down the trail, a rough lock, consisting of a log chain, being used in steep places.

Platinum in the United States is almost entirely a California product; the principal platinum-producing section of California is in the northern part—about the Klamath river and its tributaries. It is also found on and near the great serpentine belt traversing Sierra and Plumas counties. In stream sands it occurs nearly always in small worn grains and scales; occasionally in globular particles of varying purity and color. It is usually associated with iridium and osmium.

SO FAR AS HEARD FROM, the bill which recently passed the United States Senate suspending the operation of the annual assessment law on unpatented mining claims as to men enlisting in the U. S. army has not passed the House, though it promptly should. In the war of '61–'65 such a provision was in force. Miners and prospectors are enlisting, and should be granted this extension. The law was made for times of peace and should be temporarily abrogated. It ought to be only necessary for any miner or prospector to file an affidavit of his enlistment that during his term of service no assessment work be required on his claim. The miners are prompt to enlist and make valuable soldiers.

A NEW STRIKE of exceeding richness is reported at the Keystone mine, Amador Co., Cal. Apart from the usual newspaper exaggeration regarding values and extent, it may be conservatively stated that the recent offer of the mine for $250,000 has been withdrawn, and that there is sufficient low grade ore to keep the mill in constant profitable operation for an indefinite period. As a rule, the biggest money in mining is made from "low grade" ore, where it exists in large quantities and can be mined and treated cheaply. Some of the most profitable mines in the United States are producing their dividends from ore containing less than $4 to the ton. The old Keystone is one of California's stand-bys. It has yielded over $12,000,000.

Sierra Buttes Gold Mining Co.

On April 21st, in London, a meeting of the above company was held; Chairman Tendron said: The Buttes mine, in the experience of the predecessors of the company, was, no doubt, one of the earliest pioneers of quartz mining in California. The early days of the company were very prosperous, and during its existence the shareholders have had dividends amounting to $1,704,765. But in 1890, when the deepest tunnel, about half a mile on the dip of the vein, had been completed, and rises made from that tunnel to the eighth tunnel—three rises of 175 feet were made, and yet pay ore could not be found. I do not suppose that we made a profit of $50,000 out of all that work between the No. 9 and the No. 8 tunnels. In 1890 we decided to cease all work in the lower part of the Buttes mine if the decision that had been come to by the Board—that we would not work at a loss—was to be carried out. But we decided that the mill on the higher ground should be renewed, and that we should work up the dumps and see if we could find some bodies of ore, which though poor and not considered good enough to be worked by the first proprietors, might yet be made to pay, having regard to the very economical regime that the mine was then placed under. Well, that policy was successful. We did not make large profits, but we at all events recouped the whole cost of the mill, and the cost of repairing the flumes, and we paid all our expenses and made a little money. Last year there were indications of a possible slide that would carry away the mill; and, therefore, the question arose whether we would put up another mill, and do the work necessary for bringing the ore from these old workings to the new mill. The cost was to be $10,000, and we thought we would run that risk.

The mill has been finished and the tramway made. Mr. Johns was at the Buttes mine the beginning of the month, and says that he has made a careful examination of the new mill and tramway, and also of the mine, and finds that the mill is well and strongly built and the tramway working satisfactorily. He also says that a raise has been put up from the No. 3 level to the No. 2, which has been opened 275 feet and connected with the No. 2 of the Independence mine, and there is a considerable quantity of quartz exposed, some of it looking well and some very poor. It cannot, however, be very well selected; it must be taken as it stands, as there is gold in the whole of it, and it must all, or nearly all, pass through the mill. He cannot say anything positive, nor can we. The working of the new mill for the first month met all expenses; strange to say, the expenditure and the cost came to within $1 of each other. In the telegram received from Mr. Johns, April 20th, he says he will do better this month as far as the mill is concerned.

Now we come to the Eureka, and there our experience is almost the same. For a few years after the company was formed, in 1872, the working was not satisfactory; but, after that, it became a prosperous mine and the shareholders have had dividends amounting to $2,583,965. Like the Buttes, however, the vein, although fairly strong, diminished in auriferous properties in depth; and had it not been for a flat vein that was cut in the Eureka tunnel, we should hardly have any profit at all out of driving that very long tunnel. The flat vein was just cut in the roof; a few feet lower down would have missed it. It proved very profitable. The extraordinary thing in connection with the Eureka is that, in addition to the vein proper, there are no less than four flat veins, almost like coal seams, on that property. Flat veins are not satisfactory working; they are more expensive, and generally narrower, and more subject to vicissitudes. They are narrower in places and much wider in other places than ordinary vertical veins, or veins that are nearly vertical. And these flat veins are exhaustive to work. They have been thoroughly explored, and I do not think it is of any use to carry the explorations any further. Mr. Johns would like to spend a little more money on the flat veins in the Eureka property, but I strongly object to it. He understands that anything I say to you to-day is to go to him as an order, and I object to any money being further expended at the Eureka mine. I wish the stores and materials realized, and the place closed, and whatever can be got for it to be got. The Eureka has a certain amount of funds, which I will refer to later on, and I am not at all disposed to see that amount diminished. The usual course in dealing with a mining property is to go on until you have spent every shilling and you are more or less in debt, then to reconstruct, and afterwards to raise money on preference shares or bonds, and somehow to go on until there is a second reconstruction, and, as long as it is possible, to get money out of the shareholders' pockets. We have no idea of working upon those lines. So long as they can work abroad so as to cover their expenditure and the expenses here, so long shall I recommend the shareholders to have patience. And you have every reason to have patience, because one of the directors is the holder of $1,000,000 in the two companies, and any division of assets would put a good many thousands of pounds into his pockets. It is only the Eureka that has money. You may be sure that if he approves the policy that is being carried out, it is the policy that is best in the interests of the shareholders. Now, of those dividends to which I have referred, amounting to $4,288,730, $315,615 came from the Uncle Sam. That mine was bought in 1889 at a cost of $160,000. There is a considerable amount of stores and materials there, but I do not think the figure correct. I do not think these stores will realize half the amount they stand at. Instead of being $8500, I shall be very well satisfied if we can get $5000 for them. These stores must be realized and that mine must be disposed of if Mr. Johns can find a buyer. So long, however, as the men are willing to work on tribute, we shall be willing to allow them do so; but there must be no more work at Uncle Sam on our account, and the moment the men cease working during the summer, whatever stores and materials cannot be sold must be sent to the Whitlock.

Now we come to the later mines, and I shall refer in the first place to the Mammoth. It was bought in 1894 at a lower figure, perhaps, than any mine has ever been purchased by the British public—namely, $25,000. But yet that wretched mine has cost us in development and surface work up to the present time over $100,000. Mr. Johns has written me a long letter in which he says: "The best mines in Tuolumne county are found in the hanging-wall country of the mother vein, and if the directors desire to have the Orcutt (which is a continuation of the Mammoth) prospected, I would suggest the sinking of a shaft 400 or 500 feet deep a little to the eastward of the mother vein, and crosscutting both eastward and westward of it, and thoroughly prospecting to that depth. From the developments already made in the Mammoth, I have little or no hope that better results will be obtained by continuing the work. If the directors should decide to prospect the Orcutt, they must expect to spend from $25,000 to $30,000 in doing so." I never knew anyone's estimate to come out at more than the actual expenditure. Therefore, to that we give an emphatic "No." There shall be no more money spent at the Mammoth. If Mr. Johns can find American gentlemen—and there are plenty of them with any amount of money in San Francisco—who are willing to do the prospecting, and, after paying the expenses of working, will be content to keep one-half of the net profits for themselves and give us the other half, we shall be very glad indeed; but, so far as we are concerned, no money goes from this side, and we will have no debt incurred. I hope that is perfectly plain-speaking, which will be intelligible to Mr. Johns, and that he will regard it as an instruction and act accordingly.

Now we come to the one mine that alone stops the company from being wound up, and that is the Whitlock. That, too, was bought in 1894. It was bought cheaply; but, like any other mine, cost a considerable sum for development and surface work, until it figures in the balance sheet at $203,970. Well, that mine bears all its development now, and has done so for some time, and it makes a profit. So long as it makes a profit sufficient to pay all the expenses out there, and the London expenses also, so long will we go on with the Whitlock. The telegram received as to the present state of things is quite as satisfactory as I expected, but this is not saying much. The ledge is now reached in the fifth level, and has been driven along for 105 feet. It averages 5 feet in width of $6 ore, and it continues ahead. There is no sign at present of its discontinuing. The flat vein that is also met with in the Whitlock, called the mill vein, is continuing, and is worth about $7. For the moment it is very narrow, only 1 foot wide; a short time ago it was 2 feet wide, and before that 3 feet wide. It will probably widen again; at any rate, we hope so. The branch vein that had broken and pinched a short time ago, going towards the surface, is making again; it is 3 feet wide, and worth $7 per ton. You will have noticed that during January, February and March we were making a fair profit—or, at least, sufficient for our requirements. I can hardly call it a "fair profit," for we are greatly disappointed there in the quality of the ore. If the ore had been what it was reported to be during the time when we bonded and worked on the mine—$8 to $12—we would have been making very good profits now.

Now what is the present position of the Eureka?—for, after all, the Eureka is the only monied partner at the moment. The Eureka has investments that would realize, even in the present depressed state of things, a profit of nearly $10,000—in other words, investments which would realize about $70,000. We have cash in London and in California amounting to $28,000, after paying off all our creditors; and the stores and materials, that stand in the balance sheet at a little over $30,000, can very well be put down at $22,000. So the Eureka shareholders, if the company were wound up, would have about $120,000 to divide, less the liquidation expenses, which would not be very heavy. We hope that, if we continue our operations, the cash assets will be a little more than $200,000, because the Eureka has advanced the Buttes between $15,000 and $20,000 in connection with the purchase of these new properties. The Eureka has paid more than its moiety, and the Buttes could not pay its moiety if it were pressed to do so by about $25,000 or $26,000; so that any profit made by the Buttes, and any moiety of profit made at the Whitlock, will go to the Eureka until the Buttes account is squared up. This is not a lively state of things. I think one of the mining papers said three or four years ago that I was a sort of prophet, always preaching in the wilderness and crying out for the death of these companies. Certainly you must admit that the Old Eureka and Butte mines have been a long time dying, and they are not dead yet. You have only the choice of two policies—either to wind up at once, or go on a little longer in your own interests, as well as in the interest of others. Between now and next winter we shall know a little more clearly how we stand—whether Mr. Johns has been able to do anything with the other mines, whether the Buttes is earning a little, and what prospects there are at the Whitlock.

The report and accounts were adopted.

Mine Development in Nevada.

J. D. PINDER, M. E.

Those who have made intelligent observation of the possible mineral production of Nevada cannot doubt that great wealth and prosperity will some day attend the efforts of legitimate enterprise in the proper development of the numerous and promising deposits known to exist within the State.

That Nevada is dilatory in this particular cannot be denied. Almost everyone has claims, more or less, but few possess the means with which to develop them. And there seems to be little real interest manifested in procuring the necessary assistance of those who have such means. But there is one feature connected with the mining industry which is apparently but little understood, and that is the matter of mine development, or the lack of mine development.

There are almost as many prospects as there are claims; and there is one very prominent idea in the minds of prospecting miners, and that is, if they have a 50-foot shaft or a 100-foot tunnel on a lode, they have a mine. But where one good prospect has these there are a hundred of less development. If the people of the mining districts doubt this assertion let them cast their eyes over the mining fields of their own section and figure on the developed and undeveloped lodes, and they may realize what they have within their grasp in the way of golden wealth with no one grasping for it. And why? I will answer: Because the amount of develment does not justify the thousands of dollars generally asked for the property. In these latter days of greater experience there must be something to show for the demand, and it must be so developed that it may be estimated by measurement, as to width, depth, length, quantity and value per assays, less the probable cost of mining and reduction; and on this showing it is very safe to determine whether the demand is in excess of the estimated value. There are may other points to be taken into consideration when purchasers estimate values, where a question of hard cash is concerned, that have been taught by long experience. And here let me say: The period when holes in the ground have a value is passed; there must be developed merit for coin.

The markets are flooded with so-called "mines," and when an offer is critically investigated even in the city before the property itself is examined it too often falls short. And if the "prospect" does present acceptable features and enough to induce the expenditure of time and money to examine the property, in nine cases out of ten, there is something to be discounted:

At the present time there is an active demand for good developed properties, and I will say right here that it is less trouble to sell a fairly developed property than it is to find one. I know of five requests in one day, recently, from English and American capital, all wanting well developed, active producing properties, not so much the of production bullion as of ores, as a guarantee for a milling or smelting proposition—with sufficient development upon which some safe computation as to value could be made to justify the price asked. It is a fact that it is almost impossible to meet such demands.

A prospect having a shaft 50 feet deep and a drift 50 feet on the lode having a "nominal" value of say $10,000 would hardly be looked at by capital; while the same property having a shaft 300 feet deep and 300 feet drift on the lode, would readily command a price of at least $300,000, with say $6,000 to $8,000 for development of five or six months' work. This is an example of the profits of development.

A CERTAIN Kalgoorlie mine manager had a mine under his control which held out good prospects if opened at a depth. He asked his London board for a winding engine, and immediately a 10-stamp battery was forwarded to him. As there was no payable lode proved on the mine the stamps were useless, and for a year or so lay in Coolgardie in the original packages. Now, however, those same stamps are likely soon to be doing good, as they have been purchased by another company, and form a portion of the largest battery on the Kalgoorlie field.—Kalgoorlie, Australia, Standard.

Speed Government in Water-Power Plants.*

NUMBER I.

MARK A. REPLOGLE.

No problem in hydrodynamics has created so much interest in the past few years as the government of water powers. When it has been demonstrated that power could be successfully transmitted to great distances by the use of electric currents, the economist very naturally conceived the idea of harnessing available waterfalls. It was well known that turbine water wheels could be constructed that would furnish to a dynamo an efficiency of 75 per cent, or more, of the energy represented by the fall or head. The conservative engineer and the investor, however, were much concerned about the possibilities of regulation or government, and much diversity of opinion has been expressed by thoughtful and earnest engineers regarding it. Specialists have spent much labor in experimenting and developing apparatus to govern power plants. It has been demonstrated that water-power plants can be successfully governed. But the various degrees of regulation, ranging from indifferent speeds up to good engine practice, even with the same apparatus when used in different water-powers, prove that there are some underlying principles that must be adhered to if successful regulation is to be obtained by calculation or intelligent reasoning, and it is for the purpose of discussing some of these principles that this paper has been prepared.

Very little literature can be found that treats on the government of water powers in a scientific manner, and what is extant shows that the German, Swiss and French engineers had spent much thought and labor on this subject years before the problem became an important one in America. Space forbids any comments on their experiments or practice, except to say that, until within a very few years, they were far in advance of our own hydraulic engineers in this particular part of power-plant construction.

Regarding the early work in this line, nothing better can be said than to quote the "Encyclopædia Britannica," which says: "The science of hydrodynamics was cultivated with less success among the ancients than any other branch of mechanical philosophy. If we except a few propositions on the pressure and equilibrium of liquids, hydrodynamics must be regarded as a modern science which owes its existence and improvement to those great men who adorned the seventeenth and eighteenth centuries." During the early part of the nineteenth century rapid advances were made by Europeans in methods of getting power from gravity by the use of the agent water. The interest awakened by the success attained, as well as the necessity of good government in localities where steam power was expensive, no doubt had much to do toward an early development of governing apparatus in the European counties. In America, steam power has been so cheap as almost to supersede water power in some localities, and where steady power was a necessity it was almost invariably furnished by steam engines, water power being used only where little or no government was required. Hence the American manufacturer was fairly satisfied with a device that would slowly move his wheel gates when too great a change was perceptible in the speed of his plant. Such device was called a governor until the electrical engineer of recent years discovered that his machinery was safer if he ignored entirely the so-called water-wheel governor.

The late successes in long distance transmission make water powers more valuable than they have been considered in the past, and the demands for reliable speed regulation are so urgent that there is a decided tendency on the part of engineers and investors to study the proposition more from a scientific point of view, laying bare, if possible, the principles that underlie it. These principles then may be used for foundations from which to reason out a solution of the problem. The doubts concerning the satisfactory government of water power have often caused capital to be withheld where it otherwise might be earning handsome dividends. It is very apparent that speed government in water powers should be reduced to an exact science, if possible, and it is hoped that this paper will exert some bearing to that end.

The following preliminary view of the proposition will disclose some of the difficulties that do not appear at first thought: First to be considered is the water. It is an inert material, incompressible, and having inertia, hence momentum when in motion. It contains no power whatever except that generated by gravity in giving it motion. Perhaps no better demonstration of the evil effects of inertia and momentum in governing can be given than the experience at the power plant of the Fresno transmission. (Plate 1.)

A feeder pipe about 3800 feet long is used to carry the water from *A*, the outlet of a reservoir on a mountain top, to *D*, the power house on the San Joaquin river. The fall or head in this case is 1410 feet, and the pipe is amply heavy for all the ordinary strains that come in the manipulation of the power. Before the plant was ready for actual operation, through some accident, a valve at *D* was opened, allowing a 4-inch stream of water to escape; the pressure gauge, which ordinarily showed 610 pounds to the square inch, dropped to 350. The valve at *D* was almost immediately closed by the attendant when the pressure-gauge pointer ran up to its limit, 1000 pounds to the square inch. Immediately following this was a great writhing in the pipe line, ending in a report at *C* about 700 feet vertically above the power house. The pressure gauge dropped to about 300, and the flood of water coming down the mountain side indicated that the pipe had burst at *C*. Further investigation showed that the pipe from *A* to *B* had collapsed or flattened. The logical conclusion is, that when the valve was opened at *D* the portion of the water column from *B* to *D* began moving. That portion of the column from *A* to *B* lying in an almost horizontal plane did not have its inertia overcome quickly enough to follow, hence the column separated at *B*, causing a vacuum from *B* to *C*. When the valve at *D* was closed the water from *D* to *C* came to a standstill, raising the pressure by its momentum to 1,000 pounds per square inch, showing proof that the engineers had calculated correctly. By the time that the valve was closed at *D* the column *A B* had been acted upon by gravity for some seconds, thereby giving it time to acquire considerable velocity, hence momentum; therefore, when it reached the other column at *C* the concussion burst the pipe, showing at one bold stroke the effect of incompressibility and momentum. The collapse in the pipe from *A* to *B* was due of course to the water emptying faster at *C* than it could at *A* (the pipe line here being of much lighter steel).

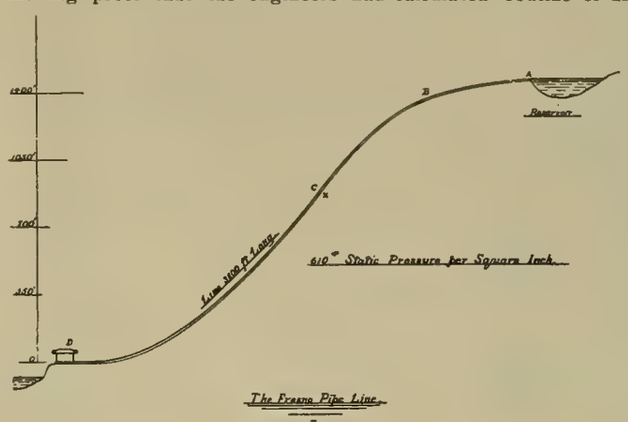

PLATE 1.

It can readily be seen that if government in this plant were attempted by changing the flow in the pipe line, as is ordinarily done, it would have been an impossibility if the safety of the installation was a consideration. Hence the governing is done by shifting a stream of water on or off the wheel as the power demands require.

It might be added incidentally that the stream from a nozzle 1⅝ inches in diameter furnishes about 500 H. P., also that said stream can very quickly bore a hole through a granite rock or even a steel plate. It requires much care and ingenuity to handle this power plant, but it has been in actual operation for nearly two years, and is an unqualified success.

The inference to be drawn from the above experience is, that these evil effects appear in every power plant in a corresponding ratio to the length of pipes or closed flumes used to carry water to the wheels. The injurious effect on government is to change momentarily the pressure or head on the wheel when any movement of the wheel gate is made. The effect is always the opposite from that required to keep even speed. Hence there is a limit to the time allowable in the gate movement.

(To be Continued.)

*Journal of the Franklin Institute.

The Use of Lime for Cleaning Slimes.

In the treatment of slimes on the Rand field it was discovered, early in the course of experiments, that the clarifying properties of lime were not due intrinsically to its alkalinity—though that is in itself of distinct value in another direction, for caustic soda amongst other alkalies has but little effect, whilst some acids and salts produce marked results. It was W. Bettel who first associated this property with the phenomenon known as surface tension. The study which the importance of this property has tempted chemists into has led to the unearthing of a report by two German chemists, Messrs. R. Sachse and A. Becker. This report relates to the use of lime in agriculture, and is preserved in the Landw. Vers. Stat. 43, 1893, Nos. 1 and 2, fol. 15–25. The investigation dealt with the use of lime and various other reagents for the flocculation, or curdling, and for the precipitation from water, of the suspended, finely divided quartz and clay, together with the acceleration induced by lime of filtration, through soils. The authors conclude that the action of lime in this connection is not chemical, but due probably to the obscure physical laws governing such phenomena as those of surface tension. Lime, carbon-dioxide, hydrochloric acid and monocalcium phosphate were found to be the most efficient; sulphuric acid, nitric acid, potassic chloride, ammonic chloride and sodic chloride produced a similar though less marked effect; calcic, magnesic and ammonic sulphates were not very effective; potassic dihydric phosphate (KH_2PO_4) gave negative results, whilst sodic nitrate actually reversed the curdling action. Many other soluble noncollodial bodies were proved to accelerate settlement and filtration, as, for instance, potassium cyanide, as well as the soluble iron and alumina sulphates contained in a mill pulp water itself.—S. A. Mining Journal.

Opinions.

By H. H. KELLEY, in *Scientific Machinist*.

Have you ever enjoyed an evening in company with practical engineers during a discussion of the various items of interest which occasionally drop into the routine of an engineer's life? These items are of value and serve to break the monotony of what would otherwise be an uneventful existence. Those who are members of some engineers' association undoubtedly have, and such experiences carry much of interest and helpful information to the engineer, although the result of opinions expressed under these circumstances is not likely to prove such as would warrant much thought, nor a careful consideration of the details in each case being given. After enjoying such an exchange of ideas and opinions—perhaps many times—and when accuracy is at rather a low ebb, we are very apt to use the same freedom when giving our opinions in cases where the outcome may mean a saving or loss expressed in dollars and cents. Nor is this to be wondered at, for no doubt in many instances we will have had our opinions apparently substantiated in finding several others who held similar views upon the same subject, and, therefore, almost unconsciously conclude that our ideas are about right. Several years ago, when in company with perhaps a dozen engineers, the subject of heating surface in a boiler was brought up, and this led to an interesting discussion of a subject which seems to be ever open to differences of opinion.

During the conversation one engineer stated that he never allowed less than 15 square feet of water heating surface per H. P. of an engine, and would never recommend a boiler, for any engine, that did not contain this amount.

Another engineer said that was useless, as there was no need of so liberal an allowance being made. In his experience he had found 12 square feet to be ample, and a boiler containing this allowance per H. P. would, in his opinion, run any engine. Another stated that during about fifteen years' experience with boilers he had found them to work very satisfactorily with an allowance of only 10 square feet per H. P. Few agreed with this gentleman, and still fewer with the next gentleman, who said he was running a plant in which the allowance was only 8 square feet per H. P. of engine, and with good coal he had no difficulty in keeping up steam. Matters began to grow warm about this time, but no one seemed inclined to dispute the other, as all were about equally well versed in the matter, having formed their opinions from actual experience in the boiler room. However, it does seem almost improbable, at first thought, that these opinions, differing so widely as they do, could be founded upon actual experience. Let us look at this matter from the engine side of the story, and perhaps the cause of these seeming improbabilities may be discovered. Let us take, for illustration, four engines representing four different kinds, or makes, and each engine is developing 100 H. P. We will assume that, owing to the difference in design of engines, valves and valve-gears, the weight of steam, or water required, from and at 212°, per H. P. per hour is as follows: First engine, 20 pounds; second engine, 25 pounds; third engine, 30 pounds; and the fourth engine, 37.5 pounds. Now, in this case the boiler is proportioned so as to evaporate 2.5 pounds of water, from and at 212°, per square foot of heating surface per hour.

The heating surface in each case, or rather the allowance required per H. P. of engine, may be obtained by dividing the weight of water required by the engine per H. P. per hour by the weight of water evaporated per square foot of heating surface per hour by the boiler. While the H. P. developed by the engines, and also the weight of water evaporated per square foot of heating surface, are the same in each case, yet we find that the allowance of heating surface per H. P. of engine varies considerably, as follows: First engine, 8 square feet; second engine, 10 square feet; third engine, 12 square feet; and the fourth engine, 15 square feet. From this we

see that the gentlemen referred to above, while making some very curious remarks, were, or might have been, correct in each case.

The chances are that no two men were running the same kind of engine. A few minutes later the "12 square foot" gentleman related his experience with a mill owner who had a horizontal tubular boiler containing 900 square feet of heating surface and 22.5 square feet of grate surface. This boiler was supplying steam to a side-valve engine developing, on the average, 75 H. P., but occasionally the load was increased to such an extent that the engine, which was already working beyond its rated power, was found to be too small. The boiler being in good condition the mill owner thought he would try and run an engine of 100 H. P. with the same boiler. It came to pass that he met our "12 square foot" gentleman and asked his opinion with reference to the proposed change. The latter, after a little figuring, replied that he thought it a very poor thing to do, for 900 square feet of heating surface divided by 12 (his invariable rule) equals only 75 H. P.; therefore the mill owner would be trying to run a 100 H. P. engine with a 75 H. P. boiler, which would be very uneconomical indeed.

The mill owner was not entirely satisfied with this bit of information and so referred the matter to Mr. Blank, another engineer in the same town, who in a day or two reported that, if the mill owner would purchase a certain make of engine he thought the mill could be run with the same weight of coal as in the case of the smaller engine. It may be of interest to see how Mr. Blank arrived at a conclusion so different from the "12 square foot" gentleman. As stated above, the boiler contained 900 square feet of heating surface and 22.5 square feet of grate surface, which gives a surface ratio of 40.

According to a formula from a well-known author, the evaporating capacity of this boiler expressed in pounds of water from and at 212° per hour, and when consuming sixteen pounds of coal per square foot of grate per hour, is 4240.8 per hour.

The H. P. of the new engine, as stated above, was to be 100; therefore, if the engine was to require steam as fast as the boiler could generate it with above weight of coal per square foot of grate per hour, the water consumption per H. P. per hour would be 42.408 pounds from and at 212° Fahr.

Now, it would not be a very difficult matter to find an engine of 100 H. P. having the above water rate; therefore, if the mill owner had acted upon the opinion of our "12 foot square gentleman," he would either have continued to run his mill at a loss or would have purchased a new boiler in addition to the larger engine, which would have been another large item of expense, and, in this case, entirely unnecessary.

Although the above may have been what is commonly called a "thank you" job, the fact remains that any engineer who takes pains to have his opinions correct, and therefore reliable, is at least gaining the confidence of those who seek his judgment, not only in matters mechanical, but other things as well, and the confidence thus gained will sooner or later pay the engineer handsomely for his labor when his opinion may again be asked.

It is not an infrequent occurrence nowadays, when a new boiler is needed, to have the firm refer the matter to the engineer for his opinion with reference to the capacity, design, pressure to be carried, etc. It is certainly a pleasure to note that such actions on the part of firms and proprietors of establishments are increasing in number every year. No doubt these men are beginning to appreciate the fact that engineers have risen rapidly in their profession from the position occupied but a few years ago. Engineers read more, study more, think more accurately, and, therefore, are more intelligent and skillful; and when an engineer expresses his opinion nowadays it has greater influence upon the person seeking it than formerly. When bids for the new boiler have been received, they are very often referred to the engineer before an acceptance is granted and a contract for the delivery of the boiler entered into.

This is particularly the case when it is not quite clear to those in the office which of the bids could be profitably accepted. This offers the engineer an opportunity of making his opinion of value to those employing him, and establishing his reputation in their minds as a man who understands his business. To illustrate a point in a simple manner, where those who are not familiar with steam machinery would be very likely to go astray in a case as cited above, we will suppose that two bids have been received for a boiler which is to contain 1040 square feet of heating surface.

The first bid offers a boiler 64″ x 16 feet, with fifty-four 4″ tubes and contains 1040.88 square feet. Price, $900. The second bid offers a boiler 64″ x 16 feet, with seventy-four 3″ tubes, and containing 1037.64 square feet. Price, $915. The engineer looks at the figures representing heating surface and then at the price.

He finds a difference of only 3.24 square feet of surface, and a difference of $15 in the price, and, were he not a careful man, in such cases he would conclude at once that the first bid was by all means the lower, and would therefore recommend its acceptance. Boiler makers do not always compute the heating surfaces in boilers by the same method, or upon the same basis of measurements; therefore, our thoughtful engineer knows that there is an opportunity here for the consideration of the big, little "if," namely, if the heating surfaces in these boilers were computed from similar measurements, then the first bid would be the lower; but, if not, then the second bid might prove preferable. To satisfy himself upon this point, the engineer first computes the heating surface in the boiler first named, using outside dimensions, and he finds the number of feet to be the same as that stated in the bid. Then he computes the surface in the second boiler, using outside dimensions also, and finds the heating surface to be 1102.76 square feet, and, dividing the number of feet of surface in each boiler by 12, he obtains 86.74 H. P. for the first boiler and 91.89 for the second—the cost per H. P. being, respectively, $10.37 and $9.95. Our engineer also finds that in accepting the second bid he would obtain the additional 5.15 H. P. at $2.91 per H. P. Therefore, he recommends the acceptance of what at first seemed to be the highest bid. No moralizing upon what has been said is necessary for the engineer, but the foregoing incidents assure us in a mild way that, in view of the advanced position we now hold in our profession, it becomes necessary that we refrain from expressing our opinions upon the spur of the moment, but must take into consideration all the circumstances and conditions obtainable in each case before passing judgment, thereby not only doing justice to ourselves, but preserving our reputation, not as mere runners, but as engineers who understand their business.

Witwatersrand, South Africa, Gold Yield, '97.

Tailings—Tons crushed	3,740,799
Value	£2,775,108
Shillings per ton	14.84
Concentrates	£457,780
Dry crushing	£40,517
Other methods	£300,578

The figures for the cyanide zinc process are:

Tons treated	3,020,311
Assay value per ton (shillings)	20.75
Gold won	£2,267,155
Gold won per ton (shillings)	15.01
Concentrates treated (tons)	33,631
Assay value per ton (shillings)	130.25
Gold won	£171,443
Gold won per ton (shillings)	101.96

To these figures should be added the dry-crushing figures given above. Next comes the Siemens & Halske process:

Tons treated	720,488
Assay value (shillings)	21.30
Gold won	£507,303
Gold won per ton (shillings)	14.10

The only district in this Republic, except the Rand, where the Siemens-Halske process is used is the Pilgrim's Rest district, where in 1897 gold worth £8944 was won from 6170 tons, no return being made for 1896. Next comes the treatment of concentrates by the chlorination process:

Tons treated	15,599
Assay value (shillings)	391.63
Gold won	£286,337
Gold won per ton (shillings)	367.12

The gold won by other chemical processes amounted in 1897 to £300,578, as against £34,180 in 1896.

All these figures point to a very great advance both in chemical and metallurgical science and in the extension and enlargement of chemical plant and reduction appliances.—South African Mining Journal.

UNITED STATES SURVEYOR GENERAL GLEAVES, who took office last month, has found that to complete the surveys of many townships in the State only a little work on each is necessary, two or three sections in many instances being all that have not been surveyed. He has a plan by which this work may be done expeditiously and with comparatively small cost to the Government. It is to district the State, appoint a deputy for each district and pay him a salary for finishing up the incomplete township maps. The present system is to get bids for each piece of work, no matter how small. Bidders in figuring include their expenses for going to each place. Bids are not always accepted, so that new proposals are asked, and frequently a long time elapses before the survey is ordered. It is believed that under Surveyor General Gleaves' plan the expense will not be half so great as under the old method, and the work will be done without delay.—Grass Valley, Cal., Union.

AN exchange gives the following wholesome advice to mining claim owners: If you have a piece of mining property and your neighbor alongside has another; if you cannot develop or sell your own, do not be afraid to help your neighbor dispose of his. Every mine opened in the country increases the value of every other mine or "prospect." If you can't sell yours to-day, a good mine opened alongside of it will help to dispose of it at some future time. It won't help the value to cry down that of your neighbor.

FROM W. J. Clark, Mullan, Idaho, the California State Mining Bureau is in receipt of plattnerite, or dioxide of lead, a scarce mineral of little commercial value, but to cabinet compilers of an estimated value of $90 per pound.

Reboring a Steam Cylinder.

A very effective method of reboring a damaged cylinder is described by Charles A. Hague in the *American Machine Shop*. A broken piston ring caused the damage, the cylinder being found to be rutted and scored from end to end, and pretty much all round, nearly an eighth of an inch in places. The work was done during a shut-down for a holiday. The engine was of the inverted, vertical type, the cylinder 36 inches in diameter and 60 inches stroke; the piston was of the box form, fitted with a bull ring, in two sections, with two packing rings. All that was necessary in preparing the piston was to measure the cylinder as it was before the cutting, then allowing for the amount to be bored out in renewing the scores, make a new bull ring, in whose inner circumference would fit the piston body, and whose outer diameter would correspond to the rebored cylinder, and to this new bull ring have fitted new packing rings.

This work upon the piston rings could all be done in advance, the head having been taken off the cylinder one night and the necessary measurements made, the exact size of the new packing rings giving a gauge to which the cylinder was to be finally bored. Every other possible preparation that could be thought of and made in advance was looked carefully after, leaving nothing but the actual work of setting the tools and boring the cylinder. A suitable bar was found which was used for repair work. It was of good size and had a traveling head moved along by means of a feed screw, which in turn was actuated by the well-known "star feed," the screw being let into a groove in the side of the bar, and engaging with a nut attached to the boring head in the usual manner, the boring tools being, of course, secured in the rim of the head.

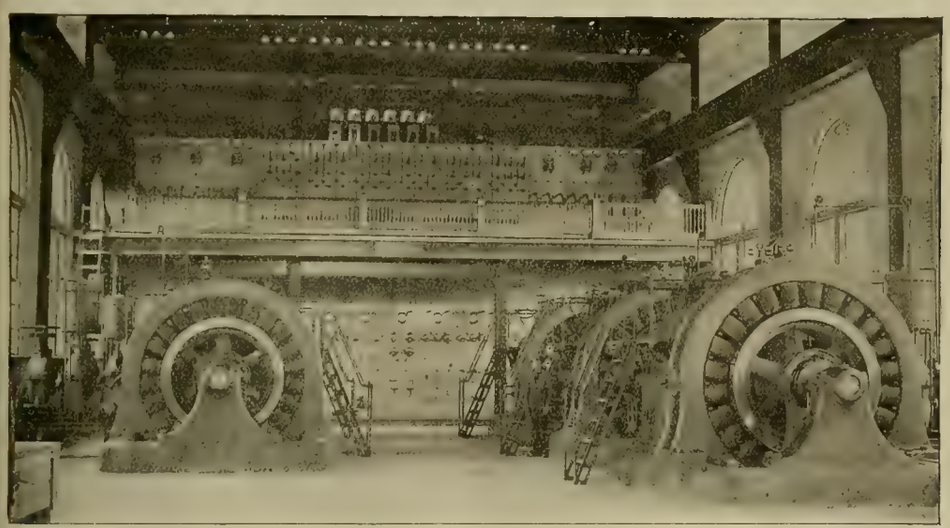
At one end of the boring bar, the upper end in this case, there was fitted a large spur gear, but so arranged that it could be readily moved along the bar as different work might demand. This gear was driven by a small pinion, also adjustable for different needs, and attached to a small shaft parallel with the boring bar. The whole driving mechanism and the end of the bar were strongly supported by a cross-shaped framing of cast-iron, which could be secured to a cylinder by using the regular cylinder head studs. This left everything clear within the cylinder, so that the counterbore could be cleaned up by proper adjustment of the cutting tool when the boring head was at the upper end of the cylinder. It was found that it would be desirable to employ bevel gears, so as to obtain a horizontal pulley shaft, and therefore a couple of brackets were fitted to the boring-bar frame to carry the second shaft. All of this and other work needed to prepare the bar for immediate use upon this particular cylinder was done in advance, and everything was ready for prompt action.

The lower end of the boring bar was supported upon a steel center like a lathe center, fitted tightly into a cast iron block, the block taking the place of the stuffing box gland. The lower cylinder head, the entablature, and the framing being undisturbed, of course the alignment of the bore of the cylinder after finishing was assured, the upper end of the bar being carefully set by means of calipers, with the old counterbore at the top. The counterbore at the bottom of the cylinder was first made by setting out the cutting tool at the lower port, care being taken to have it just a little larger than the proposed new diameter of the working part of the cylinder; then the upper counterbore was made also of the proper diameter and depth, and there was then nothing to do but to carry a plain clear cutting from one counterbore to the other. This was done in two cuts. The roughing cut was made with three cutters and went through with great rapidity; the finishing cut was made with one broad-nosed tool, also with rapid feed, but taking out very little stock. The first cut went through in 132 minutes, and the second in 164 minutes; the first with the cutting edges at the rate of 19 feet per minute each, and a moderate feed, the second at 12 feet per minute, with about a three-eighths feed per revolution. The stock in the cylinder casting being of good quality, the newly made bore was a beauty. It took three hours in the morning to get ready for operations, one hour to finish the counterbores, five hours to bore the cylinder proper, and two hours to put the engine in order for running, the piston packing having been fitted while the boring was going on.

The boring bar was driven during this work by a small steam engine hired for the purpose. Upon the shaft of the spur pinion, already referred to, was a bevel gear which in turn meshed with a pinion keyed to a second shaft, and upon the end of this second shaft was a belt pulley. Power was transmitted from the engine to this pulley. A small steam engine, about 6x12 inches, furnished with steam from the regular boilers, and bolted to the engine room floor, provided a steady and reliable source of power, and the work went smoothly along, without interruption or mishap, to a complete satisfactory conclusion. The boring bar was removed, the cylinder cleaned out, the piston put into place, the head put on, and in just about eleven hours from the start steam was turned on, and the new bored

cylinder was doing work. It had been necessary to make some small bearings for the driving mechanism of the bar, but altogether the incidental expenses were very light, and in proportion to the benefits realized not to be considered.

Exploding Submarine Mines.



At the New York electrical exhibition there are displayed Edison's magnetic separator for iron ore, Moore's vacuum tube light, and Marconi's wireless system of telegraphy. The greatest novelty is a new method of blowing up submarine mines. The common way is to put an electric fuse inside the mine, and then connect it with wires which run to some convenient station on land. Here a battery is brought into requisition at the proper time. An electric switch having been closed, the current flows through the wires (miles in length, perhaps), and ignites the mine. The plan which is illustrated at the exhibition is to place, either inside or outside the mine, in connection with the fuse, a coherer such as Marconi uses in his receiving apparatus. A small battery is also placed beside the mine. No wires are run to the shore. Then at any suitable point, on ship or land, apparatus like Marconi's transmitter is brought into play. Merely closing the key or switch, at the transmitter, explodes the mine.

The coherer in the mine is so connected with the wires of the small close battery beside it that the current would flow through it and all other apparatus on the circuit (the fuse, for instance) only when a tiny gap in the coherer is bridged. This gap is scarcely a tenth of an inch wide, and between the bits of silver thus separated are some metal filings. The instant that the coherer is hit by certain electro-magnetic waves, sent flying from the transmitter, and traveling through the air and water for miles without any wire, the filings fly up and close the gap. Then the current flows through the fuse and the mine blows up.

There are several questions to be considered before this plan can be pronounced better than the other. It has advantages and disadvantages, and Uncle Sam has not yet adopted it.

Pioneer Power Plant, Ogden, Utah.

In the issue of April 30th appeared a technical description of a successful long-distance transmission

GENERATING STATION PIONEER POWER PLANT, OGDEN, UTAH.

experiment at the generating station of the Pioneer Electric Co. at Ogden, Utah. Herewith is presented a view of the station from which the experiment referred to was made.

A DUTCH JOURNAL gives a forecast of how long tin mining will last in the islands of Banka and Billiton. During the last sixteen years Banka yielded a yearly average of about 2,500 tons of this metal. Borings show that this output may last over thirty years, without any marked falling off. Billiton's tin resources, with a yield of about 2,000 tons yearly, will only last four years.

MINING ENGINEER H. C. SOUTHWORTH says: "A block of ground 850 feet deep, 500 feet long and an average width of the lode 10 feet, would give approximately 350,000 tons of rock, which, if yielding 1¼% copper, would give 4400 tons of copper, or about 8,800,000 pounds. At 12 cents a pound, this would be worth about $1,000,000.

A PAPER from the *Comptes Rendus* is noted in which D. Berthelot describes a new determination of the fusing points of silver and gold. A platinum-iridium thermo-electric cell was used for the purpose, and the melting point of silver found to be 962° as an average of six experiments, while that of gold is 1064°.

Manganese, Cobalt and Nickel Mining in Chili.

Manganese, nickel, cobalt, zinc and borax mining in Chili is the subject of an interesting German consular report translated for the *American Manufacturer*. The manganese deposits in the department of Freirina, the southern coast territory of the province of Atacama, are very rich in high grade ore. Fine ore is also found in the province of Coquimbo. An analysis of three kinds of ore from the latter province showed 40.79, 52.66 and 40 per cent of metallic manganese. The principal ore beds are located at Astilla, which is connected by railroad with the port of Carrizal Bajo; at Palo Blanco, Talquilla, Yerbas Buenas, and Charnarcito, all of which places are without rail connection with their nearest port, that of Totoralillo. Canas and Corral Quemado are at the head of a railroad leading from the coast to the mine. Cerro de la Gloria and Esquivel, like the former, located in the department of Elgui, have no shipping facilities whatever.

In the rich copper mines of Catemu, province of Aconcagua, manganese ore is mined from several veins. In connection with the mines, the company operates a small smelter, "Marquinas," which is located three miles from Chagres station, on the State railway, Las Vegas–San Felipe.

The Chilian manganese industry has made no progress during the fourteen years of its existence. In 1896 there were exported 26,151 tons.

The price of manganese ore is quoted since 1896 at £1 11s 8d, or about $8.

The industry is on the decline at present and there is little prospect of improvement in the immediate future. This is explained by the competition of other manganese producing regions, such as the Caucasus, southern Spain, India and Japan, which are located more conveniently to the principal consumers—Great Britain and the United States; other causes are the decline of the manganese prices during the last few years, the lack of transportation facilities between the Chilian mines and the principal shipping points, as Valparaiso, Carrizal Bajo and Coquimbo, crude and antiquated mining machinery and high ocean freight rates.

Manganese is used in the chemical industry as disinfectant and for bleaching paper, but by far the largest part of the world's manganese production is consumed in the manufacture of steel and finer alloys, such as manganese bronze. But with the exception of an infant paper industry at Llai-Llai and Buin, there are no such industries in Chili, hence the home consumption of manganese is small.

The Chilian cobalt mining industry is old, but it was never important. The highest export figure reached since 1844 was in 1874, when 685 tons were exported. In most of the silver mines cobalt is found at Mina Blanca de San Juan, department of Freirina, at Manillas, and Tambillas Buitre, in province of Coquimbo, and Cajon del Yeso, province of Santiago.

Nickel, like cobalt, occurs in all the silver ores. Especially high in nickel is the ore from the Colorado de Chanarcillo mine. Rich nickel veins are also found at Portezuela de Carrizo, near Huasca, and at San Pedro, near the small port of Flamenco, south of Chanaral. The export of nickel is insignificant and home consumption small, as there are no industries in Chili which could utilize it to any large extent. A small part of the nickel output enters into the fractional currency of the country.

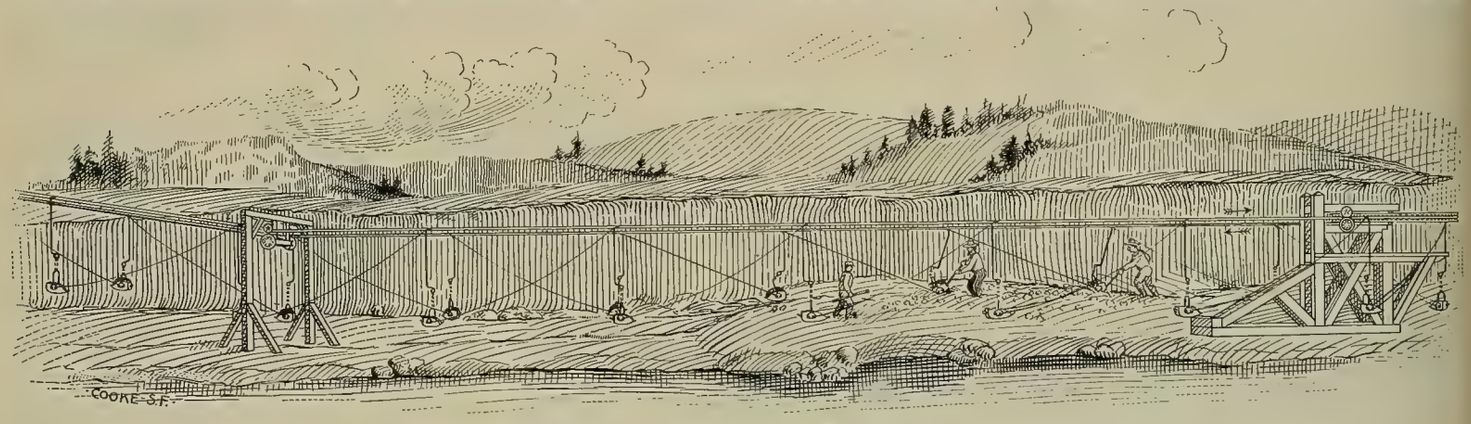
Zinc occurs in some of the Chilian silver ores, especially those of Chanarcillo. The gold ores of Andacollo also contain some zinc blende, but the export of zinc is small.

Borate of lime is found all over northern Chili, and it is produced and exported in large quantities. The export in 1806 amounted to 8485 tons, that of calcined borax in 1895 to 107 tons.

As a rule, the mining of the less precious metals in Chili is declining with every year, owing to the poor shipping facilities, and the decline in the price of the metals, which can be produced cheaper in competing countries.

OUR Consul at Barmen writes that Joseph Kohlendorfer of Landshut, Bavaria, has invented a new process for making petroleum briquettes, by which petroleum refuse is worked up in such a manner as to assume the form of a solid substance, easily handled, and constituting a cheap and convenient fuel. In this process about 10 per cent of soda lye, with 10 per cent of any other kind of fatty matter—tallow, for instance—is heated in a boiler, either by superheated steam or the exclusion of air, and enough petroleum refuse is added to the heated mass to make up 100 parts. This mixture is then heated, under constant stirring for about one hour, the time varying with the mode and intensity of heating. Attention should be paid to prevent the temperature reaching the boiling point of petroleum, as in this case a large quantity of froth would form. In this incipient state of saponification, the mass acquires the property of taking up large quantities of fluid rock oil, and if this incorporation proceeds too slowly or remains incomplete, it may be hastened by adding a little soda lye. The mixture is run into molds and allowed to cool, when it may be cut into pieces of any desired form. Coal dust, saw dust or other refuse may be added during the process of manufacture, according to the use for which the briquettes are destined; and, if it should be desired to obtain a product of less consistency, the grease may be entirely or partially replaced by resin or resin acid, the product in either case having more than 80 per cent of petroleum, more than 90 per cent of combustible substances, and less than 5 per cent of incombustible residue.

A SIMPLE AND EFFECTIVE WAY of clearing rusted iron articles, no matter how badly they are rusted, according to Carl Hering in the *Electrical World*, consists in attaching a piece of ordinary zinc to the articles and then letting them lie in water to which a little sulphuric acid is added. They should be left immersed for several days, or a week, until the rust has entirely disappeared, the time depending on how deeply they are rusted. If there is much rust, a little sulphuric acid should be added occasionally. The essential part of the process is that the zinc must be in good electrical contact with the iron; a good way is to twist an iron wire tightly around the object and connect this with the zinc, for which a remnant of a battery zinc is suitable, as it has a binding-post. Besides the simplicity of this process, it has the great advantage that the iron itself is not attacked in the least as long as the zinc is in good electrical contact with it. When there is only a little rust, a galvanized iron wire wrapped around the object will take the place of the zinc, provided the acid is not too strong. The articles will come out in a dark gray or black color and should then be washed thoroughly and oiled. The method is specially applicable to objects with sharp corners or edges, or to files and other objects on which buffing wheels ought not to be used. The rusted iron and the zinc make a short-circuited battery, the action of which reduces the rust back to iron, this action continuing as long as any rust is left.



AT Seattle, Wash., last Thursday the Alaska Traffic Association was formed to control rates from Pacific coast points to points on the Yukon river. Transporting companies of Seattle, San Francisco, Vancouver and Portland have agreed to abide by its decision to establish a rate of $275 from St. Michaels to Dawson. The rate from coast points to Dawson was made $300 for first-class accommodations on the larger steamers. The second-class rate was placed at $250, so that it makes no difference to the association if the tramp vessels make a $10 rate to St. Michaels, as prospectors will have to pay as much to get from the mouth of the Yukon to Dawson as they would from Seattle. The freight rate decided on was $10 per hundred from Seattle to Dawson. A committee was appointed to decide on rates to be charged by steam schooners and sailing vessels. The Alaska Commercial Co. was not represented.

IN the U. S. District Court of California this week were convicted three Chinese, arrested at Gold Run, Placer Co., for "mining by the hydraulic process without the necessary permit under the Caminetti law." One of the witnesses for the defendants stated that the Chinese were not hydraulic mining; that they only thought they were; that hydraulic mining always paid a dividend; that defendants derived no profit from their efforts; hence they were not engaged in "hydraulic mining." But the judge was not impressed with that novel line of argument.

THE following may be taken as representative of the chemical composition of granite and syenite: Granite—Silica 72.07, alumina 14.81, peroxide of iron 2.22, potash 5.11, soda 2.79, lime 1.63, magnesia .33. Syenite—Silica 59.83, alumina 16.85, peroxide of iron, 7.01, lime 4.43, magnesia 2.61, potash 6.57, soda 2.44.

A New Use of the Wire Cable.

Herewith is illustrated A. S. Hallidie's system of collecting and transporting earth and other material by means of an endless wire cable moving overhead, and driven by steam or other power. The earth, gravel or tailings are scooped up by scrapers, very much in the same manner as by horses, only that, instead of horse power, steam or other power may be used and the hauling done by a steel wire rope. From the illustration it will be seen that the scrapers are guided by a man armed with a piece of gaspipe about 4 feet long, which he slips on to the projecting finger on the back end of the scraper and regulates the depth of the scoop and the place where the scooping is to be done. The scrapers are hung to clips secured to the cable, about 15 feet apart. The larger is of steel, and rigid for about half way down. The lower half is flexible, and consists of a piece of flat chain that allows the scraper to adjust itself to the work to be done, and which can be raised or lowered at will. The scraper is hung on double trunnions, which permit of a free movement, but give a steady base for the scraper to hang on after it is loaded and on its way to the dumping place. The pulling of the scraper is done by steel draft ropes, which connect each scraper to the clip on the main cable 10 to 15 feet ahead, and all the scrapers are connected that way, so that there is a continuous row of them, each scraping up the earth and conveying it to its destination, which may be a mile or more away.

SCRAPING AND CARRYING EARTH BY USE OF A WIRE CABLE.

The cable overhead is supported on sheaves and travels at a speed of about 120 feet per minute; hence there are eight of them passing any given point in one minute, or 480 per hour, and, as they contain about 3 cubic feet each, they will excavate and convey away 144 cubic feet, or 53 cubic yards per hour. The cable is driven by a grip pulley, to which power is applied. The scrapers move continuously the whole length of the line and around the end pulleys. If the ground is hard and needs breaking up before the scrapers are applied, plows are used, which, in like manner, are hauled by the cable, instead of horses. It is a very effective and economical method of handling gravel, tailings and earth, and has the advantage of being able to convey the material almost any distance, and of excavating a considerable depth and width, as the cables can be lowered as well as the hanger, and the supporting frames for the sheaves can be moved as the work advances.

This is one of A. S. Hallidie's recent patents, date April 21st, '96, and the apparatus is worthy of the attention of those interested. A line can be seen working at the shops of the California Wire Works, where its operations will be easily understood. The office of the California Wire Works is at No. 330 Market St., corner of Battery St., San Francisco, and lines of various capacities are manufactured.

THE London *Electrician* says that experiments with iron-nickel alloys have shown that different co-efficients of expansion are obtained according to the percentages of the two metals. An alloy containing 45 per cent of nickel has the same co-efficient of expansion as platinum, and it is stated that this has been confirmed by experiments made at the Reichsanstalt. It is proposed to use this alloy to replace platinum in the manufacture of incandescent lamps.

Age of Specialists.

The mining business of the United States and all countries possessing modern facilities of transportation and ore treatment, with ordinary natural advantages, says F. Hartman, is entering upon a new era. All classes of people who have invested money in mining enterprises have been learning during the past quarter century that mining is a legitimate business, which must be governed by and through the application of business principles.

The people, too, have been learning that the mining business is one which presents a number of branches differing distinctly, each from the other, and requiring in each branch specific knowledge or skill which can be acquired only by years of practical and energetic study and observation in the field of practice. Men whose books treat on all branches of mining have already lost their occupation, and given way to men who have devoted their attention to one special branch or another. Not so long ago as twenty-five years mining companies and mine owners were employing one man to cover the great field which undertook to comprehend the several occupations: civil engineer, mining engineer, geologist, metallurgist, assayer, prospector, specialist on special or peculiar ore occurrence, mill process expert, master of smelting and manager in chief of all matters pertaining to mining and ore treatment.

To-day the manager of a mining enterprise, when he needs a geologist or mining specialist or metallurgist, employs one whose attention is not divided with half a dozen different professions, trades and mechanisms in the mining business. There are several distinctly different scientific lines in economic geology and mineralogy, each of which requires a life's study, leaving little, if any, time for the acquirement of competent knowledge of civil engineering or the mechanism. It is possible, through mechanical genius, to group mechanical operations, even to a combination with the use and economy of electricity. Mineralogy, so necessarily associated with economic geology, links the studies of co-existent sciences, but does not give the student time to sharpen the drills, square a set of timbers, fix the pumps, or survey a prospector's mineral location.

New Responsibilities.

To look over any journal devoted to machine construction is to be convinced by the evidence of almost every page that metal workers have entered upon an era of high development in practice, achievement and production. One of these evidences, says *Sparks*, is in the character of the machinery advertised for sale. It is automatic or universal; improved or quick-acting; or made for high-speed special work. Nor is the advancement confined to machine shop tools, for the march of improvement has also invaded the blacksmith shop, where the "bulldozer," the bender and former, the steam and drop hammer and the special forging machine are, for many purposes, taking the place of the hand hammer and anvil.

It is to be noted, too, that the materials operated upon have likewise undergone a change. Principal among these changes is the use of steel in the place of iron; and not only this, but steel itself has been studied, developed and differentiated until now almost every purpose for which it is used has its own particular specification.

It is to be said further that the employment of higher types of machine tools, as also the severer uses to which materials are now put, require more judgment, intelligence and skill on the part of the manipulator than ever in the world's history before. This being true, what shall be said of the man who must be developed to keep pace with this advancement? Does he realize that conditions have changed or are changing; that the rule of thumb is passing away; that he must not only become master of the new ways of working but also must learn the characteristics of the new materials he works with; that henceforth he is to be a thinking machine and will be called upon to give reasons and forecast results?

If he does perceive his relations to the new order of things, happy and well will it be with him. He will prepare himself for his ever-increasing responsibilities; will read, study and observe; will converse and compare; will make himself over and bring himself abreast of modern ideas and practice.

AT a meeting of the Tri-State Medical Society, April 5th, Dr. J. J. Brownson of Dubuque, Iowa, reported the case of a man who was terribly injured by coming in contact with a live electric wire. He lost one arm and part of his other hand, besides being burned on other parts of his body. The man received 2400 volts and still lived—the greatest number ever received by a human being and recovered from. The next greatest number of volts passed through the human body without causing death was received by a lineman in New York, who sustained a shock of 1000 on two different occasions, and whose miraculous escape from death has earned for him the sobriquet of the "human lightning rod."

THREE kinds of electric telegraphy across space are recognized by Prof. Silvanus P. Thompson—those depending respectively on conduction, induction and wave methods. The last kind has been employed by Prof. Slaby of Charlottenburg in sending intelligible Morse signals thirteen and one-quarter miles, balloons being used to raise the end conductors 1000 feet in the air. The signals were thus transmitted about seventy times the base line, but Marconi, in experiments at Spezzia, has sent them 500 times the length of the base line. Prof. Oliver J. Lodge has taken the first steps toward synchronizing the transmitting and receiving instruments, causing them to respond only to the waves of the period to which they are tuned. Prof. Thompson believes we may develop the conduction or induction methods so as to communicate between England and India or Cape Colony much more cheaply than by submarine cable, but doubts whether—on account of the earth's curvature—it would be practicable to cover such distances by any wave method.

Crude Petroleum and Crude Methods.

The current number of the "Memoirs of the Geographical Survey of India" has a monograph on petroleum in Burmah.

The methods of mining employed there are primitive, there being not the slightest difference in the method of sinking an oil well 100 years ago and that at present used. A brief outline will be read with interest by Pacific coast miners:

A hole 6½ feet square is dug and lined with wooden square set timbering. The tools used for digging consist chiefly of a chisel-shaped iron shoe fixed to a heavy club-shaped wooden handle. The iron shoe is round, slightly tapered and ends in a double-pointed edge. This tool can, of course, be used only in the softest strata. When hard beds are encountered, a lump of iron weighing 150 pounds, pierced at the upper end to allow a rope to pass, is suspended from a beam laid across the well. The rope is then cut, and the iron falls with sufficient force to produce a considerable hole in the hard rock. As the fall of the iron is so directed that it eventually strikes every point of the bottom, the bed is broken through, but not without great loss of time, for every time the weight has fallen a man is obliged to go down and fasten it to the rope, that it may be hauled up again. The appliances used for raising the material are a rude windlass, a leather rope and an ordinary earthen pot. The miners are lowered by a strong rope which ends in two slings, through which the miner's legs pass. At a given signal the coolies holding the other end of the rope gradually lower the miner into the well. The work of hauling him up again is facilitated by an inclined plane down which the coolies—often eleven in number—run, thus pulling him up more by their weight than by their physical strength. As the time the miner stays below is very limited, on account of the noxious gases, he would not have time, coming from the bright glare of day, to get his eyes accustomed to the darkness. By having his eyes previously tied up, he is enabled to see when down in the well. Before going down he puts on a quaint cap of palm leaves to protect his head from falling stones. The most remarkable feature is the exceedingly small percentage of useful time during which the man is engaged in digging. It varies from 18 to 10 per cent of the total time. This applies, of course, to wells that have reached the oil-bearing stratum. In the upper stratum a man may stay down for hours without being troubled from want of air. The cost of a well up to 250 feet may be estimated at 1200 rupees.

Mining Summary.

CALIFORNIA.

Amador.

Record: The Wildman-Mahoney three-compartment Emerson shaft is down 100 feet. A. Caminetti has taken possession of the Centennial mine, under bond to a San Francisco company, with T. Dillon Supt. The shaft will be kept clear of water. In April at the Potazuba they extended drift 69 feet; total length from shaft, 315 feet. At the Lincoln mine it is expected to have the new hoist ready to start up this month. The shaft is retimbered 40 feet.

Dispatch: At the Amelia mine work in the shaft is progressing. The shaft is now down nearly 600 feet.——At the South Eureka the contractors have completed the sinking of the 300 feet in the north shaft, and a station is being cut at the 1400-foot level preparatory to drifting. The South Eureka is a dividend-paying property. It has been in operation since '91. After about three years' work a body of ore was found and a 20-stamp mill erected. For several years after the mill was built the mine paid running expenses and has begun to reimburse the owners for the outlay of money expended in prospecting. The Gates canvas plant nets the company about $100 a month. The mill is run by electric power and the hoisting machinery is run by water power. There is a second shaft which is down 300 feet, and a drift connects the two shafts. Pay rock has been taken from the drifts in the south as well as from the north shaft. The mine is owned by a San Francisco company.——At the Iron Mass mine, near Volcano, they are stoping from the 309-foot level. The rock is of good quality.

Republican: Improvements are being made at the Ohio mine. Two shifts have been at work for several weeks. New ground is being explored with good prospects.——Work has been going on at the McIntire for two weeks in the old shaft, from which a drift 70 feet is being run.——Another contract has been let for further development of the Holliday mine, and probably two shifts will be put on. The shaft is down 65 feet.——At the Oneida two drifts are being run from the 1500-foot level, one north and one south. A small vein is being followed which it is believed will develop into a large ore body. Twenty-five men are employed.——At the Pocahontas three drifts are in progress—one from the 200, one from the 300 and one from the 700-foot level.

Butte.

The Costa Co., which for the past two years has been operating near Cherokee, will remove the blockade from the head of the big bedrock tunnel which drains the Spring Valley mine. This blockade was caused some years ago, by the slides from Table mountain filling the cut which led to the mouth of the tunnel. The object in opening this cut is to secure the gold that was left in the old flume. ——The Fall River quartz properties above Lumpkin will be worked this season. F. Elliot is manager.

Calaveras.

The Albany Flat and Storm King quartz mines, near San Andreas, have been bonded by D. Rolleri to the Nellie M. Co. of Stockton for $15,000, one-tenth down, the remainder on or before Feb. 3rd, 1900.——The Greek mine has temporarily suspended operations.——The monthly output of the Utica at Angels is said to be $200,000. About 450 miners are employed in the camp.——The Oriental, near West Point, is producing good rock. Shipments to the smelter gave returns of $130 to $180 per ton.——Fields & Porteus are developing their claim near Skull Flat. The ledge is from 6 to 14 inches wide.——The Scotch Co. is developing the Bay Horse and Henry mines.——R. Nixon is developing his property near Angels. The shaft is about 90 feet deep and a level has been run 60 feet.——The old Champion is being reopened by a Colorado company.

El Dorado.

At Grizzly Flat pumping the water from the main drifts of the Mt. Pleasant mine progresses. The gravel mine is working twenty men on paying gravel.

In the Hill Con. mine near Placerville a 24-foot ledge was discovered which with the exception of an 8-foot stringer running through it is of good milling quality.——The *Democrat* says that the Omo mine near Fairplay was sold last week for $40,000. W. F. Lupold, it is locally reported, has sold his mine near Omo to I. Monroe of San Francisco.——Croft & O'Brien found a good ore body near Georgetown, which is 14 feet wide.

Fresno.

Near Auberry the Table Mountain M. Co. is developing its property under the management of C. Knepper.——Johnson & Sullivan are running their mill night and day.——Pinnell & Landrum have bought the Boulder Gulch placer claim.——The river miners are expecting low water in the San Joaquin this season and are making preparations.

Kern.

The Waugaman mine, on Greenhorn mountain, is sold for $45,000 to Los Angeles men. This included about $11,000 worth of machinery. The milling test went $40 per ton.——J. B. Clifton, placer mining near Garlock last week, picked up a nugget on the Grenada claim. It was flat and thin, of irregular shape, 6 inches in length and 2½ inches wide; it weighed 15¾ ounces and is worth $250.

The Rand: The Red Dog mill at Johannesburg has run for the last ten days on ore from the Butte mine that averages over $62 to the ton.——A company is trying to bond the Pinmore mine which belongs to the Ashford M. Co. This mine has a blanket ledge and about 1000 feet of tunnels and inclines.——The St. Elmo mine has shut down, as the Boston & Famosa M. Co. could not afford to ship to their mill at Victor with a raise of $3.25 per ton on freight.

Miner: H. R. Bacon has started development work on his Republic group, and the shaft is down over 50 feet. A mill run of fifty tons will be made to test the worth of it, while the sinking of the shaft will be prosecuted.——Kleist and Faris have sold their wells to the Yellow Aster Co., which gives that corporation an abundant water supply for any emergency. Development work is being prosecuted.—— The run of Blackhawk ore turned out something over $100 per ton.——The Yellow Aster people are surveying for a reservoir site at their wells, preparatory to piping the water to their property on Rand mountain. Rumors of building a mill are premature, though this may be expected soon. It is probable the mill will be forty stamps and so constructed that sixty more may be added.

Mariposa.

In the Geary mine near Mariposa they are down about 90 feet and have a 4-foot vein of good milling ore. They are crushing fourteen tons of ore in twenty-four hours.

Mono.

In the Dunderberg, near Bridgeport, the new tunnel is in nearly 600 feet and is being pushed. The company have in contemplation the running of a new tunnel from Green creek to cut the ledges at depth.

Napa.

The following is the number of flasks of quicksilver shipped from the local mines during the month of April: Napa, 600; Ætna, 230; Great Western, 81; H. B. Lawley, 2; total, 913; an increase of twenty-five flasks over the previous month's shipment.

Nevada.

The North Bloomfield M. Co. will run a bedrock tunnel 800 feet at the Malakoff mine, to be 3½ feet at the roof, 6 feet bottom and 6½ feet high in the clear or inside timbers where timbers are needed.

June 1st the Electric Power Co.'s dam and reservoir at Rock creek, near Nevada City, will be finished. It will be 40 feet high, 260 feet long, 18 inches thick at top, 56 inches at base. It is calculated to hold sufficient water to furnish 1000 H. P. seventy days.

The Central mine, near Washington, has been bonded by a company represented by D. N. Cofiin and will begin work June 1st. The property has not been worked for some years. The bond calls for $20,000.

The La Belle quartz mine on Deer creek, J. L. Postlewaite Supt., is being worked by a Chicago company. Twelve tons sample ore yielded $20 per ton.

The Champion mine has temporarily shut down the 40-stamp mill pending the construction of a new flume.——The Reddick gravel mine continues its output of good gravel.——Poorman & Hastings, operating the Milliken Ranch drift mine, near Nevada City, struck the channel last week. The Manzanita Co., adjoining them on the west, will resume operations.——The Omaha Con. M. Co. at Grass Valley are adopting electric power and installing a 90 H. P. motor.——L. L. Meyers has bonded the National quartz mine, near Graniteville, and begun development work. G. H. Nihell is the Supt.

Placer.

The tunnel of the Eureka drift mine was finished to the 3000-foot mark. An upraise was started in soft rock, requiring timbering.——About thirty men are at work on the Cash Rock, near Forest Hill. They have completed their cribs for the dam and will soon commence operations in the bed of the stream. ——A contract has been let for 250 feet of tunnel on the Ralston mine at $4 per foot.

The *Herald* says that Leahy & Co. have struck a rich gravel channel on their claim near Rocklin. They prospected the gravel which they found to be 100 feet wide and 70 feet from the surface. They sunk a shaft and found the gravel 3 feet in thickness and of good quality. They have completed a steam hoist and as the gravel is of a soft slaty formation it will be worked for the present in an arrastra.

Sentinel: This season has been disastrous for hydraulic miners in Placer county. Fourteen permits to mine by the hydraulic process were issued by the U. S. Debris Commission. In nearly every case the pipe lines and monitors were in place behind the accepted restraining dams. Nearly all of these mines have been unable to turn on water. The only notable exception has been the Polar Star hydraulic mine at Dutch Flat, which has used 2000 inches of water for a portion of each day during the winter.

Other mines have also suffered on account of scarcity of water. W. S. Davis, who is working Texas Bar, has received notice from the California Water Co. that water cannot be supplied this season. He is removing his machinery from the river.——From the present outlook the Bear River Hydraulic Co., operating on Bear river, near Colfax, will not resume work this spring, owing to the short supply of water.——The Morning Star and Big Dipper drift gravel mines are equipped with machinery for use of steam power to run their stamp mills.——Much development work will be prosecuted this season by companies owning gravel and quartz properties on the upper Iowa Hill and Forest Hill Divides.

Plumas.

A diamond drill has been set to work in the Jamison mine.

San Bernardino.

P. Kahl is successfully working the tailings of an old silver mine near Fenners. He is using a dry concentration process.——Reed Bros. have found a property on the desert in the Virginia Dale district from which they took $300 last month. They found pieces ranging from $1 to $8.

San Diego.

The High Peak mine at Julian has resumed work.——The shaft on the Elebeda mine has reached 200 feet on the vein.—The Alpa has a crosscut tunnel 230 feet long tapping the ledge.

Shasta.

It is locally reported that W. R. Hall has made a strike in his mine at Hall City; the ledge is 2 feet wide and the ore assays from $50 to $100 per ton. —The Mountain Copper Co. will put in a pumping plant of sufficient capacity to furnish the smelter with all the water required.

Salee & McDonnell are developing the Bully Hill mine near Copper City. They have a ledge of copper ore in the drift, 1200 feet from its mouth, carrying native copper.——At Whiskeytown Bishop & Davis discovered a 5-foot ledge of free-milling ore of high grade. —The 18 stamp mill of the Niagara Co. at French Gulch has started on good ore. Twelve men are employed in the mine.

Searchlight: The Black Diamond and White Cloud mines, near Muletown, have eight tons of ore on the dump that averages $100 to the ton.——Near Whiskytown a strike was made of a ledge 5 feet wide that prospects in free gold.——DeVinne & Co. started an arrastra of five tons capacity.——A strike was made at the Milkmaid mine at French Gulch of a 7-foot ledge of $60 rock on the 200-foot level. This property is being developed in a systematic manner under the new management.——The bondholders of Ellery Bros.' mine at French Gulch have discontinued work.——Valuable ore is being taken out of the old Deming property from an abandoned tunnel. ——The mine owned by Simmons & Watson is yielding paying rock.

Sierra.

Work is resumed on the Alta quartz mine, near Alleghany City. J. W. Parsons will have charge of the work.——The Los Angeles men who bonded the Kenton quartz mine at Alleghany will develop it.

Siskiyou.

The American Bar claim on the Klamath river is yielding good returns, and work is prosecuted day and night, with thirty-eight men employed.——On Indian creek, Scott Valley, water is scarce—hardly enough to supply the arrastras for crushing purposes.——The San Francisco company operating the Wright and Eastlick mines at Oro Fino, working with the Evans elevators and giants, has a good supply of water in the ditch from Salmon mountain, but the season will be shorter than usual.——At the King Solomon mine, water is getting short, but the company intends running a tunnel to gain more water, so as to have enough for the steam engine and batteries.

The Yreka paper hears that J. Daggett intends starting up the Black Bear mill at Salmon river shortly in crushing quartz taken out during the past winter.——The wingdam of the Pacific mine at the mouth of Humbug has been completed, and foot dams will be built to permit pumping out and hoisting pay gravel.——Claims below on the Klamath river are in operation for hoisting, and are expected to pay handsomely this season on account of low water affording excellent opportunity for successful working.

News: Isgrigg & Carpenter are developing gravel and quartz claims on Soda creek.——Crowley & Co., on Hungry creek, have completed their tunnel to a distance of 600 feet. ——The Manzanita Bar, Benz Bar, Beebe Bar and McConnell & Quinn mines, on the Klamath river, are working.——The Yreka Co., near Yreka, have their tunnel in 350 feet. The prospects are improving.——W. C. Stanley upon his quartz property claims to have 200,000 tons of ore in sight. He intends to erect a 60-stamp mill this summer.——Williams & Aldridge struck a ledge on the North Fork of Humbug that goes $30 per ton. The vein is about 18 inches in width.——H. Finley has a force at work on his Lankey Bob property in White gulch. A 16-inch vein has been uncovered that assays $50 per ton.——Brown & Reeder cleaned up $700 from a short run of their mill in Fool's Paradise. Their ledge is 14 inches wide and yields ore averaging $16 a ton.——At C. B. Poole's mine, on Hungry creek, the ledge at the end of the 800-foot tunnel has widened to 8 feet. This claim has been bonded for three months for $50,000.—— W. Shurtleff is sinking a shaft and running a tunnel on Humbug. He has forty tons on the dump which will go $10 to the ton.

Reporter: The Salmon River M. Co. will commence work on the Gold Hill mine. The flume they are building will be four miles long and will be finished about the 1st of July. They have twenty men working on it.——Work on the tunnel at the Know Nothing creek is being continued. It is in 200 feet.——At the Hathaway Bros'. mine, which made a $7000 strike last summer, they are taking out ore. They handle three tons a day by the arrastra process.——At the Crapo mine, on Salmon river, they are hydraulicking with success. They are employing five men and expect to have water enough to run until the 1st of July.——Allen & Owen at Quartz Valley cleaned up $1300; some of their ore yielded $75 per ton.——They are hydraulicking at the McNeil mine with good results.—— The Gold Ball mine has ten stamps going night and day out of the twenty capacity of the mill. They expect to be able to obtain water for about six weeks yet.——The tunnel on the Corey mine has reached 300 feet.——At the Hardscrabble mine, French creek, they are taking out ore that runs $22 per ton.——A. Garrett, on his claim at Hamburgh Bar on Klamath river, has commenced hoisting gravel. The low water this season will enable him to work his force with success in bottoming the rich gravel along the bedrock in the channel of the stream.——Jillson & Roberts intend adding ten more stamps to their quartz mill at the old California Queen mine, near Henley. They are working a large force day and night, and the quartz taken out is reported yielding $100 a ton.—— The gravel taken out of the new shaft of the Greenhorn blue gravel mine is said to be rich.

Trinity.

In the vicinity of Junction City, the *Searchlight* says, only the French mines are operating and they are suffering from the short supply of water. The Haas mines, which usually cease operations in July, are making their final clean-up three months earlier this season. The Chapman and Fisher mines have closed down, as also numerous other properties. The season has been a disappointment. ——At Junction City the Cle Fse flume trestle, crossing Canyon creek, gave way 40 feet, cutting off the water supply at the mine. The flume will be replaced by pipe.

P. Marks discovered a 4-feet ledge near Trinity Center which is said to yield $35 per ton. He is making a shipment of silver ore to the smelter.

The Brown Bear mine and mill closed last week for general repairs, to be closed for three weeks. The company has kept a force employed on company work and leases and produced good values the past year. Development will be continued on the seventh level on a prospecting tunnel, which is in 700 feet and is expected to reach the Monte Cristo pay chute at 1300 feet.——The crosscut tunnel on the Boulder mines has reached 700 feet and is being pushed at the rate of 7⅛ feet per day.

Tuolumne.

Democrat: In the Alameda mine the main shaft has reached 650 feet, at which point sinking was discontinued, but will be resumed soon, when it is proposed to drive to the 800 mark. At the 600 level the vein is being drifted on north and south, while at the 300 crosscutting the ledge was commenced last week. The vein varies in width from 2 to 12 feet; it is expected the quartz will mill from $8 to $10 per ton. The ore contains high grade sulphurets. The mine is soon to be equipped with a 20-stamp mill.——At the Providence operations are being pushed. The 10-stamp mill will be running within thirty days. Ten stamps will be added in three months. A quantity of ore is on the dump.——At the Sell mine over 500 feet of the old tunnel have been straightened and retimbered. In the meantime ore is being taken from the stopes. The new mill was started up last week.

Yuba.

(Special Correspondence).—The recent discovery of an ore body of some magnitude and value in the Pennsylvania mine at this place is significant in several ways. After a large outlay of money in development work, the company sent in an expert, upon whose report it was concluded to abandon work. With his usual tenacity, however, Mgr. F. W. Page persisted in pushing the work, and, from some indications in the formation, he thought he felt warranted in his conclusions. He realized that cessation at that time meant condemnation of that portion of the country as a mining section. A day after notice had reached him to close down he opened a 12-foot ledge of ore, from which he milled 650 tons, that returned something over $5500, and, in addition, he saved seventy-two sacks of high-grade sulphurets. This ore body was discovered on the 800-foot level, and from present indications it warrants the prediction that the mine will give good yields for a long time. The ore is not all high grade; there is much of it that will run from $4 to $8 in free milling, with a fair percentage of high grade sulphurets.

Brown's Valley, May 9th, '98.

NEVADA.

(Special Correspondence).—The Boston-Nevada Copper Smelting Co. at Yerrington has closed down indefinitely.

Yerrington, Nev., May 5.

The Nevada M. Co., near Pioche, last week sent 1000 pounds of auro-cyanides, containing a small percentage of silver, to Utah. The company is also shipping high-grade ore.—— The gold mines in Western Nye look well; the Bell mill is running constantly, bullion is shipped regularly. The Knickerbocker mill will run this season.

W. Whalen is developing his property near Alpha.——On the Serpent mine, near Osceola, Wilson & Co. have several hundred tons ready for milling, which carries good values. They are erecting a small mill.——The Gold Crown M. Co. at Aurum is developing a silver property that carries ninety ounces silver to the ton. The ore is shipped to Salt Lake for treatment.——The Adelphi M. Co. of Smith Valley has been reorganized and will erect a stamp mill.

The Heleza M. Co. at Genoa proposes piping water four miles to the mine, using 6-inch pipe.——The Mountain City *Times* says that a porphyry dike in that neighborhood which has been considered of no value shows after a number of assays that it contains 100 ounces of silver and from $5 to $20 gold per ton.—— Ten tons of ore from the old Prince mine near Empire milled $10 per ton.

OREGON.

Near Pendleton Perkins & Atkinson have sixty acres of gravel 30 feet deep. They contemplate putting in a hydraulic plant.——The Mormon mines, owned by B. F. Grant, are said to have $300,000 invested in mining property, which consists of four square miles of ground, six miles of ditch, seven miles of steel pipe, a large reservoir and eight giants. —— Blalock Bros., operating near Grants Pass, made a cleanup of $1000 in gold. One nugget weighed $75.——The E. & E. mine at Bourne is in operation again after a suspension of work for several weeks, with thirty men. It is not yet known whether it will be conducted by the former lessee or whether the owners will take charge.——Utah capitalists are said to have bought the Claiborne mine, near Baker City.

WASHINGTON.

(Special Correspondence).—A company has been organized in Snohomish to work the National, Webster and Morning Star quartz mines near Mineral City, where a 25-ton daily capacity smelter will be built. The mining company does not pay for the smelter until it has run thirty days and shown its ability to save 95 per cent of the assay value. Considerable work has been done on the mining properties. The Morning Star is galena, the National carrying lime and the Webster a

gold value. Charcoal will be burnt on the company's property. —— Meyers Bros., at Meyers Falls, shipped sixteen tons which assays from $20 to $100 per ton.

Snohomish, May 3rd, '98.

At Republic development work has begun on the Republic No. 2 group, and tunnel work will be started at once. The tunnel will be 250 feet in length.——A new discovery of free milling ore is reported near Republic, of which top rock is said to assay from $2 to $9 per ton.——The Little Cove will soon have their shaft clear of water and be ready to go on with development work.——The Young America at Bossburg is shipping regularly. ——The Bonanza Co. has resumed operations on an extensive scale and has become a regular shipper. The work is down 400 feet and has 30 feet of ore.——Work has begun on the Eureka Queen, near Republic.——The Everett *Independent* states that the Sunset Copper Co., near Index, has struck a ledge which carries good ore. This is the second lode cut in running this tunnel.——The Copper Queen ledge has widened to 14 feet.

At Northport the fire caused a loss of about $75,000, of which there is $8000 insurance.

The Snohomish M. & M. Co. has contracted with the House-Dupae Co. for the erection of a twenty-five-ton daily capacity smelter at Mineral City.

BRITISH COLUMBIA.

The Smuggler Co. of Fairview have completed the survey of their new mill site and the tramway which will convey the ore from the mine to the mill to be erected on the bank of the Okanogan river.——Notwithstanding the big cave in the Le Roi, it shipped 956 tons of ore the last week in April to the Northport smelter.——By the middle of summer it expected that 1000 men will be employed in Ymir.

The Cariboo hydraulic mine near Quesnelle has commenced operations for '98. They turned on the water April 14 and are running night and day with a good head of water. From the report of Mgr. Hobson for 1897, the following is taken: Time occupied in washing, 111 days; quantity of water used, 223,416 miners' inches; quantity of gravel washed, 840,130 cubic yards; gold product for season, 8078 ounces; value of gold, $138,559.79; total expense of operating, $91,311.77. The water supply is from a ditch seventeen miles long, with a capacity of 3000 miners' inches. The former holds 304,000,000 cubic feet, equal to 140,741 miners' inches, and the latter 102,000,000 cubic feet, equal to 75,000 miners' inches; they are bringing in another ditch from Moorehead, at a cost of over $100,000. An earthen dam 485 feet long, or 50 feet extreme height, and containing 50,000 cubic yards of embankment, will retain a reservoir of water 35 feet in depth, covering an area of 620 acres, and will hold 550,000,000 cubic feet of water, equal to 254,629 miners' inches, or 127 days' water of 2000 miners' inches daily. The water from the reservoir will be delivered at the mine by a ditch 10½ miles long, the dimensions of which are 11 feet top, 5 feet bottom, 3 feet depth, grade 6 feet per mile, capacity 2500 miners' inches of water. The property comprises 446 acres, that extend along the ancient river channel 1⅞ miles. This company is consolidated with the Eureka mines, on Moorehead, with leases covering three miles of an ancient channel. The capital stock of the consolidated company is $5,000,000.

At New Denver the working of the Mollie Hughes and adjoining properties has developed such indications that every foot of ground on Goat mountain has been staked and in some instances twice staked. The prosecution of work on other claims near by has begun.——Four Mile creek mines are putting on more men and will increase the forces on the Comstock, Emily, Edith, Vancouver and Wakefield as soon as the roads are in condition to travel.——At Ten Mile more than 1000 tons of ore from the Enterprise await shipment. The work being done is all developing and blocking out ore bodies. Other Ten Mile properties are making advancement with the renewal of spring work.——Work on the Trail smelter at Rossland progresses and the furnaces will be blown in about July 1, when ore to the extent of 4000 tons will be on hand. The process of roasting ore has commenced. The smelter company has contracts for the purchase of ore from the War Eagle, Cliff and Center Star companies.——At Ymir work started on the Blackcock. This property was bonded to the Hall Mines, Limited, for $70,000. A force of thirty men was put to work.——Bam & Grantham made another strike on the El Dorado. The ore runs high in gold and copper.

At the B. C. mine, near Grand Forks, 1000 tons of ore is on the dump.——The C. & W. E. Co. has secured the Glasgow group, near Ymir, for $3500 cash. The property has a 6-foot ledge which assays $20 in gold per ton.

The *Spokesman-Review* says that the contract for the sale of the Le Roi mine and smelter to the B. A. Corporation has been signed in London and $500,000, the first payment, has been deposited there to be available by the Le Roi G. M. & S. Co. as soon as the final papers are signed. The sale is at $3,000,000 for the mine, smelter and other holdings, and the payments will be made at the rate of $500,000 per month. The smelter at Northport is to be transferred with the other property, but cannot be legally held by the London corporation, which will make the formation of an auxiliary company necessary. Until such a company is formed, the property will be transferred to a trustee.——Ore shipments for the week ending May 7th from Rossland were 2262 tons. Shipments for the same week last year were 1240 tons. Shipments since January 1, 1897, have been 100,203 tons.

THE KLONDIKE.

F. Banta of Fresno, Cal., is at work on Hunter s creek. He says: "I took a lease or lay on claim 41 on the 13th of November. We get 60 per cent of the gold we take out. On December 1st we began work. We put down five holes without striking pay dirt. The holes were from 20 to 32 feet deep. I started a hole at another point and the first pan I got out on reaching bedrock at 22 feet went $2.45 in gold. We are now getting all the way from $1 to $60 to the pan. The gold is coarse and one nugget that we picked out is worth $40.85. We are taking out from $500 to $1000 a day from that hole and are sinking two more holes. We have until June 1st to drift and are going to try and work out our claim by that time. If the pay continues as good we will get out between $75,000 and $150,000. C. Walters had a lay on claim 42, adjoining ours, but could not find the pay streak. He is now working for us. Nothing in the eatable line can be had for less than $1 a pound. It costs 25 per cent to send gold out from here by either of the two trading companies. I think I will carry the most of mine out myself."

H. R. Miller was at Skaguay May 2 from Dawson to the coast over the trail. He left Dawson on March 31. It is his opinion that navigation will be open between Dawson and St. Michael about June 1, or two weeks earlier than usual, owing to the warm weather that prevails on the Yukon. He looks for a general break-up of the ice this side of Dawson before the middle of May.

Miller says the steamers Bella and Weare will be likely to take the first consignment of gold this year to St. Michael. They are now with the Victoria and St. Michael in the ice near Circle City. When the river opens the Bella and Weare will go to Fort Hamlin for provisions, taking out the gold on their return trip from Dawson. The Victoria and St. Michael will steam to Dawson, waiting there to take prospecting parties to the Stewart river and other recently exploited territories. Fully $20,000,000 in gold will leave Dawson this summer, according to Miller's statements. No new strikes have been reported near Dawson, but Miller says that recent developments show that Sulphur and Dominion creeks are each fully as rich as Bonanza. He confirms the story of big discoveries on Monte Carlo island.

ALASKA.

The Alaska G. M. Co. of Indiana, capital stock $1,000,000, Prest. S. N. Chambers, Indianapolis, Sec. C. W. Moores, has organized to work properties.——Between the Comet and Jualin mines at Berners bay a tunnel 1500 feet long, 7x8, has been begun. The present intention is to erect ten stamps, a mill to be built to accommodate thirty.

IDAHO.

The Banner mine near Silver City cut the vein with a crosscut tunnel 657 feet in length at a vertical depth of 300 feet. The ore is said to be of good grade and fair size.——The Cumberland mine shipped 100 tons of ore and continues development work.——The Little Giant property near Warren has produced $250,000 from 150 feet of stoping ground, is being developed to a further depth of 150 feet by the owner, M. Reibold. This mine has a first-class hoist, a 5-stamp mill and a saw mill. The ore body on the 160-foot level shows 18 inches of ore which will mill $160 per ton. ——The Iola property, owned by the Honest John Co., shows promise of producing bullion after the new mill is set up. There are thirty men employed. The vein averages about 3 feet all through. The ore runs $30 per ton.

The DeLamar Co. declared a 12-cent dividend at the April meeting of the Board of Directors. The total product of the property for the month of March was $26,657; total expenses for the month, $19,422; net proceeds, $7235. Of the gross product $16,413 was from 900 tons of ore worked by the partially completed leaching plant. The entire leaching plant is not yet working. Except as to the power plant and the building, the mill will have been revolutionized when again running full handed.

UTAH.

At Silver City the mines employ double the number of men that they employed a year ago. The Swansea found a new vein on the lower level whose continuity is shown over 600 feet.——The Four Aces made a two-carload shipment, the values running in silver and lead, with a small percentage in gold.

The main shaft at the Bullion-Beck is being put down with dispatch to make connection with the ore bodies at a depth of 1300 feet. The ore body has been stripped for 240 feet, and for that distance the vein shows an average width of 20 feet. With present facilities for the extraction of ore it is impossible to raise the tonnage desired by the company, and to remedy this connection with the bodies on the 1300-foot level is being pushed.——At the property of the Orient M. Co., West Tintic, ore is being hoisted that shows thirty ounces silver, 20 per cent lead and $13 gold per ton. In the opening of the old workings a small streak was found that increased to 6 inches and widened into 18 inches. The ore shows a gross valuation of $53.80 per ton.—— The stockholders in the Beaver Lake M. Co. decided that with a smelting plant its properties can be made lucrative, and decided to take up the matter for definite action on May 30th. A report was submitted by Treas. Morris which showed that during the year $2495 had been expended on development work, and that the year closed with the company free from indebtedness. He thought that $8000 expended on furnaces for the smelting of the copper ores would soon pay for itself.——According to the local samplers, ore was last month received from twenty-six mining properties in Bingham, eight more than at the same time last year.——J. M. Bailey of the Queen of Sheba, Deep Creek, says that the failure of the Havens option was due to the failure of the process in use to save more than 20 per cent of the values. The volume of water is sufficient to provide for the handling of forty tons daily. The ore has an average valuation of over $8 per ton and over 2500 tons were put through.——The motion for a new trial in the case of Wilson vs. Triumph M. Co. disclosed that ore had been found which shows from 105 to 315 ounces silver per ton. In his suit against the company the plaintiff asked possession of the Mormon Chief, which was claimed by the Triumph people, under a relocation made by him and for damages in the sum of $1000. The jury found against him. The Triumph people now confess that on the eve of the trouble with the plaintiff, and at a depth of 100 feet in the shaft, it found 15 inches of ore, the assay from which showed 252 ounces silver, 7.4 per cent copper and small amounts in lead and gold.

Tribune: Utah's mining output for April was 9,896,715 pounds ore. During the same period there was billed out of the various smelters 4,718,718 pounds gold, silver and lead bullion, 506,666 pounds copper bullion, 192,950 pounds copper matte. The most striking feature in the record is the increase that has been made in the production of copper, which is nearly double the bullion record for April, 1897. There was an equally notable increase in the output of gold. The Ontario mine closed the month with its output reduced to 200 tons of ore, the proceeds of which were about enough to meet the requirements of the payroll and incidental expenses. Its old output was 2500 to 4000 tons a month. The Daly, that once hoisted 2100 tons for the mill and 400 tons for the market, allowed the month to go by without the shipping or milling of a pound of ore.

In the Valeo mine at Park City an ore body was discovered from 4 to 5 feet wide, bearing gold and copper.——The following ore shipments were made from Park City last week: Silver King, 488,520 pounds; Silver King, concentrates, 297,320; Anchor, concentrates, 223,160; Ontario, 45,320; Anchor, first-class, 146,600; Daily lease, 38,750; total, 1,239,670.—— The Dalton & Lark at Bingham is to start up with a considerable force. The 800 level will be pumped out and sinking resumed in the main incline, which has been sunk 850 feet, where some drifting was done and copper ore obtained.——Work has been resumed on the Annie group, near Mercur. The shaft has a depth of 350 feet, and the intention is to continue until a depth of 500 feet has been attained.——The Mollie Gibson group reports the ledge broken into and that it is well mineralized.——The output of the Grand Central mine at Tintic for April was 2100 tons.——The Glasgow & Western E. Co. has made final payment on the Montreal mine, near Milford, and further development will proceed at once. This is a copper property. A smelter will be erected on the ground.

The Utah Queen at Stockton has a fifty-ton shipment of high-grade ore ready, which will net over $6000.——In the Hidden Treasure two outfits are at work and both made shipments this week. Lynch Bros. shipped thirty tons of good ore and Hickman & Peterson shipped seventy-five tons from the same property.—— A seventy-five-ton shipment is being hauled from the Buckhorn, and regular shipments will be made through the season.——The No-You-Don't is shipping an average of seventy-five tons per month.——A twenty-ton shipment will be made from the Lion, and the Argent is shipping thirty tons per month.—— The owners of the Mercur mine were $12,000 in debt before they adopted the cyanide process. Since then they have paid thousands in dividends.——Ore is being sacked at the Northern Light, which averages 250 ounces silver and from $10 to $12 gold per ton.——The Geyser-Marion shipped 700 pounds of cyanides that returned $8500.——In April the Grand Central at Eureka shipped forty-eight cars of ore of an average value of $1000.——In the Sunbeam has been found a 2-foot vein of ore which runs 36 per cent lead and 50 ounces in silver. There is also a very fair grade of copper in the floor of the drift.——A shipment of nine cars of ore from the Bullion-Beck runs 66 ounces in silver, 13½ per cent lead and small percentages of gold and copper.——Sacramento ores show an increase in the quality of the ores, the values having advanced to $10 per ton in gold.——The Dexter Co. opened the month with a shipment of auro-cyanides of the value of $3500 and a gold bar of the value of $2000. The shipment was not a clean-up, but simply taken from the batteries, to be followed by another lot in a few days.

The Supreme Court of the United States has affirmed the validity of the eight hour law in this State. The law was directed particularly toward mine and smelter employers.

MONTANA.

Marcus Daly has filed on 8000 inches of water to be taken direct from the Bitter Root river through a ditch 4 feet deep and 16 feet wide, to be immediately constructed, says the Hamilton *News*. The contract has been let to Messrs. Karlman & Jennings, of Anaconda, the contractors who recently completed the flume for the Anaconda company near Anaconda at a cost of $300,000. The estimated cost of the ditch will be $200,000, the contract calls for its completion by Nov. 1, 1898. It is estimated that 3,000,000 feet of lumber will be used in the construction of the ditch, for fluming, etc., and that much heavy rock work and tunneling will be done.

J. R. McDonald of Milwaukee has arrived at Missoula, and it is said brings with him the necessary funds for beginning work on the Golden Scepter properties at Quigley in Granite county. The Golden Scepter is a phenomenal body of low-grade ore and many thousands of dollars have been spent in getting the property in condition to work. The company failed before completing the plant. A new company has been organized and as but a comparatively small outlay is necessary to complete the work it is anticipated that the mine will be producing bullion at an early date. The camp is back in the hills about thirty miles from the main line of the Northern Pacific. The plant includes an electric railway and one of the largest and finest mills in the State.

Gen. Mgr. Grant of the Parrot Co. has posted notices at the smelter and all of the Parrot properties informing the employes that those of them who wish to enlist and go to the front will find their old places waiting for them on their return from the war. The order applies to every one. The Parrot Co. has about 625 men on its Butte payroll, a number of whom are members of the militia.

Near Neihart a 2-foot vein was discovered in the I. X. L. mine, at 160 feet depth, which gives assay returns of 166.4 ounces silver and $24.20 gold per ton.——The Arkansas mine has found a ledge of considerable width that assays $30 per ton gold.——The Galena mine shipped three tons of ore that yielded $160 per ton gold.

Near Rochester the Nez Perce mine has a shaft 160 feet. The vein is 6 feet wide and assays 60 per cent lead, $2 gold and forty ounces silver.——The Ida Elmore has a vein 8 feet wide, and is a copper producer.——On the Lead Queen there is an 800-foot tunnel and a 200-foot shaft. The ore returns 65 per cent lead, forty ounces silver and $8 in gold. The vein is 5 feet wide.——The Liverpool mine, near Clancy, has resumed work. It has a depth of 460 feet. After it has been unwatered sinking will begin.——Herman & Co. are developing the Red Cloud. They have a shaft 140 feet deep and have had more or less ore from the start. They have several carloads of concentrating ore on the dump.—— The Libby *Montanian* says that during last season the payroll of the Libby mining district exceeded $10,000 a month for the six summer months during which mining was most active, and the most conservative estimate of the money that will be spent in mining this season puts it at $20,000 monthly, while the output of mineral from the camp will be three or four times that of last season. Besides this there will be many new mining enterprises started this year.——Nicar & Co., of South Bend, Ind., are engaged on Libby creek with a number of men sinking to bedrock in various places on their claims and making a thorough test of the ground. If the tests prove satisfactory, the company will put in a $20,000 hydraulic placer mining plant during the coming season.

SOUTH DAKOTA.

Deadwood's smelters have depended entirely upon eastern coke. The Hardin company at that place have bought 2500 acres of lignite coal land fifty miles from Deadwood, and will erect a plant to manufacture coke for the 200-ton smelter which they are about to build. Other plants will be erected there for manufacturing coke by the Hemingway process.

Twenty-five tons of ore are being shipped daily from the American Express group, near Deadwood. The shipment will soon be increased to forty tons a day. The ore averages $25 a ton. The ore body is 25 feet wide and 10 feet thick.——The shipments of ore from the Clinton mine, near Portland, have increased to nine cars a week and the force has enlarged. The Dividend mine has also increased the number of cars to nine a week. ——A force is working in the Golden Sands mine, owned by the Horseshoe M. Co. About twenty-five tons a week are shipped. The tunnel is in between 500 and 600 feet.

WYOMING.

At Sheridan Eastern men propose the manufacture of nickel steel from native copper upon an extensive scale. W. Runk, F. Zint, Highland Falls, N. Y.; W. Ecklin, W. M. Brock, F. Amiraux, Paterson, N. J.; Gen. Mgr., G. F. McLaughlin; H. Schraub, electrician. The company has seventy locations, necessitating the erection of large reduction works, smelters, etc. The motive power will consist of a turbine water wheel of 125 H. P., to be used to generate electricity and also run four air compressors. The compressors will run the diamond drills and will obviate the use of steam. The mines will be furnished with electric lights; automatic conveyors will be used to bring the ore to the surface. The cable is steel wire rope 2000 feet long. Engineer Weist has men surveying and laying out a road from the mines to the railroad. The company expects to employ 500 men.

MISSOURI.

Zinc ore decreased in value $1 per ton during April; highest price $24 per ton; $4 higher than the corresponding month of 1897. Lead ore is steady at Joplin, at $21.25 per thousand pounds delivered.

MINNESOTA.

The Golden Gate M. & D. Co. of Rainy River, Limited, has decided to spend $30,000 to develop their properties.

COLORADO.

(Special Correspondence).—The Hyalite G. M. & M. Co. of El Paso county has been incorporated to operate at Cripple Creek on Gold Hill. The company's property, which is a long lease, is situated on the extension of the Moon Anchor lead and has a cross vein from the Anchoria Leland. The shaft is 135 feet on the vein. The men are crosscutting the vein for the hanging wall, where they expect to find good values. The assays run in gold, silver and rosin zinc and a rare mineral called hyalite, after which the company took its name, is found. The property is equipped with 25 H. P. engine and 20 H. P. boiler.

Colorado Springs, May 6th, '98.

Otto Mears of the Silverton railroad says: "The mining industry in Colorado is more prosperous than ever I have known it to be. The reason is that our mines are mostly owned at home. I believe that fully three-fourths of the mining in this State is being done now by Colorado people. In former years booms were fostered by people going East to sell prospects. Such schemes did not induce Eastern people to invest very much money in Colorado and by reason of the poor returns, such methods tended to injure the reputation of the State. Our own people were backward until the panic came. Then the Sherman law was repealed, Eastern and foreign capitalists thought Colorado would 'go back' and they sold out their mining interests for what they could get. Local men were forced in many

cases to buy and our people turned to mining with the energy of desperation. The result was that in four years Colorado advanced to the first rank as a gold-producing State. It was a blessing to the State that conditions forced the people to depend upon their own resources. Now nearly all the dividends from mining stay in Colorado. Cripple Creek mines pay dividends to Colorado Springs and Denver; Creede pays tribute almost exclusively to Denver; Leadville's paying mines are nearly all owned in Colorado; mines in Boulder, Gilpin, Clear Creek and other northern counties are owned mostly by Denver people and in the great San Juan county I recall only two or three important producing mines that are owned by outside capital. Of these about one-half of the Tom Boy's dividends go to England and the balance stays in Colorado, and the Congress mine in Red Mountain district is owned in the East. Old mines that were abandoned by their non-resident owners have been purchased, reopened and developed by Colorado men with good results."

The shipments from Black Hawk for April were 342 carloads or 5472 tons, an increase over the same month of '97 of 44 carloads or 704 tons.——J. M. Baker, Sr., purchased the Monterey mine for $5000 cash. —During April the output of the Concrete mine was 1700 tons of ore, representing a daily output of nearly sixty tons.— —At the Phœnix-Burroughs and Pease-Kansas mines, near Central City, the April output was 2700 tons.——On the Modoc at Cripple Creek, at a depth of 60 feet, drifts have been extended both ways on the vein. The pay streak varies in width from 1 to 3 feet. The shipments run from $20 to $76 per ton.——Regular shipments are again made from the Hallett and Hamburg. The ore comes from the 270-foot level.——Potvine and Vaine are now in good ore on the Christmas. At the 150 level the chute has been drifted on and the quartz is found fully as rich as in the first level.——Work has been resumed in the Silver Ledge mine and mill near Silverton.——The Gold King has begun a crosscut tunnel, to be driven 5000 feet; it will cut the Gold King vein at a depth of 800 or 900 feet beneath its present workings. Power drills will be introduced and the work pushed. It will afford drainage, ventilation and transportation.——It is locally reported that a strike was made in the Belcher mine that runs ten ounces gold per ton.——A new town named Delia has been started at the head of Fall river, ten miles from Idaho Springs. There are 200 miners working in the district. There is a number of mines, among them the Alice and Chesapeake, located on this part of the sulphide belt.——The Joe Reynolds mine, Clear Creek county, is dropping its 800-foot shaft at the rate of 10 feet a week. The seventh level is being extended east to catch an ore body.

Occurrence of uranium in Gilpin county suggests the possibility of its being found in other portions of the sulphide belt. Its general occurrence is as pitchblende—a black, glossy, sub-metallic appearing substance found frequently in seams and cracks of the vein matter.

The Portland people have closed a yearly contract with the smelter at Colorado City for the treatment of all their ores. It is claimed that they will save $50,000 per annum in reduced rates of treatment.

A two-carload shipment of $60 ore was shipped from the Blue Bird at Cripple Creek. ——The gross value of the output of the Lillie last month was $70,000. This month the production will run from fifty to sixty tons per day, the greater portion of which will be sent to the reduction plant at Colorado Springs. ——Mattoon & Co., leasing on the Star of Bethlehem, are again in good ore. In the 160-foot level a new ore chute was opened up a few days ago. There appears to be about three grades, one running $25 and the other $80.——Scott & Miller, leasing on block 2 on the Colorado City, received from a trial shipment an average value of $60.——The Vindicator Con. Co. will soon begin the erection of a mill for the treatment of the ores taken from the property by the company and its lessees. Five sets of lessees are at work. The company recently paid its first dividend of 2½ cents—a total of $30,000.

Reporter: The Yak tunnel at Leadville is shipping three carloads a week and working with a reduced force. Operations on the head of the tunnel have been suspended for some time. It is claimed this is due to the inability to secure terms from the owners of the territory through which the tunnel passes.

Record: The tonnage treated from the Cripple Creek district for the month of April amounted to 32,000 tons of a value of $1,202,900, as against 30,850 tons valued at $1,123,650 during March. The following figures on the treatment of Cripple Creek ores are obtained from the management of the process plants of this district, Florence and Colorado City: The Gillette, Arequa and Brodie plants handled nearly 5500 tons of ore of a value of $157,000. The mills of Florence, including the Metallic Extraction Co., treated 11,500 tons valued at $365,000, while the Colorado-Philadelphia plant treated 6000 tons of an average value of $25 per ton or a total of $150,000, making a total for the treatment processes of 23,000 tons with a gross value of $572,000. The smelters handled 9000 tons of an average value of $70, or a total of $630,000.——In Gold Hill there are twelve shipping mines. The deepest is the Slide, which has reached 1100 feet. The greater part of the mine is being operated by leasers, though the company is taking out ore from the lower levels, and recently hoisted in one day twenty tons that ran 5¼ ounces gold per ton, taken from the 1000-foot level. All the leasers are doing well, several making $25 per day. The payrolls of the camp include 350 workmen of all grades.——During April sixteen mines of Empire shipped nineteen carloads of ore, averaging from fifteen to twenty tons per car. Shipments in April, 1897, were five cars.

At Crestone Hazard Bros. are opening a quartz vein 40 feet wide, known as the Kinney lode. Specimen assays at the surface run from $8 to $20 gold per ton and eleven ounces silver.——The Thomas Bodkin, owned by D. McLaren, has an ore shoot 75 feet wide that assays from $3 to $10 gold per ton at the surface.——The Blue Bell has 8 feet of ore and runs from $5 to $16 in gold and silver.——The Iowa mine at Silverton gives employment to 150 men. The mine is at an altitude of 12,000 feet above sea level. It has been developed by 8000 feet of tunnels, drifts and shafts. Last year it produced nearly $225,000 in gold, $80,000 in lead, and silver valued at $60,000. The Black Diamond group has been purchased by the company and will be operated in connection with the Iowa. This has a body of gold-bearing ore, similar to the Iowa. The properties adjoin and will be connected by underground workings. About twenty-five men are pushing ahead on the Diamond to expedite the Union. The latter is producing forty to fifty tons of ore daily. In the Diamond there are already 400 feet of ore opened up, and the work of development goes steadily on. The Iowa has a 100-stamp mill in operation.——Near the Iowa is the Royal Tiger, a lead property. It has about 2000 feet of development. The property shows a body of lead varying from 2 to 5 feet in width, running 50 to 60 per cent in that metal, and a per cent in gold and silver. The property has produced in the last six months $50,000. A large amount of ore has been blocked out and a tramway 1600 feet in length is being put up. With the completion of this improvement the Tiger will be able to produce 250 to 300 tons a month.——The Carlton Bros., at Leadville, are shipping about 600 tons of iron per month.——The Arkansas Valley smelter has on its payrolls about 600 men and is receiving about 500 tons of ore daily.

The Anaconda Co. at Cripple Creek is outputting at the rate of 800 tons per month, most of the ore going to the mills.——At the Portland, on the Hidden Treasure, twenty-five tons of carefully sorted sacked ore is in the underground safe, but in all probability the amount will be increased to fifty tons before the trial shipment will be made. Assays on the ore already saved have run all the way from $4000 to $80,000 to the ton.——Mattoon & Co. have reached ore in the Star of Bethlehem with a crosscut at 160 feet, and have started shipments again. They have a chute 3 feet wide that ships in two grades—some ore at $35 and other at $80 per ton.— —The output from the Moon-Anchor last month was close to 900 tons that averaged $55 per ton. The mine has a large amount of ore blocked out in levels run from the incline shaft above the 500-foot point. The new three-compartment working shaft has reached a depth of 460 feet.

Union lessees at Cripple Creek last week shipped forty-seven and a quarter tons of ore, valued at $2426.——Lessees on two blocks of the Hull City placer are shipping 160 tons of $75 ore weekly.——A Vindicator lessee shipped twenty tons of $145 ore from the first level of the old shaft.—— The Wisconsin shipped forty tons of smelting and milling ore.——The Blue Bird of Cripple Creek has adopted the co-operative plan of development. The company will supply the material and the miners the labor. There are 300 miners employed and there is ore in all the levels.—— The annual report of the Prince Albert at Cripple Creek shows cash on hand $17,002 40. They shipped during the year $92,342.50 worth of ore. The increase over 1897 is $6364 88. The company will continue to lease the properties in blocks.— Every mill in the Clear Creek valley, near Idaho Springs, is running full time, with ore enough ahead to insure steady work for the season. Considerable prospecting is being done in that section and surface assays give good returns.

Bride & Gill at Cripple Creek are doing development work on the Wisconsin and production for April was cut down to about 125 tons. They expect by the middle of the present month to resume their regular output of a carload a day. A shipment of screenings made by McCormack & Co. gave returns of $92 a ton. Griswold & Byers are making occasional shipments from their lease on the same property, getting sorted stuff in one grade that runs $75 to the ton. The lowest shipment of this, however, went $140, and the general average was in the neighborhood of $300 a ton.——The Victor mine shipped last month over 3000 tons of mill dirt, about 200 of first and 600 of second and third grades. The output of mill ore will be increased to 150 tons a day.——At Lake City the Yellow Medicine has resumed operations and is employing 100 men. A good grade of concentrates is turned out. The Yellow Medicine is owned by the Colorado F. & I. Co., which company has purchased the Capitol City mine, the latter being one of the rich galena producers in Hinsdale county.——The Lamartine mine at Idaho Springs, with a record of production of $3,000,000, at a distance of 1000 feet from the first ore body has come upon a second, believed to be of equal merit with the first ore chute. In this there is a change from silver to gold.——Near Gladstone, the most productive section of the San Juan between 1890 and 1896, and since practically neglected, new activity is manifest. The title of the Old Sampson, a shipper of earlier years to the extent of a quarter million dollars, struggling in litigation, is perfected, and the property is in the hands of Colorado and Eastern capitalists of means, who are reopening the property.—— The Gold King has been operating all winter, employing thirty-five men, and shipments have been resumed.——The East Monroe at Victor is being worked with day and night shifts and a depth of 230 feet has been reached. Copper ore has been found; assays show values of from $50 to $75 per ton.——At Silverton the Sunnyside Extension has again become a producer. It is said the mill will start the middle of next month for a summer's run.—— The Geyser at Silver Cliff is producing two tons of ore per day from the 2400-foot level. Thirty tons of ore have been shipped, besides the two cars last month.——The Nelson tunnel at Creede has reached 3500 feet.

NEW MEXICO.

Near Santa Rita an ore discovery was made that yields $18 gold and forty ounces silver per ton.——The Hanover, near Silver City, is daily producing fifty tons ore which is shipped to the smelter.——The Santa Rita Copper & Iron Co. is shipping three cars of iron ore per day.——F. P. Jones is concentrating ore from the old dumps of the Carrasca mine. He has twenty-five men at work. These are old dumps left by the Spaniards when the mine was worked a century ago.——H. A. Mills of Colorado Springs, owner of the Wonder mine at La Belle, will put in a stamp mill at the latter-named place to work Wonder and custom ores.——Work is resumed on the O. K. mine at La Belle. A new hoisting plant will be put on the property.——The Copper Glance mine, near Elizabethtown, will be reopened this month.——The cyanide mill at Hematite has begun operations.——The Alton mill in Hell canyon cleaned up $300 from a three days' run.

ARIZONA.

Work is to be resumed on the old Blue Nose mine at Harshaw, long idle on account of low price of silver.——The Hardshell mine, near Crittenden, is said to be turning out one ton of ore every five minutes; the ore is shipped to the El Paso smelter.——The *Bulletin* says: The Arizona Copper Co. is enlarging its plant and in a short time expects to do way with all of its small steam engines and furnish power by electricity.——The Coconino *Sun* says: Work on the smelter at Williams is progressing right along. Work on the railroad to the Grand Canyon was suspended several weeks ago, and it is not known when it will be resumed.

The ore body in the United Verde copper mine at the 500 level is nearly 400 feet wide, carrying copper, gold and silver.——The ore body in the Wicks & Allison mine, near Tucson, is growing larger as development proceeds. It is said to average $50 per ton. ——Work is progressing on the London and Cullen copper mines in the Whetstones. The tunnel has reached 120 feet, tapping the ledge at 300 feet depth.——The Azurite mines, near Tucson, have 4000 tons of ore on the dump, running from 8 to 12 per cent copper and from $4 to $17 per ton in gold. The high grade ore will be shipped until the company erects a smelter.——The Monte Cristo mine at Groom creek started up the middle of April and is in good ore, both gold and silver. Hutchins & Nolan will sink the shaft 250 feet.

Near Wickenburg the Helm Bros. are operating their 100-ton cyanide plant on the tailings of the Vulture mine with success.—— The Storm Cloud mine, Yavapai county, which is being developed by Eastern capital, has a shaft down 150 feet. A bar of bullion is being produced weekly from the ore taken out in development work.——A strike of copper sulphides was made in the seventh level of the Hoosier mine, of the United Globe mines of Arizona.——Brown Bros. & Co. have opened a body of silver-gold ore in the Lone Star mine, Mineral Park.——D. F. Kendrick of Minneapolis, Pres. Swiss Belle Co., operating in Santa Maria, has let a 250-foot contract, on completion of which the company will erect a large plant to work their ores, their present mill being too small.——J. Robberts commenced work on an 18-inch ledge, which is free milling and goes $30 per ton.

The Garcia G. M. Co. of London, Limited, will put in a pumping plant and three miles of pipe line from the Hassayampa.

The shaft of the Elkhart at Chloride is down 304 feet.——The Mammoth mine, near Tucson, recently shipped an $8000 gold brick. ——The White Hills Co. shipped six 200-pound bars of bullion to San Francisco.

A 250-ton shipment of ore from the Duquesne group, near Nogales, was sent to Pittsburg, where exhaustive tests have been made upon it. The ore carries considerable copper, accompanied with sulphur and zinc, and has consequently been of such rebellious nature that work upon like properties in the neighborhood had been abandoned. It is understood that successful methods of treatment have been found and machinery is on the way from the East to be erected upon the Duquesne properties.——The Pride of the West mine is a steady shipper, and has been for fourteen years. About forty tons are shipped monthly, yielding a net return of $15 per ton.

MEXICO.

Near Jupicari, Sonora, the Esperanza Co.— a corporation from Kansas City—is about opening extensive placer grounds. The company is organized with a capital of $600,000. G. W. Bradley will be Gen. Mgr.

The following report of operations of the Batopilas M. Co. for two years, from January 5, 1896, to January 2, 1898, has been received: The ores received and treated in Haciendas San Miguel and San Antonio were as follows:

	1st class ore, lbs.	*2d class ore,* lbs.	*3d class ore,* lbs.
1897.....	553,334	800,872	21,780
1896.....	333,270	810,011	19,529

Gen'l Mgr. Shepherd says: The product from mines during period has been less than expected, while expenses of working and low price of silver have augmented the unsatisfactory condition. Preparations are being made to increase San Antonio mill to seventy-five stamps and San Miguel mill to twenty-five stamps.

The Van Anda Co., E. Blewett Mgr., which proposes to establish a smelter at Vancouver, states that a sampling plant and assay office will be attached to the smelting works. The furnace is to have a daily smelting capacity of sixty tons. The ores will be roasted in piles, to burn off the sulphur and oxidize the iron, then charged into the furnace with coke, producing a 50 to 60 per cent matte. Further treatment of the matte, to produce metallic copper, will be carried on in reverberatory furnaces. The smelter will be under the superintendence of T. Kiddie.

About one ton of antimony is extracted daily from the Pueblo mines of Pueblo, worth $125 per ton.

AUSTRALIA.

The output of the Broken Hill Proprietary Company, Ltd., for the four weeks ending March 31st, was: Ore treated, 23,915 tons, for the following refinery products, including products from ores purchased: Gold 1513 ounces fine; silver, 330,126 ounces fine; soft lead, 2199 tons; antimonial lead, 45 tons (estimated). Also copper matte, containing copper, 3 tons (estimated); and 19,770 ounces fine silver (estimated).

Alaska and Kotzebue Sound Steamers.

JOHNSON-LOCKE MERCANTILE COMPANY, Agents,

"GOLD PICK LINE,"

609 Market Street, San Francisco, Will Dispatch the Following First-Class Steamers:

May 28th, for KOTZEBUE SOUND, DUTCH HARBOR, NUNIVAK ISLAND, HOOPER'S BAY, ST. MICHAEL and DAWSON CITY, the newly built triple expansion steamer "**GRACE DOLLAR.**" Upon arrival in ST. MICHAEL passengers for DAWSON CITY will be transferred to the newly built, highly powered river boats and barges, "**RIDEOUT,**" "**GOLD STAR,**" "**PINAFORE**" and others. The "**GRACE DOLLAR**" then will proceed without delay to KOTZEBUE SOUND, where passengers will be disembarked and placed upon the river steamer "**ARCTIC BIRD**" and will be given free passage up the Putnam River as far as FORT COSMOS. The Pacific Coast and Kotzebue Sound Transportation and Trading Company will also maintain at KOTZEBUE SOUND a Warehouse. Parties contemplating a trip to KOTZEBUE SOUND are strongly advised to take passage on the "**GRACE DOLLAR.**" She has a newly built triple expansion engine for the highest power; her bows will be sheathed so as to permit her making her way through the breaking ice; and the "**GRACE DOLLAR**" without question will be the first vessel reaching KOTZEBUE SOUND this year.

May 25th, JOHNSON-LOCKE MERCANTILE COMPANY, Agents, Will dispatch for DUTCH HARBOR, NUNIVAK ISLAND, HOOPER'S BAY, ST. MICHAEL and DAWSON CITY, the Steamship "**TILLAMOOK,**" Connecting at ST. MICHAEL with the Steamers "**STAGHOUND,**" "**GAME COCK,**" "**CITY OF DAWSON,**" and other boats.

June 1st, JOHNSON-LOCKE MERCANTILE COMPANY, Agents, will dispatch for ST. MICHAEL, DAWSON CITY, and YUKON RIVER POINTS, the magnificent Steamer "**MORGAN CITY.**" Capacity 700 passengers and 2000 tons freight. The "**MORGAN CITY**" connects at ST. MICHAEL with the "**GAME COCK,**" "**STAGHOUND,**" "**POWELL,**" "**ALVISO,**" "**RIDEOUT,**" "**GOLD STAR**" and "**CLAN MACDONALD.**"

Sailings of three additional ocean steamers early in June will be announced by us within a few days. Passenger and Freight Office

JOHNSON-LOCKE MERCANTILE COMPANY, 609 Market Street, San Francisco; 112 Yessler Way, Seattle; 809 Home Insurance Building, Chicago.

Coast Industrial Notes.

—The Union Oil Co. is putting up a 35,000-barrel storage tank at Coalinga, Cal.

—The Tubbs Cordage Company announce an advance on manila to 8¾ cents, and on sisal to 7¾ cents.

—About 150 men are at work for the O. R. & N. Co., laying steel rails between Umatilla and Wallula for $1.40 a day.

—The railroads have given California stockmen half rate on cattle, and it is estimated that 50,000 head will be shipped East.

—The horse cannery at Linnton, Or., where last year 9000 horses were slaughtered and canned, will shortly resume operations.

—From $10 to $20 is being offered Truckee ranchers for this season's hay before crops are harvested. Buyers are in Carson valley, Nev., offering $10.50.

—Redwood shipments for April were 14,000 M. feet, 12,000 of which went to San Francisco and southern California; the remainder to Hawaiian Islands and Europe.

—The Western American Co. has incorporated in Seattle, Wash., capital stock $500,000, to build a railroad from a point on the Carbon river to Puget sound and operate coal mines.

—A car of beeves were recently shipped from Benton county, Or., to Victoria, B. C. The average weight was 1600 pounds. Four cents a pound was the price paid, or $64 a head.

—The Canadian government has contracted with the Boston & Alaska Transportation Co. for the delivery of 400 tons of freight and 200 troops into the Yukon district of the Northwest Territory.

—Dunsmuirs deny the reported offer by them of the tug Lorne to the United States government. American vessels are still loading coal at Departure bay and Comox, B. C., for southern points.

—The Santa Fe Railroad Co. officials give notice that commencing May 2 the working time of all shop men on the system was increased fifteen hours a week, thus increasing the payroll 37 per cent.

—Reports from Astoria, Or., show that the salmon pack this season is 25 per cent less than last year. One cannery up to April 19th, '97, packed 2100 cases, and had only packed 300 cases on the same date this year.

—Tacoma, Wash., men have bought the Duff shingle mill at Kelso and purpose erecting the largest shingle mill on the coast. They will put in two ten-block machines, besides some double-block machines.

—The Con. Electric Light Co., Victoria, B. C., is locally reported to be preparing to utilize the water power at Goldstream for the operation of the electric lighting and railway system. The work involves expenditure of $100,000.

—While the manager of the Crockett sugar refinery at Stockton, Cal., cannot get labor for the beet fields, the Volunteers of America are trying to raise $200 in that city to enable that organization to provide meals and beds for tramps.

—Baker City, Oregon, proposes to build a gravity water system using 12,700 feet of steel hydraulic pipe, 39,940 feet of wrought-iron pipes with reservoirs, gates, hydrants and full circulating water mains. The distance from Elk creek to the city is 51,940 feet and the cost would be about $135,000. It recommends putting in eleven hydrants and connecting dead ends at a cost of $9000; new boilers and buildings, $1000; boring new wells and improving system, $10,000.

—The S. P. Company has recently put on, between Dunsmuir and Red Bluff, Cal., several new compound coal-burning engines, straight stack and ten wheelers of the very latest design. These locomotives are powerful and save fuel, but cause trouble to the company in running them through the heavy tunnels in the Sacramento canyon. A local paper asserts that "the exhaust from the straight stack is so strong as to blow the lagging and rocks out of the roofs of the tunnels."

—The occupation of the Philippines by American forces will greatly augment United States exports. Trade follows the flag. In February, '98, according to the official report of the Bureau of Statistics at Washington, the United States imported from the Philippines $186,358 value of merchandise, of which $113,328 was carried in American ships and $73,030 in British vessels. American imports from the Philippines for eight months ending with February were $2,240,176 value, and our exports to the islands $69,235.

—Bakersfield, Cal., was reached by the San Joaquin Valley road this week. For the present that point will be the southern terminus of the San Joaquin Valley railway, which will be operated from there to Stockton. There will remain to be built the interval between Stockton and Point Richmond. Nearly two years will yet be occupied in building the Valley road from Bakersfield to San Francisco bay, on account of the long tunnel. Thus far nearly $4,500,000 have been expended, and about $3,000,000 more will be required, making a total of $7,500,000. To meet it are the $2,500,000 of paid-up shares and the authorized issue of $5,000,000.

—The acceptance of the American tender for 13,000 tons of steel rails by the Railway Commissioner of the Victorian railways proved a surprise for the local commercial circles there. The tenders were open to all the world, and five were sent in. Two of these were American, two English and one German. One of the American tenders (that of the Carnegie Co.) was declared informal. The other (that of the Pennsylvania Steel Co.) was successful. The amount of the tender was £75,471, or about $377,350. This was the lowest. Next came the two English tenders at £79,214 and £81,256, respectively, or a difference in favor of the American tender of £3803, which is a pretty substantial amount. As compared with the former contract let to an English firm of £5 13s per ton, the American contract works out to only £4 19s 9d per ton on exactly the same specifications. This is the first time a big railway contract has gone to America from Australia. Commenting upon the result, the Melbourne *Age* says: "The result of the tender is corroborative of statements lately published in these columns showing that under protection the United States manufacturer has not alone developed a rail trade, and driven the British railmaker completely out of the American market, but has successfully invaded the British market itself under the 'beneficent' policy of free trade, and is, moreover, successfully competing against the British manufacturer in the markets abroad, which the latter held almost exclusively for so many years."

Personal.

G. H. NIHELL is Supt. National quartz mine, Graniteville, Cal.

J. EDDY, a mine owner, Grass Valley, Cal., is in San Francisco.

D. NEAGLE, Supt. Carlotta mine, Sonora, Cal., is in San Francisco.

F. DANT succeeds N. Carmichael as Supt. Karau mine, Mariposa, Cal.

A. TRITTENBACH, Supt. Dutch mine, Jamestown, Cal., is in San Francisco.

A. W. HAWLEY, a mine owner from Grass Valley, Cal., is in San Francisco.

L. E. SMITH becomes Gen. Mgr. Prince Albert G. M. Co., Cripple Creek, Colo.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., is in San Francisco.

J. J. CRAWFORD has returned to San Francisco from a business trip to El Dorado Co.

MARCUS DALY added $15,000 to an equal amount furnished by the State for Montana's exhibit at Omaha.

D. KEITH, managing owner Silver King mine, Park City, Utah, has returned home from San Francisco.

J. A. EDWARDS of Birmingham, Ala., is examining mining property in Yuba Co., Cal., with a view to purchase.

F. J. FLETTER of San Francisco, Pres. Brunswick Con. G. M. Co., Grass Valley, Cal., is on an official visit at the mine.

W. R. CHADBOURNE, Gen. Mgr. Mikado mine, Leadville, Colo., is examining the old Lindsay mine at Maybert, Cal.

H. A. BURIS, an English oil expert, is on his way from London to investigate the petroleum fields reported discovered last year in southeastern Alaska.

A. J. REYNOLDS has returned to London after buying No. 27, Dominion creek, in the Klondike district, for a London company and making other mining deals.

JOS. MCGILLIVRAY has returned from Cariboo, B. C., and next week starts for the Klondike, heading an expedition to develop property he has acquired therein.

ELWOOD MEAD of Wyoming has been appointed consulting expert in connection with the Bureau of Irrigation, which is about to be organized under the Department of Agriculture.

PROF. GEO. DAVIDSON of San Francisco will shortly assume the position of Prof. of Geography in the College of Commerce, to which he was recently elected by the regents of the University of California, who at this week's meeting voted him an annual salary of $4000.

H. BRATNOBER is reported tramping alone in a northwesterly direction somewhere between the Dalton trail and the source of the White river in Alaska. He will not return to civilization again until September. He may appear at the mouth of the Copper river in the autumn.

AT Houghton, Mich., J. L. Cooper, thirty years in charge of the smelters of the Detroit & Lake Superior Copper Co., has been appointed superintendent of the smelting department of the Quincy M. Co. J. Case, who succeeded Mr. Cooper on May 1st, has been appointed superintendent of the Dollar Bay smelters, vice R. G. Collins, who will manage the works of the Tamarack-Osceola Copper M. Co. at Dollar Bay.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MAY 3, 1898.

603,421.—WHEELED SCRAPER—W. C. Bradford, Arbuckle, Cal.

603,260.—LUBRICATING SHAFT BEARINGS—O. F. Cook, San Jose, Cal.

603,319.—SEPARATOR AND CONCENTRATOR—Crowell & Gale, S. F.

603,425.—GOVERNOR—C. Cummings, Oakland, Cal.

603,322.—OIL STOVE—E. H. Driggs, Berkeley, Cal.

603,562.—NECK YOKE—W. E. Haight, McMinnville, Or.

603,331.—BICYCLE BRAKE—F. H. Heath, Tacoma, Wash.

603,531.—DRILLING TOOL—I. W. Mason, Aberdeen, Wash.

603,281.—BICYCLE—T. P. McDermott, Portland, Or.

603,455.—PIPE BINDER—C. L. Pinney, Los Angeles, Cal.

603,579.—STEP LADDER—O. Richardson, Clipper Gap, Cal.

603,517.—GAME COUNTER—J. Schneider, S. F.

603,392.—WOODEN PIPE—W. J. Woodward, National City, Cal.

28,540.—DESIGN FOR DOOR LATCH.—R. H. Martens, Colfax, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEPARATOR AND CONCENTRATOR.—Charles E. Crowell, Stella, Cal., and Merritt F. Gale, San Francisco, Cal., said Gale assignor of entire interest to said Crowell. No. 603,319. Dated May 3, 1898. This invention relates to an improvement in that class of machines known as ore washers or separators, in which granular substances and minerals of different specific gravities are separated by agitating them in a current of water while enclosed in a suitable receptacle. The invention consists of one or more series of hoppers situated one below the other, so that the discharge from the uppermost will be delivered successively into the bottom of the next succeeding hopper, said hopper being of gradually increasing diameters, having upwardly diverging sides. Inclined overflow, directing lips surround the upper parts of the hoppers and discharge into annular surrounding troughs, and pipes connect these troughs successively with the bottom of the next succeeding hopper, so that an upward flow at a gradually decreasing rate takes place in each of the hoppers. In connection with these are inclined cylindrical screens, generally intermediate between one or more series of the hoppers, so as to receive the overflow from the preceding hopper and deliver it into the following one. Final discharge sluices and preliminary water and pulp receivers are employed with means for regulating the water supply and a device for diverging the supply of pulp alternately from one series of hoppers to another, so as to allow the idle one to be cleaned up.

PENDULUM ESCAPEMENTS.—F. Baginski, Allenstein, Germany, assignor to Henry H. Keeling, San Francisco, Cal. No. 603,419. Dated May 3, 1898. This invention relates to an escapement mechanism for timepieces, and other similar purposes. It consists, essentially, in the combination with an escapement wheel of the oscillatory pendulum carrier having the transverse arm fixed to and movable therewith, a pin carried by said arm is adapted to alternately engage with and disengage from the teeth of the escapement wheel, an independent weighted bell-crank arm or lever fulcrumed with relation to the escapement and pendulum, a segment having a projecting point adapted to engage with and disengage from the teeth of the escapement wheel in alteration with the movement of the first-named point, said point being connected by a link with the bell-crank lever, and is actuated by it.

WHEELED DUMPING SCRAPERS AND GRADERS. Walter C. Bradford, Arbuckle, Cal. No. 603,421. Dated May 3, 1898. The object of this invention is to provide a means whereby earth can be scraped up and the pan raised and lowered and discharged at any desired point with great facility. It consists of a bisecting pan fastened to a frame carrying a scraper or cutter at its forward end, links by which the pan is suspended, and a lever so connected as to actuate the rear portion of the pan to open or close them and a spring pressed lever by which the pan may be raised or depressed. The scraper has share or cutter in front, and the earth gathered by it is delivered into the receiving pan behind, and the pan when full may be raised and transported to any desired point by means of the wheels upon which the apparatus is mounted, after which the sections of the pan are opened away from each other so as to discharge the load.

GOVERNOR FOR AIR COMPRESSOR.—Charles Cummings, Oakland, Cal., assignor to the Pneumatic Power Co., San Francisco, Cal. No. 603,425. Dated May 3, 1898. This invention relates particularly to that class of air compressing machinery, in which two unequal pressures of air or other gas or fluid are employed both above the normal atmospheric pressure and circulating in a closed system. The present invention relates to a governing apparatus for automatically controlling the action of the air-compressing machinery. It consists essentially of a means for automatically keeping an arithmetical ratio or a constant difference of pressure between the two unequal pressures in an apparatus, in which these pressures are both above the normal atmospheric pressure and the means employed acts to vary the speed of the compressor so that it will generate more or less energy for the work to be done by the driven machine as may be required. The means employed consist of a governor which comprises connected pistons of equal pressure areas acted upon by the unequal pressures, means for counterbalancing the difference in pressure and holding the pistons in equilibrium and means operated by the connected pistons for controlling the compressor driver medium. A weighted lever is connected with and operated by the pistons to counterbalance the difference in pressure and hold the pistons in equilibrium and a valve controlling the supply pipe which leads to the motor actuating the compressor, is connected with the weighted lever and regulated by the movement of the governor pistons. A low pressure pipe leads from the low pressure conduit to the low pressure end of the governor and a high pressure pipe leads from the high pressure conduit to the high pressure end of the governor. Changing the initial pressure of air to be compressed varies the ratio of the initial to the final pressure and the efficiency of the system is thereby increased or decreased according as the initial pressure is made greater or less.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of references. Address J. D, Mining and Scientific Press.

WANTED.

Position by Practical Miner

Of twenty years' experience as superintendent or foreman. Good disciplinarian. First-class references. Address H. P., this office.

Mining Partner Wanted

With Capital to Develop One of the Largest and Richest Mines in Nevada County, California.

A rare opportunity for right party. There is millions in it. For full particulars, please address S. B. FOWLER, M. E., Grass Valley, Nevada County, California.

Assayer Wanted

FOR CENTRAL ARIZONA,

Who has a button and pulp scale or outfit complete. Single man. Must be able to check against smelters and be thorough. Wages $60 per month, with board and room. Must furnish references as to ability as assayer, also honesty, sobriety, etc. Address ARIZONA, Mining and Scientific Press Office, San Francisco, Cal.

Position Wanted by Millman.

Am at present foreman of prominent gold mining company's mill; desire position in central or southern part of California; satisfactory references furnished; am thorough at concentrators, either Frue, Triumph or Norbom; have also good references as assayer, all first-class and reliable. State salary and particulars. Address Gold Millman, Box B, Mining and Scientific Press office, San Francisco.

FOR SALE.

CONCENTRATOR.

Adapted for copper, lead or zinc ores; capacity 30 to 50 tons per day; complete, new, first-class, and in perfect running order; delivered on cars, cheap for cash, with or without the steam power plant. For specifications, address P. K. MINING CO., Antelope, Idaho.

The State Ore Sampling Co.

DENVER, COLO.

Gold, Silver, Lead and Copper Ores and Matte sampled and marketed to the best advantage. With modern mills and machinery our facilities for sampling ores are the best.

Our long experience in the market enables us to obtain the highest prices for all marketable ores. Write for our "Reference Book." Send analysis of your ore for prices and information.

BAILY & MONNIG, Managers.

HONDURAS CONCESSION.

WANTED,

PARTY to take an interest and the MANAGEMENT of a

PLACER CONCESSION

IN HONDURAS, same yielding $5.00 PER YARD. Property will stand a most rigid examination, and the best of inducements offered. Address

T. E. ROWAN,

Office Nos. 4 and 5 Bryson Block, LOS ANGELES.

COPPER.

SOUTH BISBEE COPPER MINING and TOWNSITE IMPROVEMENT CO.

Capital Stock, $5,000,000.

NON-ASSESSABLE.

A limited number of shares of the treasury stock are offered at TWENTY CENTS per share.

Applications for stock or copy of the prospectus can be had on application at company's office, No. 4 Bryson Block, Los Angeles, where samples of the ore can be seen and full information relative to the property obtained. T. E. ROWAN, Treasurer, or, H. W. LEWIS, Secretary.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal

M. CRAFFEY,

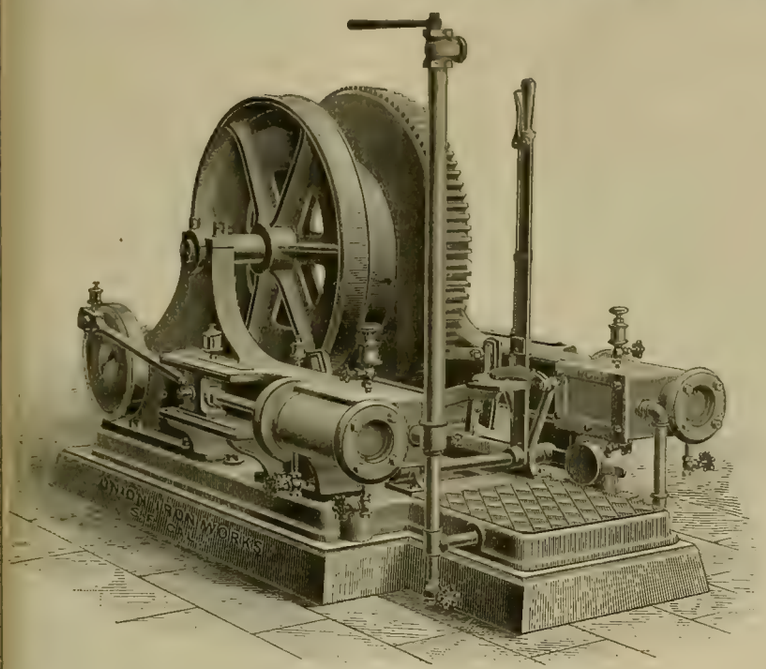
FOR PROSPECTORS.



A book written by a prospector, giving information on methods and appliances used by frontier miners. By mail, Twenty-five Cents, postpaid. Address "Prospector," Mining and Scientific Press office, 330 Market St., San Francisco.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

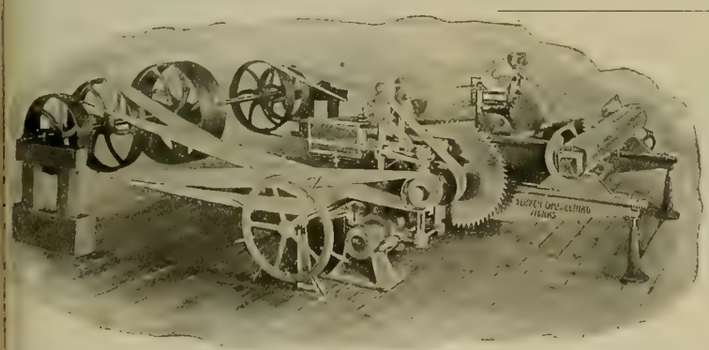
MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

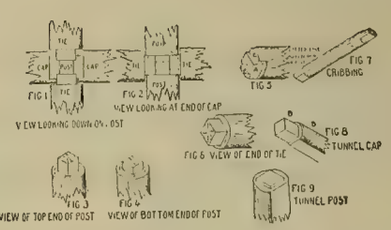
For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.



The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.



The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

PATENT

Mine Timber Framing Machine.

Will do the work of twenty carpenters and each timber will be an exact duplicate of the other.

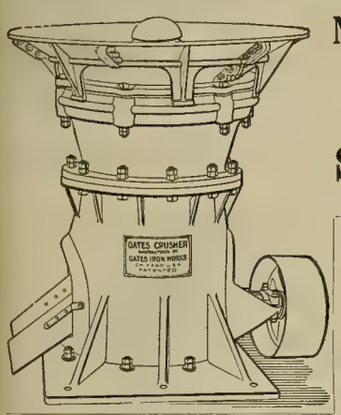
A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.



The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $5,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend itself to all mine owners and mill men.

The Pelton Water Wheel Company

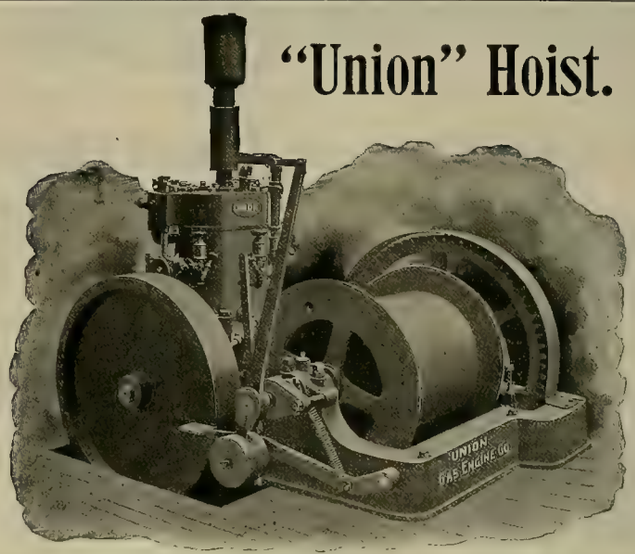
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

Market Reports.

The Markets.

SAN FRANCISCO, May 12, 1898.

Never in the history of this Pacific coast since the admission of California has war been of so local a nature or effect as at present. While the victory of Dewey at Manila freed the coast from all apprehension of Spanish invasion, the occupation of the Philippines made necessary American reinforcements, and there are now massed in this city 5000 soldiers, who next week will start for our new national acquisitions in the Orient. This has had a stimulating effect on nearly every line of production. As an instance, may be mentioned that to-day the Government placed purchasing orders in this city for one million rations; this, in connection with other purchases, has materially stiffened prices and aided local business. In general it is believed that the transfer of the Philippine Islands, which is certain to follow Admiral Dewey's victory, the opening up of China largely on the British principle of the "open door," together with the development of Japan, to say nothing of the possibilities in Samoa and Hawaii, indicate that the future will see a great expansion of trade with the far East. It is reasonable to suppose that, owing to its geographical location, as well as the commercial enterprise of its merchants, this section will receive a fair share of this new business. It seems likely that new and powerful aggregations of capital will be formed to master and control this business and that the development of our merchant marine has now an opportunity that needs only intelligent and sagacious action from the national legislature to assure it an enormous success. Meanwhile, the Pacific Mail Steamship Co. is destined to profit largely.

In coal yard prices on coast coal to dealers is: Wellington, $8; Seattle, $6.50; Coos Bay, $5.50; Southfield, $7.50.

Locally, metals are unchanged. A New York dispatch says: Lake copper, $12 bid and $12.15 asked; tin, $14.40 bid and $14.50 asked; spelter steady, $4.10 bid and $4.20 asked; lead easy, $3.60 bid and $3.65 asked. No change in the quotation of lead fixed by the firm naming the setting price for Western miners and smelters, the figure still being $3.50.

Quicksilver has advanced 50c per flask. The local jobbing price is $41.50.

Silver is quoted in New York at 57, bar; local, refined, per ounce, 1000 fine, spot, 57; London, 26¼d, 925 fine.

From Feb. 25th, '98, to last Tuesday, inclusive, this country imported in gold $72,292,350. San Francisco sent to New York City $14,983,721 in gold coin during the first four months of '98.

Mining Share Market.

SAN FRANCISCO, May 12, 1898.

"Dull and steady" was the opening of the week, with increased demand on Tuesday and good buying orders, weakening on Wednesday, with slight recovery to-day. The rehearing granted by the Supreme Court advanced Hale & Norcross. War and wheat transactions have, however, overshadowed all Stock Exchange operations during the week.

Plans for Comstock drainage in line with the system originally proposed by the MINING AND SCIENTIFIC PRESS are being figured on. The idea of Supt. W. E. Sharon is to organize "The Comstock Pumping Association," the cost of draining the mines down to the 3000 level from the Imperial to the Silver Hill to be borne jointly by all of the companies interested, the total cost of which he figures would not exceed $250,000. He proposes to sink the Forman shaft, now down 2700 feet, to the 3000 level, then run a drift to tap the water in the Belcher to admit of a volume flowing into the Forman shaft sufficient for the Reidler pumps placed there to lift to the Sutro tunnel level when operated at full capacity. The lifting capacity of these pumps will be 4,000,000 gallons in twenty-four hours—twice the amount required to handle the average volume flowing into the Gold Hill mines in that time; the pumps to be operated by electric motors, the power for driving to be obtained from either the water company or by wire transmission from the Truckee river. The total cost of the project above includes sinking the Forman shaft to the 3000 level and the full equipment of pumps and drainage.

A body of high-grade ore exists on the 2700 level of the Belcher and Crown Point, which was developed just before deep mining on the Comstock was suspended.

Virginia, Nevada, reports that the Chollar and Potosi Mining Companies have ratified the contract with the Comstock Tunnel Company whereby, together with the other companies composing the Brunswick Exploration Company they are to have the use of the Sutro tunnel for deeper explorations in their ground on the Brunswick lode, besides full title to that part of the ground through which the tunnel passes. The Chollar Mining Company is to pay $5700 in back royalties to the Comstock Tunnel Company for ore extracted from the Brunswick ground. The first installment of $1000 has already been paid, and other installments of $1000 each are to be paid every following sixty days until the whole amount is paid.

At the Alta mill last Thursday was completed a trial run of 320 tons of ore by the concentration and amalgamation method from which Supt. Boyle says there will be good results. The north intermediate drift, between the 940 and 825 levels, is out 42 feet in favorable-looking vein material carrying bunches of low-grade ore. They will sink a winze below the 940 level, where no work had been done before.

El Ubarbo Con. M. Co., San Francisco; capital stock $100,000, subscribed $25; D. McKay, L. L. Rosenthal, W. Lewis, M. Loudheimer, R. Barnett.

Tuolumne Con. M. Co., San Francisco; capital stock $500,000, subscribed $500; E. A. Wiltsee, H. McAllister, S. Hoffman, J. W. Lilienthal, A. Raymond.

Alaska P. & M. Co., San Francisco; capital stock $10,800, subscribed $7920; G. Goodman, J. Loftus, J. Faubel, C. Whybron, Z. O. Fields.

Commercial Paragraphs.

THE Link-Belt Machinery Co., Chicago, have recently established a branch office at 521 Seventeenth St., Denver, Colo., Mr. A. E. Lindrooth, engineer in charge, who will look after the company's interests in Colorado and adjacent States and Territories.

THE Colorado Iron Works Co., of Denver, Colo, received an order from the Tasmanian Smelting Co., Ltd., of Zeehan, Tasmania, for two 42x120-inch silver-lead smelting furnaces, including the necessary equipment for the operation of these furnaces. This order also calls for two complete sets of extra water jackets.

THE Simonds Saw Co., San Francisco, has put into the works of the National Ice Co., at the foot of 8th St., a Marsh air compressor for hoisting the ice from the tanks, which is a great improvement over the old method of hauling up ice by hand power; also at Soquel a hydrostatic pump which forces the water a distance of one-half mile and raises it a height of 600 feet vertically. The water is used for feeding boiler for French's sawmill, located at this height above the spring.

THE contract for an electric power transmission plant for the falls of Monte Alto and Tlainepantla rivers, near the City of Mexico, has been awarded to G. & O. Braniff & Co., representatives of the Westinghouse Electric and M'f'g. Co. in Mexico, for a sum approximating $1,000,000. The plant will be the largest and most important power transmission project ever contemplated in the republic. The power will be derived from three falls in the Monte Alto and three in the Tlainepantla rivers, whose power together amounts to about 6000 H. P. This will be transmitted to the City of Mexico from twenty 800 H. P. Westinghouse polyphase generators directly coupled to twenty water wheels. The current will be sent at a potential of 22,000 volts.

Books Received.

"*Gas, Gasoline and Oil Engines:*" Second edition; pp. 384; 270 engravings; designed for general information; treats of theory and practice of gas, gasoline, and oil engines, as designed and manufactured in the United States; with chapters on horseless vehicles, electric-lighting, marine propulsion, etc. N. W. Henley & Co., 132 Nassau street, New York. Price, $2.50.

"*The Designing of Cone Pulleys:*" A non-approximate, graphical solution for the problem of proportioning cone pulleys, with concise practical rules. W. K. Palmer, Lawrence, Kansas. Price, 50 cents.

Assessment Notices.

RED CAP MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of April, 1898, an assessment (No. 3) of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 125 Beale St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 27th day of June, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. H. MARTIN, Secretary.

Office—125 Beale St., San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of May, 1898, an assessment (No. 1) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 218 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 5th day of July, 1898, to pay the delinquent assessment, together with the costs costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—218 Jackson St., San Francisco, California.

DELINQUENT SALE NOTICE.

TUBER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Panamint District, Inyo County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 22nd day of March, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Zerah Castle	8	6,250	3 125 00
Hugh McDonnell	17	1,000	500 00
Hugh McDonnell	18	1,000	500 00
J. W. Pew, Trustee	74	12,484	6,242 00
Nat Stein, Trustee	75	8,317½	4,158 83
Nat Stein, Trustee	76	8,317½	4,158 83
Nat Stein, Trustee	77	14,500	7,250 00
W. Sheldon, Trustee	78	12,484	6,242 00
J. W. Pew, Trustee	79	18,733	9,366 50
Nat Stein, Trustee	80	16,749	8,374 50

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of March, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California, on THURSDAY, the 2nd day of June, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

STOCKHOLDERS' MEETING.

Notice is hereby given that the regular annual meeting of the NATIONAL CONSOLIDATED MINING COMPANY will be held at the office of the company, 916 Market Street, Rooms 56 and 57, in San Francisco, on MONDAY, the 6th day of June, 1898, at 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may properly come before the meeting.

By order of the Board of Directors.

G. W. FLEISSNER, Secretary.

San Francisco, May 12th, 1898.

La Sal Mountains.

NEW, RICH MINING DISTRICT.

Best reached by way of the

Rio Grande Western Railway

from CISCO or THOMPSONS stations.

Daily stage from Thompsons to Moab—here outfits can be secured at very reasonable rates—thence by wagon or saddle to LA SAL MOUNTAINS, twenty miles distant.

The formation is igneous and all the metamorphic rocks abound. Veins of quartz, quartzite, porphyry, granite and spar are well defined. The district promises a great future.

Send to F. A. WADLEIGH, Salt Lake City, for pamphlet.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

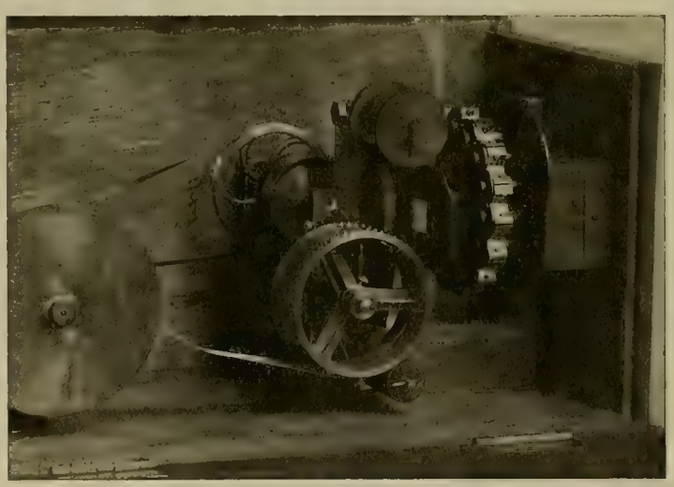
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1976.—VOLUME LXXVI. Number 21. SAN FRANCISCO, SATURDAY, MAY 21, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Pictures Endowed With Life.

On Saturday, May 7th, the Seventh Regiment, California Volunteers, marched past the MINING AND SCIENTIFIC PRESS office on their way to the Presidio, there to be sworn in and prepared for transportation to the Philippines with 7000 more troops to co-operate with Admiral Dewey. As they marched instantaneous photographs were taken, and on Monday, forty-eight hours after, an animated picture of the stirring scene was exhibited, thus illustrating one of the most wonderful achievements of practical science—the ability to swiftly and correctly reproduce one of the opening acts in the great drama of present war.

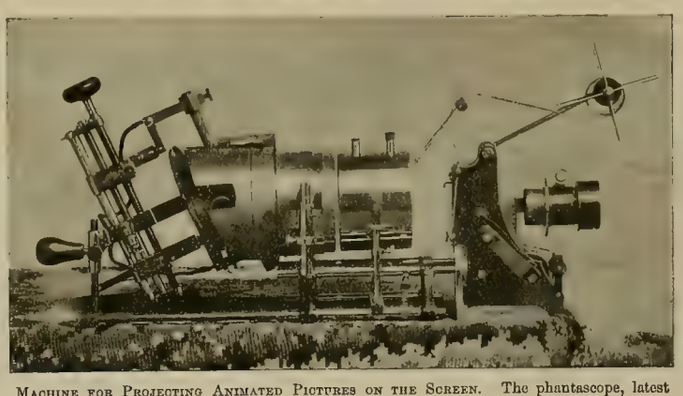


SECTION OF FILM (actual size). A squad of soldiers at drill.

As pointed out in a recent issue of Popular Science, a new and wonderful field in the realm of photography has lately been opened up to the world—a field whose extent, variety, and richness are as yet scarcely realized, though its assiduous cultivation by inventive minds has already afforded a harvest of interesting results. Aided by ingenious devices, the scientific photographers of to-day are enabled to portray motion in all its varied forms with a realism that impresses the beholder. They have, in effect, contrived to breathe life into normally changeless records of the camera; and the process is now applied, with marked success to animated scenes of the most diverse description. The busy traffic of city streets, the play of expression upon the human countenance, the movements of waves, waterfalls, fleeting clouds—these and many other effects have been depicted upon the screen with equal fidelity before audiences that have seldom failed to show their appreciation of the novel form of entertainment thus provided.

These striking productions of the photographic art will doubtless continue to attract the world's attention. They have already become a source of much instructive entertainment to the public; and their usefulness, from this point of view, must be recognized by all. But the invention has other and more serious claims upon our consideration. As a means of permanently recording and vividly illustrating notable events its importance will scarcely be overestimated. The ordinary photography can depict for us only isolated phases in the varied phenomena of life or Nature; though the value of its precise records, from the historian's standpoint, has of course received ample recognition. But the charm of animation may henceforth be added to our portrayals of historic scenes. And, in like manner, we shall be enabled to record the mutable expressions, the gestures and mannerisms, as well as the features, of distinguished men and women; while the value of all such records must increase with the lapse of time.

The subject may be regarded from two very distinct points of view. On the one hand, we are concerned with the ordinary animated pictures, whose properties and function are already known to the public; on the other, we have to deal with movements originally imperceptible to the eye, but which can be rendered visible upon a screen if the slow-moving bodies are photographed under conditions described in a subsequent part of this article. Pictures of this kind, may, for convenience, be spoken of as motion views of the second type. Such pictures have not, says J. M. Barr in the article quoted, been produced up to the present time. This aspect of the subject is interesting and merits careful investigation.



THE JENKINS CAMERA, with rotating system of lenses; capable, in sunlight, of taking one hundred pictures per second.

Although the kinetoscope and cinematograph are regarded as distinctively modern contrivances, it should be borne in mind that they represent only the recent development of a principle that has long been familiar to students of optical science. Though differing much in the details of their construction, these various machines are designed to fulfill the same general purpose—viz., the display in rapid sequence of a long series of photographs, which hence convey to the eye and brain the impression of a continuous and animated scene. In the kinetoscope the small pictures are viewed through an enlarging lens by reflected light, whereas in the cinematograph, plantascope, vitascope, etc., they are projected upon a screen—a plan that is obviously best suited to the requirements of a public exhibition.

AN APPROACHING TRAIN. Compare upper and lower views of the film.

A machine of the last-mentioned type may be shortly described as a stereopticon, combined with such mechanism as is requisite for the precise manipulation of the celluloid picture film. When the apparatus is set in motion the long band of celluloid passes quickly, though not continuously, behind the projecting lens, between spools or bobbins which revolve at [illegible] While thus passing from its original spool to the winding reel the film encounters certain pulleys and toothed rollers that serve to accurately direct its movements. Along its edges are numerous small perforations, into which the teeth of the rollers fit with precision; and by this means the small transparencies are made to occupy exactly similar posi-

MACHINE FOR PROJECTING ANIMATED PICTURES ON THE SCREEN. The phantascope, latest model, being an attachment for a J. B. Colt & Co. electric lantern.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

Moses Hallett; Yuba Power Company; Suspension of Mineral Assessments; Action of Heat on Carbon in Steel, 545. Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs, 558.

DISCUSSION of water jacketed furnaces from an Australian point of view, on page 539 recalls the recent death at Antioch, Cal., of M. W. Belshaw, a pioneer California miner, who is believed to have made at Cerro Gordo, Inyo Co., Cal., the first use of water jackets on furnaces, a device now in such universal favor.

NEVADA'S greatest mine, the De Lamar, Lincoln Co., is, it is rumored, about to be bought by "a British syndicate." The De Lamar is just about what would suit English investors. It is a big property, profitable and isolated and would cost considerable. The mine was recently examined and reported on by F. W. Bradley of San Francisco. After C. M. Rolker's examination it is believed the owners refused a foreign offer of $3,000,000.

MINERS are enlisting for U. S. service. In California Maj. Andrew Myers, an old army man, is organizing a battalion in Shasta Co., and this week Capt. H. P. Gordon, another miner, who served three years in the regular army, has undertaken to raise a company. Among the 7000 volunteers arriving from coast States at San Francisco during the month are many miners and prospectors who have temporarily dropped their tools to help the Government in the present conflict with Spain.

DEWEY'S Philippine victory means much to the Pacific coast. Rightly followed up it is a commercial signal. San Francisco and coast cities have complained of geographical condition, likening themselves to "the back doors" of the nation. Why not face about, realize and grasp the opportunity, and be the front doors! The commerce of the Pacific ocean may exceed in importance that of the Atlantic. The Nicaragua canal, the acquisition of Hawaii, the Philippines, the Siberian road, the partition of China, all point the course of destiny and the future of this part of the nation, which with 6 per cent of this nation's population already has 10 per cent of the national wealth.

THE Pacific Rolling Mills, one of San Francisco's largest industries, is about to close up its extensive business and retire. The reason assigned is lack of patronage. Some millions of dollars were invested in the home enterprise, which at one time was a profitable one. The bonded indebtedness aggregates $700,000, of which $200,000 bears 6% interest, and $500,000 5%. The hope is expressed in that time all the claims will be fully paid. President Neal is inclined to ascribe the failure to "Eastern competition." Post mortems are seldom salutary, but it is in order to observe that poor management, a narrow-gauge policy, and sole reliance on local pride will wreck any business concern of any kind. It is likewise evidence of inferior business sagacity to assume that the mere existence of a manufacturing institution in a place bestows the right to claim local patronage, more especially when with that claim is coupled the right to directly compete with those from whom it asks patronage and support. The facts are not lost sight of that high prices of labor and fuel, freight rates, limited industrial area, and active business competitors all formed a formidable combination, but it is thought that proper management would have continued to make the business a profitable one, and that the inability of the directors to carry it on is no just argument against the permanent cessation of such effort on this coast.

Geological and Mineralogical Surveys in California.

For years two organizations have been at work in California having for their final object the development of the mineral industry. Both of these, the State Mining Bureau and the United States Geological Survey, have been of much benefit to the State, but it has often been recognized that this benefit could be greatly augmented if the two organizations should work in unison, following up some comprehensive and rational plan. Each has gone its own way, regardless of what the other was doing, so that investigations have been duplicated or carried out in such a manner as to be much less productive of practical good than if cordial co-operation existed.

The basis of nearly all work which belongs to institutions of this kind has long been recognized by the United States Geological Survey as lying in good maps, and it has consequently gathered a number of trained men for its topographic work. As soon as possible the maps prepared by these men are placed in the hands of the geologists, to be used as a basis for their scientific and economic investigations. The ordinary map is practically useless for geologic work, and it has been found that for some purposes the maps of the Survey on the usual scale used could be improved. Upon the whole, however, the scale employed and the details placed upon the maps have been found to represent the best that could be done.

As the Survey has to divide up its funds among the different States progress is necessarily slow in individual localities. California has been given its share, for a very extensive survey has gone on through the main gold belt for a number of years. Many of the results of this work have not yet been published.

The State Mining Bureau has aimed to more directly aid the development of the mining industry but it has labored under many disadvantages, chief among which is the lack of good maps. Neither has it had the funds nor the men trained for topographic contour mapping. Several years ago a strong effort was made and nearly succeeded in inaugurating a movement for united work between the State and National Surveys for the more rapid extension of the topographic mapping which was being carried out by the U. S. Geological Survey alone. This plan was to eventually extend the maps to the whole State, the expense to be borne jointly by the State and and general government, and the State to have the plates for printing the maps at no extra expense. This excellent plan it is hoped may yet be carried out, for if once undertaken it is certain to give such satisfaction that its completion will be assured.

The contour maps of the U. S. Geological Survey have now been extended over a large part of the central and northern Sierra Nevadas. In addition a long strip extending from Santa Monica to San Bernardino has been mapped, and smaller areas near San Diego, San Luis Obispo, and about the bay of San Francisco. Almost all of these have been made upon the scale of one mile to the inch, and have proved valuable. The State is so large, however, that many important districts under the plan which has to be followed by the Survey must be left without any study for years to come unless the State does a part of the work.

The desire has often been expressed that the maps of the main gold belt prepared by the Survey might be made on a larger scale, made to include more data of direct value to the miners, that is maps on the plan of the Nevada City sheet. This plan would, however, involve such an enormous expense that it would be practically impossible for the present at least.

Director Walcott has shown himself desirous of doing all possible for the important mining districts of the State and has undertaken, at the solicitation of the mining men of Calaveras and Amador counties, a map of the mining regions of these two counties which shall be of more practical value than those already published, using as a basis the topographic sheets and placing on them all mining claims, section corners, etc. This course has given great satisfaction and it is hoped that it can be extended.

The most important recent work of the Mining Bureau has been the preparation of a register of mines, which it hopes to make complete in every respect. This work is also good as far as it goes, and is much appreciated by all interested in mining.

Since the organization of the Mining Bureau, field work has been handicapped by the lack of suitable maps for portraying the geology and the economic features dependent upon it. All men who have had practical experience in the field, whether as miners or as geologists, recognize the fact that the work of the best of men is rendered almost useless through lack of maps. But one recent opportunity has arisen in which the Bureau has been enabled to make use of the topographical maps of the Survey, viz., at San Luis Obispo, where an area of nearly 600 square miles had been surveyed. The State Mining Bureau dropped this, however, before it was completed, and it was carried to a termination under the auspices of the U. S. Geological Survey. It will appear as a folio, being the first one completed on the Coast Range, and has given satisfaction to the people of the locality.

The State is not prepared to do the mapping that the topographic division of the U. S. Geological Survey has been carrying out. No State in the Union pretends to do much of this sort of work by itself. Because of a disinclination to co-operate with the Survey we have all along been doing economic work under great disadvantages as to time, money and accuracy.

It can be said with some assurance that any reasonable proposition in regard to co-operation between the State and the Survey would be seriously considered by Director Walcott and arrangements similar to those in other States could probably be made, particularly in regard to mapping, and if thought best possibly along other lines. Some comprehensive and rational plan once agreed upon, the work could be extended over the State much faster than by the Survey alone or by the Mining Bureau alone. Many important mining districts could be mapped in the near future which, under present conditions, would be and must be neglected for years. Under such an arrangement the Mining Bureau would then be prepared with maps upon which it could locate with as much detail to geologic and economic features as individual districts required for their full development. It is also probable that, under some joint plan, much of the main gold belt could be furnished with more detailed maps than the U. S. Geological Survey alone has prepared or would feel justified in preparing, considering its province as a national organization.

We do not counsel merging the Mining Bureau in the Survey, believing in the State doing its own work as far as possible. It is legitimate to cultivate State pride and endeavor along lines which appear feasible to do as good work as can be done anywhere, and California has men who can do such work. We ought to maintain a State Museum in which are represented thoroughly the rocks and minerals occurring within its borders. If the State attempts no geological or mineralogical investigations, but leaves that part to the Government, we would have nothing at home to represent our mineral wealth; all the collections would go to Washington, far removed from those most practically interested.

It would seem that within proper limits it would

be common sense policy to have the work of the two organizations harmonious. The State might leave to the U. S. Survey what the latter can do to best advantage, and, at the same time, through co-operation, be enabled to prepare and distribute to those interested in mining much information which under separate and conflicting work would remain unavailable. It is thought that, no matter how valuable much of the work which the Mining Bureau may plan to carry out, existing conditions make it difficult or impossible to accomplish it to good advantage; and this may be said without any reflection upon the State institution.

A systematic course of mapping, the State and the U. S. Survey working together, extending from the important centers outward, with the intention of covering finally the whole State; these maps to be used as a basis for the study of mineral deposits in detail by the State in sections where the U. S. Survey cannot spend the money, and in conjunction with the Survey in other areas resulting in more detailed work than either alone could undertake, would certainly be productive of excellent results.

This matter is worth discussion through the columns of the MINING AND SCIENTIFIC PRESS, or any other practical way, to have opinions on different sides of the question, for and against, presented, and the reason therefor given, that the feeling of mining men may take some tangible shape.

Some Questions Answered.

Three weeks ago Mariposa county, Cal., residents asked: "Is the Yosemite reservation open for prospecting and mining?" This was referred to the Commissioner of the General Land Office. Under date of May 10, he writes from Washington, D. C.:

The Act of June 4, 1897, related entirely to reservations created by proclamation under the Act of March 3, 1891 (26 Stats., 1095). Said Act of June 4, 1897, suspended the Executive orders and proclamations dated Feb. 22, 1897, empowered the President to revoke, modify or suspend any and all such Executive orders and proclamations as he shall deem best for the public service and provided "that mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States and of the rules and regulations applying thereto, shall continue to be subject to such location and entry notwithstanding any provisions herein contained."

The circular of June 30, 1897, was issued to carry into effect the provisions of June 4, 1897. The Act of Oct. 1, 1890 (20 Stats., 650), by which the lands in the Yosemite National Park were withdrawn from settlement and sale and set apart as reserved forest lands, was not repealed, modified nor in any way affected by the Act of March 3, 1891, or the Act of June 4, 1897. Therefore, the rule as to lands in said reservation still prevails that miners and prospectors can acquire no rights to mineral lands in said reservation except to perfect a claim included in a valid location which was made prior to the Act of Oct. 1, 1890, and which claim has not since been abandoned. (See Yosemite National Park, 25 L. D., 48). Very respectfully,

BINGER HERMANN.

This authoritatively answers the question in the negative.

The question simultaneously received from Idaho, Colorado, California and Utah: "Are prospecting and mining permitted within Government forest reserves?" is best answered by quoting in full the Act of June 4, 1897, referred to above in Commissioner Hermann's letter:

The Secretary of the Interior may permit, under regulations to be prescribed by him, the use of timber and stone found upon such reservations, free of charge, by bona fide settlers, miners, residents and prospectors for minerals, firewood, fencing, buildings, mining, prospecting and other domestic purposes, as may be needed by such persons for such purposes.

Nor shall anything herein prohibit any person entering upon such forest reservations for all proper and lawful purposes, including that of prospecting, locating and developing the mineral resources thereof; *provided*, that such persons comply with the rules and regulations covering such forest regulations.

All waters on such reservations may be used for domestic, mining, milling or irrigation purposes, under the laws of the States wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established thereunder.

Upon the recommendation of the Secretary of the Interior, with the approval of the President, after sixty days' notice thereof in the State or Territory wherein any forest reservation is situated, and near the said reservation, which after due examination by personal inspection of a competent person appointed for that purpose by the Secretary of the Interior, shall be found better adapted for mining or agricultural purposes than for forest usage, may be restored to the public domain. And any mineral lands in any forest reservation which have been or which may be shown to be such and subject to entry under the existing mining laws of the United States and the rules and regulations applying thereto, shall continue to be subject to such location and entry, notwithstanding any provisions herein contained.

On June 30, 1897, the Secretary of the Interior issued rules and regulations in conformity with the foregoing, authorizing and permitting the removal of timber, as prescribed in the first section above quoted.

Gypsum is a "mineral," under the mining law, and can be located in the same general manner as a placer claim—20 acres.

Pictures Endowed With Life.

(*Continued from page 533.*)

tions when their images are projected upon the canvas. As each picture in its turn attains this critical position, it is momentarily brought to a standstill. At the same time a shutter* is opened and an image of the picture flashes for an instant upon the screen. The shutter is then quickly closed, the picture resuming its motion, while its successor in the series is brought into a similar fixed position.

This temporary stoppage of the film (or of a portion thereof), as each picture attains its proper place behind the projecting lens, is a very essential feature of the process. Let us assume that a picture has arrived at the fixed position already referred to. At the instant of its arrival, a portion of the film on the preceding side of the picture will be in an unstrained or slack position. The "slack" is then taken up by a continuously moving sprocket pulley, whereupon a rod or roller is quickly brought to bear against the now tightened film, pressing it to one side and as quickly releasing it. By this movement the next picture is pulled into its fixed position, while the film is made taut (or nearly so) on the following side of this picture. These operations are repeated continuously until the entire film has passed through the holding device in rear of the lens. The process may be compared, in a general way, with the automatic feeding of a web of paper to an ordinary printing press.

A specially constructed camera is used in taking the negatives from which ultimately motion pictures are obtained. The picture roll is replaced by a reel of sensitized film, upon which the exposures are made in quick succession when the apparatus is set in motion. From twenty-five to fifty photographs are thus "laid on" in a second of time. The films range in length from fifty to two hundred feet, and contain when finished from eight hundred to more than three thousand tiny negatives. After exposure the film is subjected to the usual photographic operations. These are, however, conducted with special arrangements, rendered necessary by the inordinate length of the film. The latter is subsequently made to pass, in contact with a second sensitized film beneath an incandescent lamp, whereby the photographs are impressed or "printed" upon the sensitive surface. This second film in its turn is passed through the various photographic processes. When complete, it is wound upon a spool, and is then ready to be placed in the cinematograph or other machine used in exhibiting the pictures. Here, as already stated, the mechanical arrangements correspond to those employed in taking the negatives. Thus the pictures when displayed before an audience, are seen to flash out in the same rapid sequence in which the original scenes were presented to the "eye of the camera."

A homely illustration may aid the reader in arriving at a perfectly clear comprehension of the subject. Let us take the case of a man who is slowly walking past a high picket fence and gazing intently at some moving object on the other side of the fence. His view will be interrupted at regular intervals by the pickets as they successively encounter his sight. But if he proceed more quickly a seemingly continuous view of the object in question will be obtained, though rapid alterations in its brightness will be manifested. These effects are due to a well-known cause, viz., the persistence of luminous impressions upon the human retina. Thus, our observer's eye retains for a brief period its impressions of each momentary glimpse that is afforded him under the conditions just described; and the successive visual images become merged into one another, while the rapid fading of these retinal impressions gives rise to the pulsating effect that is familiar to everybody.

The well-known optical phenomena described are closely analogous to those exhibited by the animated pictures. In the former case we have to deal with a moving body; in the latter, with photographs of such bodies; and since the momentary images in the first-mentioned case are practically changeless it is evident that a similar general effect must be produced upon the organ of vision.

We have hitherto been concerned with motion pictures of the ordinary type—those, namely, which reproduce with accuracy the movements of the original scenes. In order to secure this result it is essential that our pictures be "taken" and exhibited at the same rate per unit of time. Where this condition has not been fulfilled, it is manifest that the pictured objects must appear to move either quicker or more slowly than their originals. If the difference in rate be small, its results will hardly be noticeable; if large, a curious but awkward and unnatural effect will be produced. Suppose the mechanism of our camera to be altered in such wise that successive exposures may be made at relatively long intervals of time, while the duration of each exposure can be varied at will. With this end in view the camera should be provided with clockwork capable of running for twenty-four hours continuously. Thus equipped we should be ready to experiment on objects—such as growing plants—whose changes are of too gradual a nature to be perceived by the eye.

If, for example, our pictures were taken at half-hourly intervals and shown at a speed of fifty per second, the apparent rate of growth of the plant would be increased no less than ninety thousand times. A slower rate would evidently correspond to a diminished time interval between successive negatives; and this interval should in all cases be so chosen as to insure gradual (though distinctly perceptible) changes in the resulting pictures.

Such views could not fail to produce an effect at once marvelous, unique, and instructive. As pictured upon the canvas, the plants would grow and develop before the eyes of the onlookers, throwing out leaf upon leaf, and visibly increasing their dimensions. Here and there a flower or flower cluster might make its appearance, the individual blossoms bursting forth suddenly and remaining visible for a brief period only. The process is clearly applicable to greenhouse or indoor plants of every description, from stately palms or tree ferns down to the most delicate mosses or lichens. Thus, the general phenomena of plant growth may be illustrated with a vividness never before realized.

In dealing with subjects of this nature we must take into account the inevitable deterioration of the sensitive films through lapse of time. It will become necessary, in fact, to use shorter films whenever the negative series is much prolonged. Such films could be treated separately, and afterward joined together so as to form one long strip—a procedure involving only a little care and the use of some celluloid solution. From this composite negative film a single uniform roll of pictures would ultimately be obtained by the usual process.

The application of this method to outdoor objects will in general be greatly restricted, owing in part to the variable light and partly also to the influence of wind and weather. Some picturesque effects could, however, be obtained by photographing natural scenery under varying angles of illumination—especially in mountainous regions and near the time of sunrise or sunset, when the most striking changes would be manifested. Seasonal variations, too, might be illustrated by depicting scenery in a forest from day to day for months in succession.

Turning from the earth to the heavens, we shall see that similar methods are applicable to the most prominent of celestial bodies, viz: the sun. The photographic art has long since been applied with conspicuous success to the glowing solar disk, with its dark spots and brighter patches or "faculæ"; and such photographs are now taken from day to day at leading observatories in various parts of the globe. During recent years, moreover, astronomers have contrived to photograph, under conditions, the surroundings of the great luminary—including the chromosphere and prominences, but excepting the corona, which can not as yet be studied in the absence of an eclipse.

The realism of our motion pictures may also be enhanced by imparting to them the quality of relief, as in the stereoscope. We may utilize for this purpose as the lantern stereoscope, whereby stero views can be shown upon a screen, the pictures being viewed through instruments resembling opera glasses in external appearances. It will be possible in this way to exhibit animated views of every description in distinct stereoscopic relief. Each member of the audience must, of course, be provided with one of the binocular instruments referred to; and it is almost needless to add that the projecting machine, as also the camera used in taking the stereo negatives, must be of duplicate construction.

The phonograph, or grapohone, has frequently been used in combination with machines for the production of motion views. By such means Edison hoped to reproduce the sounds accompanying many scenes with such perfection that it would be possible to represent, for example, the complete performance of a drama with all its accessories. Up to the present time, however, these anticipations have not been realized.

*In some forms of apparatus, such as the vitascope and phantascope, the shutter is omitted. The intermittent motion of the film does not seem to mar the continuity of the pictures, which are also more fully illuminated in the absence of a shutter.

Copper Mining in California.

The great profit in present production of copper has directed renewed attention to the copper properties of California, several of which have been described in these columns. The leading copper property is that of the Mountain Copper Co. at Keswick, Cal., which in '97 produced 13,129 tons. Near Kennett, in the same county, the Mammoth has also a good copper belt. At Spenceville, in Nevada Co., as noted in last week's issue, are important copper deposits.

In Calaveras Co. the old and well-known Copperopolis properties are not in present operation. Supt. G. McM. Ross of the Union and Keystone contemplates resumption as soon as pending arrangements are completed.

Capt. H. A. Brainard of San Jose, Cal., who recently visited the Copperopolis properties, thus describes them:

"The copper ores are found in slate rock and consist of copper sulphides or pyrites mixed with iron sulphides. The mines have been worked a depth of 600 feet, but the ore which first attracted attention lay quite near the surface and was so rich that it could be shipped to the copper refiners without treatment.

"The ores as they come from the mine are divided into two classes, the high and the low-grade ores, the former going direct to the smelting furnace and the latter being either concentrated or treated in another way.

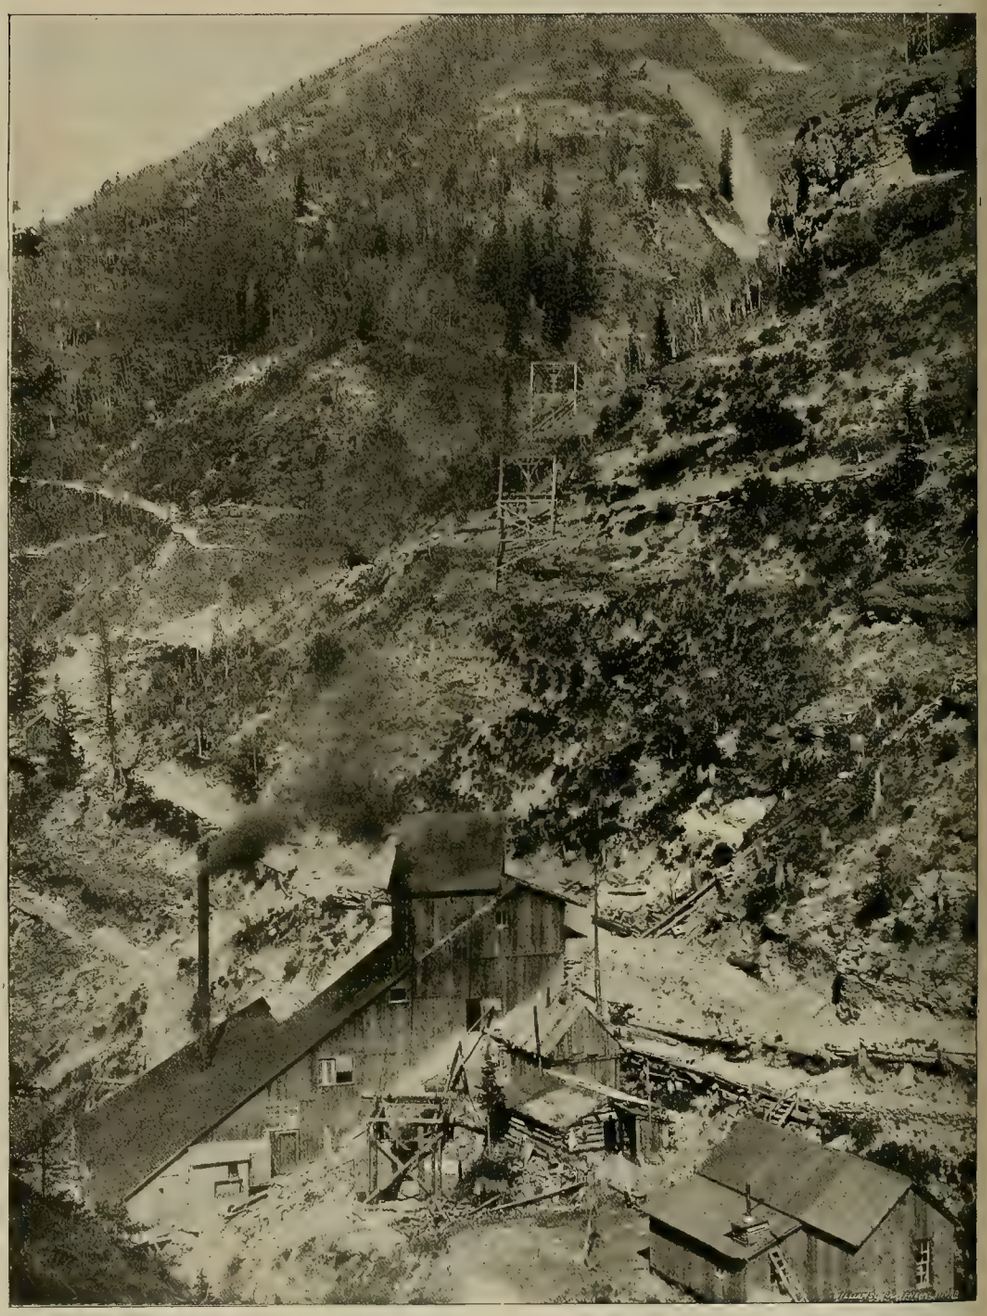
"To concentrate the ores they are broken into small pieces in a breaker, and by treatment in water the rich sulphides are separated from the worthless slate and the mass to be treated greatly reduced in bulk.

"The lower grades of the ore are first roasted, which is done by first placing a layer of wood and brush on specially prepared ground and depositing the ore from the mines on this until many thousands of tons have thus been piled. Then the fuel is lighted and begins to burn, and when a certain heat has been attained the sulphur in the ore also burns and makes additional heat. For the low-grade ores the plan is to burn slowly and at a low heat, not alone driving off the sulphur, but changing it first into sulphurous acid, and a part of it still further changed into sulphuric acid, and the sulphide of copper into a sulphate, while the iron is oxidized. After the ore is thus roasted it is placed upon the leaching ground, which is prepared by grading and covering with boards and canvas covered with asphaltum, with a series of flumes or troughs along the lower edge.

"At the leaching ground of the Union copper mine we saw a pile of 45,000 tons of this roasted copper ore. To the top of this great pile water is conducted which dissolves the sulphate of copper as it is formed, and as this process is continually going on, the leaching of this pile of ore may go on for years and years, with no apparent diminution of the amaunt of copper sulphate, or bluestone which is thus obtained in solution. This solution is conducted to great vats, from which it is drawn for further treatment.

"This treatment consists of filling long troughs or flumes with thin scraps of iron, vast quantities of tinned iron which remain after the manufacture of fruit cans being used for this purpose. Carloads of this material are furnished from San Jose. Through these flumes of scrap iron the copper solution slowly and steadily flows, and as soon as it touches the iron a remarkable chemical change takes place. The sulphuric acid of the solution passes to the iron and unites with it, making iron sulphate which at once dissolves in the water and passes away, while the copper in a metallic state is deposited in the place of the iron which is dissolved away. Soon the iron is all gone, and in its place the precipitated copper. By continued raking and stirring these flumes, the copper is obtained in the form of a very fine powder and is known at the works as 'copper cement.' When this is dried and screened it is placed in double sacks and sold, being used as a paint on the bottoms of ships to prevent their becoming foul with vegetable or low animal growths. Copper nails must be used in the construction of these flumes, and all structures coming in contact with the copper solution, as iron ones would be speedily destroyed.

"The higher grade of the ore is placed in piles and roasted the same as the other, except that in this case the fires are allowed to become hotter, and the sulphur instead of being changed or prepared to be changed into sulphuric acid, is driven away, and the iron highly oxidized. The ore thus roasted is placed in the furnace, and if it does not contain sufficient silicious matter to properly flux the iron oxide, some quartz rock and some limestone are added, but Mr. Ross has generally been able to select his ores and to so proportion them that no additional material is required. Coke is used as a fuel, and, as the mass melts, it is drawn off into settling basins formed of firebrick, when the melted copper sulphide goes to the bottom, and the fluxed iron oxide rises to the top, and each is drawn into proper receptacles, the iron slag being dumped like melted lava on the slag pile, when it becomes a solid mass, while the copper, now called 'copper matte,' is cooled and crushed, placed in coarse sacks and sent to the copper refiner. This matte contains about 50 per cent of copper, while the ore as it comes from the mines contains only from 10 to 12 per cent. We saw a pile of 5000 tons of copper ore, all piled for roasting, and the samples showed that it contained 11 per cent of copper."



In southern California, between Daggett and Randsburg, in San Bernardino county, the *Journal of Commerce* reports that some copper deposits have been acquired by Eastern men who have begun development work. They are owned by the Pacific Copper Alliance of New York and the United Yucca Copper Mining Company, while a third corporation is being organized in Boston to co-operate. The deposit is a belt two miles broad by twenty-eight long, in which have been located 133 claims. The ore runs, on an average, 17 per cent copper, with $11 in gold and $13 in silver to the ton. The companies are credited with intention to build a 100 ton smelter for the reduction of the ores.

Development has begun very recently upon a number of promising copper properties in San Bernardino county which are owned by people who have not sufficient capital to give them proper showing. Near Manvel, and also near Vanderbilt, are several claims which are reported rich.

In connection with this subject, D. Houston & Co. of N. Y. City write: Europe keeps up a constant demand for copper, where consumption goes on at an enormous rate, and this country is expected to supply the great bulk of what is needed. As an article of commerce copper ranks of great importance. Exports of this metal from the United States during the past two years amounted in value to more than $62,000,000, and yet the trade is carried on with the smallest reserve of foreign stocks known. With European visible copper supplies reduced to the equivalent of only a few weeks' requirements at the most, the urgency of frequent and heavy shipments from this country is palpable. The consumption of copper in England and France for the first three months of this year is estimated at 67,238,080 pounds, and that of Germany for the first two months at 21,963,200 pounds. This is at the rate of fully 400,000,000 pounds consumption per annum for the three countries named. Such a tremendous European demand, in conjunction with the growing domestic consumption, indicates the degree of pressure that will fall upon American copper mines to furnish an output partially adequate to meet the gigantic transatlantic requirements, in addition to the home demand.

The Valley View Mill, Colo.

The Valley View, near the Smuggler-Union properties in Marshall basin, near Telluride, Colo., is locally reported to be among the best paying gold propositions, to the extent it is worked, in the district. A year ago the 10-stamp mill on Marshall creek was connected with the mines by a two-bucket, aerial, gravity tramway, 2007 feet in length, said to be the most automatic in operation of any tramway in the county, the labor and attention of only one man being required to operate it. The mill treats twenty-five tons of free-milling gold ore daily. The pay streak of the lead varies from 10 inches to 5 feet in width and runs from $15 to $20 per ton.

VALLEY VIEW MILL, COLORADO.
Near the top of the picture the white dumps of the mill show plainly.

LESSEES have developed many prospects into mines. A live lessee is better than a dead ownership. One brings profit, the other loss. The lessee at his own expense finds out if you have a mine or only a hole in the ground. You can afford to be lib-

eral with the man who gives you this information.—Colorado Springs, Colo., Telegraph.

Montana's Mineral Output.

From E. B. Braden, in charge of the Helena, Montana, assay office, are received advance sheets of his report of the mineral output of that State. He says:

The precious metal output of Montana during 1897 was the largest in the history of the State, and aggregated $53,954,675.03. This is $3,222,576.90 more than that of the preceding year. The total production was contained in the four metals, gold, silver, copper and lead. The quantities and values of each are shown for these two years in the table below:

Metals.	Customary measures.	1896. Quantity.	Value.
Gold	Fine ounces	211,914.961	$ 4,380,671.00
Silver	Fine ounces	15,720,022.44	*20,324,877.49
Copper	Fine pounds	232,096,483	25,356,540.77
Lead	Fine pounds	22,521,340	670,009.87
Total			$50,732,099.13

Metals.	Customary measures.	1897. Quantity.	Value.
Gold	Fine ounces	217,514.846	$ 4,496,430.92
Silver	Fine ounces	16,307,346.00	*21,730,710.03
Copper	Fine pounds	237,158,540	26,798,915.02
Lead	Fine pounds	25,704,974	928,619.06
Total			$53,954,675.03

*Coinage value.

The mountains and streams of Montana have yielded $750,000,000 of precious metals to the wealth of the world since the advent of those pioneers whose arrival was almost coincident with the discovery of gold in 1862.

In Montana gold is obtained either from the auriferous gravels of placer mines or from veins or lodes and by one of the following methods:

By smelting ore from the veins or lodes.

By milling, amalgamation and concentration, together with cyaniding of quartz ores.

By placer, hydraulic mining or dredging of gravels.

The smelting products from lodes and veins comprised those generally classed as copper, lead and dry ores. The gold derived from this source was 107,967.374 fine ounces, or $2,231,883.72, equivalent to 49.64 per cent of the entire gold yield of the State. The gain for 1897 in this class of ore amounted to 11,146 958 fine ounces, or $230,428.11.

During 1897 there was a decrease of 6695.044 fine ounces, or $138,398.33, in the production of mill bullion over that of the previous year. The proportion obtained by mills to the total yield of gold in the State was 35 per cent. This decrease has a partial explanation in the fact that the mills of the Montana Mining Co., Limited (Drum Lummon mine), at Marysville, were idle until May 1st, pending exploration of ore bodies in the mine. As the figures include the product from cyanide plants, there was still a small decrease beyond that explained in the shutting down of the Montana Co.'s mills. The output of this company from their cyanide plant during the later part of the season in a measure also affects the decreased output from their gold mills.

The extraction of refractory gold and silver values from tailings and ores by the "cyanide process" was undertaken in Montana last year on a large scale. As the cost is small, it will be adopted widely among many properties in which the ores have not been susceptible of treatment by the former and more expensive methods. A general introduction of this process will acquaint men with its methods and largely increase the production of precious metals. The amounts recovered from tailings and ores by cyanide during the year were 9993.117 fine ounces of gold and 33,937.50 fine ounces of silver, valued at $206,576.06 and $43,878.79 (coinage value), respectively. In this process cyanide of potassium is employed in dilute solution as a solvent for the gold and silver contained in the material under treatment. The values are then precipitated preparatory to refining.

The output of gold from placers during 1897 was 33,418.923 fine ounces, or $690,830.43. The increase over 1896 was a small one. The year 1896 had been a favorable one for placer mining, but the miners report 1897 to have been a "short season for water." This was due to the quick and early melting of the mountain snows, and to a scarcity of spring rains. It was expected, therefore, that the figures for 1897 would show a decreased output from the placers as compared with those of the previous year. However, the introduction and successful operation of machines, or dredges, effected an increase and inaugurated a new era in the history of Montana placer mining.

Since Marshall's discovery of gold in 1848, the profitable working of auriferous gravel has been accomplished only under the most favorable conditions, principal among which have been water and a fall in the ground attacked to permit of the disposal of the debris after sluicing. The ground included in river beds and streams, in numerous gulches where sufficient water was not available, and in large and comparatively level areas in valleys and gulches, comprise a large proportion of the auriferous deposits, and have baffled all past attempts to work profitably. Many of these gravels have been thoroughly prospected and are known to contain gold in paying quantities. It is to these conditions that miner, inventor and investor of late years have turned their attention in hope of finding some method to recover this gold. The present dredges have been the outcome, and, while they may not be adapted to all conditions, it is believed that they may be modified to meet many of the requirements now existing. These machines handle the gravel preparatory to a washing in sluice boxes with a minimum of water. They are of two types and are designated as floating and traction. These dredges have been successfully operated in Beaverhead, Deer Lodge and Madison counties.

The increase of more than a million ounces in the output of silver is wholly attributable to copper mining in Silver Bow county, where about two-thirds of the entire yield of silver occurs as a "by-product." By this term it is meant that the metal is not present in sufficient quantities to make mining and reduction profitable, were it the sole product. The silver, as well as the gold "by-product," is of great value and is an appreciable gain in the marketable output from these mines. The increased production of these copper ores during the year, some of which carried higher values in silver to the ton, explains this increase.

Silver mining, as an industry in Montana, continues to decrease in importance. With the exception of the silver properties at Elkhorn, Castle and Neihart, and the Hope mine at Philipsburg, all of the famous silver producing mines of former years are idle. However, negotiations are reported between the companies interested looking to a consolidation of the Granite Mountain and the Bi-Metallic mines at Philipsburg into one corporation. Owing to the low price of silver, the operation of these properties under separate managements has been found unprofitable. The object, therefore, will be to minimize the cost of separate management, office hire and superintendence, as well as milling and mining, by consolidation into one company, and thus enable a profit to be realized. If effected, this will add materially to the future yield of silver, as the ore bodies are extensive and the past production of this metal has been enormous. The resumption of these mines will be watched with eagerness by the owners of silver properties, and, if profitable, may encourage consolidation and economical management in other instances that will be beneficial to the industry.

Montana produced 237,158,540 fine pounds of copper in 1897, which is equivalent to 50.22 per cent of the entire output of 472,225,600 fine pounds by the United States last year. Copper mining is, therefore, the most important branch of the precious metal production in Montana. Almost the entire product is from the Butte district, which has produced $383,086,779.07 in gold, silver, copper and lead during the last fifteen years. This exceeds that of any other locality of a like area in the world during the same period.

While lead mining in Montana has been the least important branch in the mining industry, the increase made during 1897 is proportionally greater than that shown in any other. To appreciate this, it is necessary to consider the closing down early in the year of the Iron mountain mine in Missoula county. This property was then the largest lead producer in Montana. The improvement made in the production of Meagher, Broadwater, Flathead and Cascade counties is therefore greater than would appear in the comparison of aggregates for the entire State. The gold and silver occurring as a "by-product" also adds a large amount to the output of lead mines and should be considered in an estimate of the actual advance made in this branch.

It will require the construction of many additional plants for the treatment of gold ores to admit of the development of gold mining in Nevada State to the old volume of silver mining. Considerable is being done in that direction and the gold output is increasing, which compensates for the decline of stock mining.

A Calaveras Co., Cal., "Prospect."*

At the South Paloma prospect an old tunnel was driven many years ago into the hillside. Ore was obtained, but not in sufficient quantities, and of too low grade a character to pay at that period. When the present company took hold of it in 1895, very little work had been done except this prospect tunnel. It is fair to state that unless the Gwin had successfully reopened, the shaft would never have been sunk on the South Paloma. With systematic development the company has carried the prospect shaft 700 feet in depth, and is drifting at that level. The South Paloma prospecting plant is very complete and economical, and consists of a steam 35 H. P. hoist, shop and outbuildings, representing the first step toward the making of a great mine. The shaft is 5x7 in the clear and timbered every 5 feet with 12x12 Oregon pine timbers. The gallows frame is 35 feet high, also of 12x12 timbers. The hoist has a capacity of 1200 feet. About $26,000 has been expended in equipping and sinking the mine to the 700 foot level and drifting at two levels. In this class of work the main expense is in the shaft sinking; but when once the shaft is sunk and drifts run on the ore, the profits can be calculated with as much regularity as the interest upon 6 per cent bonds. The cost of the shaft sinking depends upon the size of the excavation, nature of the country rock through which the shaft is sunk and the amount of water encountered. The shaft at the South Paloma prospect was sunk at an extremely low figure, all the conditions being favorable. Comparatively small quanti-

ties of water were encountered in sinking and the slate was easy to break.

A detailed average cost of sinking per foot is presented as follows, taken from the superintendent's record:

	Per foot.
Labor	$ 8 00
Lights	15
Powder	50
Management	2 00
Top labor	2 35
Timbering	2 00
Total per sinking foot	$15 00

Cyanide, Chlorination and Amalgamation in Colorado.*

R. B. TURNER.

Cyanide.—The Cripple Creek district has been one of the best in the State for the treatment of its ores by the cyanide process, and has five mills: The Colorado Ore Reduction Co., Elkton, chlorination 50 tons, cyanide 60 tons per day; the Brodie Gold Reduction Co., Mound City, cyanide, 100 tons per day; the Metallic Extraction Co., Cyanide, cyanide, 400 tons per day; the American Reduction Co., Florence, cyanide, 50 tons per day; the London, Florence, cyanide, 50 tons per day.

As all the above mills are custom plants, it becomes necessary to sample the ores in a well equipped sampling works, so as to establish their values for purchasing purposes before going to the fine crushing department of the mill. Therefore, all the Cripple Creek mills have their own sampling department and storage bins ahead of the cyanide mills, and ores are held until satisfactory settlements are made.

From the samplers' storage bins the ore, which has been crushed to ½-inch size, is drawn into cars and trammed to the automatic feeders of the revolving dryers. After passing through the dryers the ore is elevated to the sizing screens; the oversize from the screens passes to the fine crushing rolls, and, after passing through the rolls, the ore is screened and the oversize returned and screened until all passes through the screens and is conveyed to the finishing pulp bins. Considerable care is given to the crushing of the ore, so as to produce as granular a product as possible for the leaching tanks, and a number of dust appliances are now in use to collect the dust that is made in fine dry crushing.

The Cripple Creek oxidized ores are treated without roasting, but the sulphide and telluride ores require it; therefore some type of mechanical roasting furnace is used. It has been a serious question to decide between the merits of the roasters in use, which are the Ropp, Pearce, Turrett, Argal and Improved Buckner, as all are capable of doing the work required in ores of this district, that is, reducing sulphur from 3 per cent to less than two-tenths of 1 per cent.

At the present time only two mills in the district cool the roasted ore automatically. The Metallic Extraction Co., at Cyanide, uses a scraping conveyor which scrapes the ores over a water jacket bottom. The same style is in use at the Colorado Ore Reduction Co.'s mill at Elkton. The same leaching department is used for either class of ore, raw or roasted.

The leaching tanks are generally made of $\frac{3}{16}$-inch steel plates, and are from 20 to 50 feet in diameter, and from 4 to 6 feet in depth. In each leach tank a false bottom, or filter bed, is made to suit the fancy of the man in charge. The style of piping and arranging the solution tanks, storage tanks and precipitating boxes is governed by location of plant as regards ground and engineer having plant under construction.

The following items give an idea of what is needed in the cyanide department of a mill: Standardizing tanks, leach tanks, gold solution tanks, zinc boxes, sump tanks, vacuum tanks with vacuum gauge, ejector or vacuum pump, solution pump, necessary piping and valve, vacuum slime filter, zinc lathe, muffle and bullion furnace, and a number of small items too numerous to mention.

The ore after being properly crushed and roasted, if necessary, is placed in the leaching tanks, and a weak cyanide solution is added, either from the bottom or top, and allowed to saturate the pulp and rise above the top about 1 inch. The time this solution is allowed to remain before drawing away and a continuous circulation started is governed by the treatment found necessary to obtain the quickest results on the particular ore in question. After the leach has been completed, washing of the pulp becomes necessary. This generally consists of about three washes. The quantity of water required for this purpose should be sufficient to displace as much of the remaining gold solution as possible, and in some cases a vacuum is used to dry the pulp to about 15 per cent moisture.

After the ore has been leached and thoroughly washed, it is sluiced out of the leaching tanks over some style of fine concentrating plant. At the present time two styles of such plants are in use, one having the Wilfley tables, the other, riffles and blankets. The idea of concentration is to recover the coarse gold which has not had time to be affected by the cyanide, and also any sulphides carrying values.

If a mill be located so it is short of water for sluicing purposes, it becomes impossible to concentrate after leaching, and the general custom is to shovel the waste material from the tanks.

The solutions containing the gold are then allowed to pass through zinc shavings, which are made as needed at the mill from sheet zinc, the gold and silver being precipitated by the zinc.

The "clean-up" of the zinc boxes is very simple, and the zinc slimes which contain the gold and silver are treated, as a rule, at the mill and the bullion shipped direct to the mint.

In most of the cyanide mills of the State a weak solution of cyanide of potassium is used, ranging from two-tenths of 1 per cent to four-tenths of 1 per cent, and a chemical and mechanical loss of cyanide from one to two pounds per ton of ore is made. The loss of zinc varies considerably, and ranges from one-quarter to two-thirds of a pound per ton of ore.

Below is the approximate treatment cost per ton of ore for a fifty-ton plant, running twenty-four hours:

	Per ton.
Labor in crushing department	$0 52
Fuel for dryer and steam purposes	48
Labor in leaching department	22
Chemicals consumed	74
Repairs, including screen wear	10
General wear	07
General expense	08
Insurance and taxes	07
Assay office and chemist	10
Office and management	17
To concentrate after treatment	15
Total	$3 70
If ore needs roasting, add to above	75
If ore is sampled before treatment, add to above	45
Making a total cost of	$3 90

The cost given herein will vary considerably, owing to wages paid and price of fuel, this estimate being based on $3 per day wages and coal at $5 per ton, which is the average cost in the mountains.

All the cyanide plants working on crude ore in Colorado are crushing between twenty and thirty mesh. The time consumed in loading, leaching, washing and discharging a tank containing sixty to seventy tons of pulp varies from four to twenty days; some of the important reasons for such a difference in time being the strength of solution used, value of ore, fineness of the gold to be dissolved, amount of silver and state it is in, condition of pulp, whether of a granular or slimy product.

The concentrates are generally rich enough to treat by smelting. If they are too low grade or too expensive shipping, it is possible in some cases to roast and retreat by cyanide.

The cyanide process is being used in various ways and in connection with other methods of treatment, viz.: Dry roasting and leaching; sampling, dry crushing, roasting, leaching and concentrating; sampling, dry crushing, leaching, only partially concentrating, making a low-grade concentrate, roasting the concentrates, and re-treating by leaching the roasted concentrates; dry crushing coarse, leaching, regrinding, amalgamating and concentrating; wet crushing, amalgamating, cyaniding the tailings and waste; wet crushing, amalgamating, concentrating and treating the concentrate by cyanide.

The cyanide process is used in a number of places to treat old tailing dumps, and has proven a great success. In some sections tailings are treated for $1 per ton, total cost, and in one place as low as 60 cents per ton. The mode of treatment is similar to that used in leaching crude ore, but as a rule some neutralizing agent must be used.

Up to the present time the treatment of slimes or a very slimy ore in large quantities by the present mechanical arrangements now in use has been a commercial failure, nor have we now in actual running shape a mill which has installed a system that can be considered or called a continuous method of agitating and filtering, thereby giving a continuous flow of ore treated, like that coming from a stamp or concentrating mill. Such an experimental plant, located in Denver, is now being thoroughly tested, and if found to be successful will be capable of handling slimes, also be a continuous process, and therefore will become a great addition to the future success of the process.

Chlorination.—The Cripple Creek and Boulder county telluride ores are at present the best in the State for the chlorination process. The largest mills are:

	Tons per day.
The Colorado-Philadelphia Reduction Company, Colorado City	250
The Gillett Reduction Company, Gillett	75
The Kilton Reduction Company, Florence	40
The El Paso Reduction Company, Florence	100
The Delano Reduction Company, Boulder	50

It requires about the same kind of crushing machinery as mentioned for the cyanide dry crushing plant, but, instead of crushing as fine, twelve to twenty mesh is all that is required, and by keeping the crushing coarse the washing of the pulp in the chlorination barrel is more perfect.

Every chlorination plant must roast the ore before treatment, and the same roasters are used as those employed in cyanide mills or smelters, with the same methods of cooling the ore before going to the hoppers over the chlorination barrels. The barrels in use vary in size from the five-ton barrel, which is about 5 feet in diameter and 9 feet long, weighing, complete, about 10 tons, to the ten-ton barrel, 6 feet in diameter and 14 feet long, weighing about eighteen tons. The shell of the barrel is made from heavy steel plate, with cast iron heads, well bolted, all lined with heavy chemical sheet lead. In the barrel is a filter which consists of a sheet of perforated lead, wooden segments and asbestos cloth, all put in to please the man in charge.

The roasted ore is charged into the barrel with water to make it of the proper consistency, and the required amount of chloride of lime and sulphuric acid added. After the barrel is charged it is closed and revolved slowly from three to eight hours, then the solution containing the gold is drawn off through the filter into lead-lined settling tanks. The filtering and washing are assisted by air or water pressure.

Sulphur dioxide and hydrogen sulphide gas are used by some of the mills to precipitate the gold from the solution, and the liquor is passed through a filter press, where the gold slimes are collected, then dried, roasted and finally reduced into almost pure gold by melting with proper fluxes.

The other method used to precipitate the gold from the solution is to pass the liquor through pulverized charcoal, which is finally taken from the precipitating boxes and spread on large roasting pans made of cast iron, and the charcoal burnt off, leaving a gold residue, which is mixed with fluxes, melted and run into bars.

The chlorination mills use the same methods of concentrating the tailings as the cyanide mills.

The chemistry of both processes has been avoided, as this article is intended to touch only the practical and commercial sides of the subject.

The percentage of saving by the cyanide process compares favorably with the saving made by the chlorination, which is 85 and 95 per cent of the assay value, some advantage being in favor of the cyanide process if the ore carries any silver, as the cyanide will recover from 70 to 80 per cent of the silver values, while chlorination saves no appreciable percentage of the silver.

The custom at the present time in the majority of the Colorado cyanide and chlorination mills is to build them of large capacity and to treat custom ore.

The general impression is that the day is not far distant when the question of roasting will be better understood, and the mining public will become better acquainted with the two named processes. Then the mine owner will build a mill of small capacity, adapted to the mine, as is now practiced by the mine owner who builds and owns his own stamp or concentrating mill.

Amalgamation.—A large proportion of the gold ores susceptible to amalgamation, in whole or in part, is reduced by stamps, with centrifugal mills of variable patterns a good second. While no radical changes have occurred, the old custom of feeding the battery by hand is almost wholly replaced. New equipment of crushers, rolls and automatic feeders at the "head" of the mill being quite common, and is now considered an essential part of the modern mill. The stamp battery as a reducing device has stood the test of generations, but its operation is almost as variable as the mills operated.

The old reliable slow-drop Gilpin county mill still holds sway in that region, and the question of utility as compared with the more modern compromise or quick-drop mills still remains unsettled except with the various patrons. What is known at the Gilpin county mill uses a 500-pound stamps, dropping 16 inches, thirty times per minute. The mortar is deep, with high issue, and a large proportion of the gold is amalgamated within the mortar before reaching the plates. Notwithstanding adverse criticism and the charge of doing poor work and little of it, these plants continue business and the operators and patrons express their sympathy for their modern brethren who have followed recent customs. In this particular section there is grave doubt of the quick-drop, coarse-crushing mill making as high a saving as the slow-drop, fire-crushing mills. This can only be stated as a matter of opinion based upon somewhat extended investigation, owing to the fact that the different mills operate upon different ores so that absolute comparison can not be made. A number of stamp mills have been erected during the pass year in various sections of the State and as previously stated differ materially in their method of operation. The tendency is, however, towards heavier stamps, faster drop and depending more upon the outside plates (the inside plates being often omitted) to collect the gold and the appended devices for concentration to recover the remaining values. The weight of stamps vary from 650 to 1100 pounds, the drop from 4 to 12 inches and screens from twenty to sixty mesh. The amalgamation plates are with few exceptions silver plated, but vary in size and pitch to suit the ideas of the operator. An increase in use of plates in "launders" transmitting the ore from the plates to the concentrating tables is worthy of mention. As a rule these plates are placed in the bottom and sides, but occasionally wing plates are set in so that the pulp is partially stopped by each and thrown from one to the other. The recovery upon these

*Condensed from Report of State Bureau of Mines.

secondary plates is variable, the most notable instance being an amount equal to operating expenses of the mill and claimed to have been entirely lost previous to their introduction.

The fact that absolutely free milling ores are very rare in Colorado is becoming more and more appreciated, and more attention is given to the recovery of values after the portion susceptible has been amalgamated, also to the commercial proposition as to whether a higher recovery from fine crushing and small tonnage is preferable to a lower recovery from coarser crushing and increased tonnage. In a number of cases the financial gain has been found favorable to the lower saving and increased tonnage, and values that ought to be recovered are thereby turned into the stream beds, not through ignorance but inability to increase milling capacity and necessity of making money to satisfy the stockholders.

Annual Assessment Work.

On page 545 of this issue is a notice of Judge Hallett, of the U. S. District Court of Denver, Colo., his experience in mining cases, and his action regarding mining experts.

Some time ago a case was before him in Denver, which illustrates another phase of his judicial action, and incidentally is of interest to miners and prospectors everywhere.

The case referred to involved the question of the annual work which the holder of a mining claim must do to prevent the loss of his title. The decision was in favor of the man who held the claim upon which it was said the annual work had not been done. In this instance there was some doubt whether the claimant had done $100 worth of work during the calendar year, and the plaintiff in the action jumped the claim on the theory that sufficient work had not been done. But the court brushed aside his alleged title, together with all consideration of whether the work amounted to $100 or not, by laying stress upon the fact that the locator resumed work upon the claim before the jumper's alleged rights began. The principle of law involved is not new but it is well for miners to bear it in mind. Annual assessment must be done, not to keep alive a title, but to prevent it from lapsing. In this instance it was, in the opinion and judgment of the court, a matter of indifference whether the annual work for the year in question was done or not, the locator having asserted his rights the following year before the other party to the location attempted to re-locate. If no one else asserts a claim to the property, a locator need not do any work at all upon his claim. He may locate it to-day and do none of the annual labor for ten years. Still, if then he should make the requisite $500 worth of improvements he would have a right to a patent, and his title would relate back to the date of his location, notwithstanding in the meantime he had done no work at all. But the prospectors should remember that in all such cases the risk is on them. A claim would be jumpable in the case supposed. It remains alive only because no one interferes with the rights of the locator. In this connection it is important to observe that the law requires $100 worth of work; and not 10 feet, nor 20 feet. In many Colorado districts it is a custom to call 10 feet sufficient compliance with the law concerning annual labor. But the custom of a mining district cannot and does not do away with the federal law. Every Colorado locator who does only 10 feet of work, which is not, as a matter of fact, worth $100, runs the risk of having his claim jumped unless in the following year he resumes labor upon it before any jumper attempts to take possession. Five dollars' worth of work or no work at all may suffice if no one disputes the possession, but $99 worth will not suffice, if before the resumption of labor the following year the claim is jumped.

Production of Asphaltum in '97.

An abstract of the report of E. W. Parker, statistician of the U. S. Geological Survey, on the production of asphaltum in the United States during '97, shows that the aggregate production of asphaltum, bituminous rock, etc., in '97 amounted to 75,945 tons, valued at $664,632. The production of ordinary crude asphaltum in California decreased from 6500 tons in '96 to 5971 tons in '97, but the average price per ton was practically the same in the two years. The production of California, Colorado and Utah in '97 was as follows: California, 68,650 tons; value, $598,502. Colorado and Utah, 3700 tons; value, $47,500. Total, 72,350 tons; value, $646,002.

At the close of the Midwinter Fair in San Francisco four years ago, the big electric searchlight was taken to Mount Lowe, Cal. Among other war preparations, the Government has leased it for use in San Francisco bay, in connection with the fortifications. It is said to be the largest searchlight in the United States, being 10½ feet in diameter, and weighs about 6000 pounds. The mirror used in the projector is 5 feet diameter.

COMPARISON is constantly and cordially invited.

Some Metallurgical Methods.*

G. H. Blakemore, Gen. Mgr. Lake Illawarra Smelting Works, Australia, made some recent extended remarks before the Australasian Scientific Association which illustrate the local point of view regarding furnaces and smelting methods there. He said:

At the British mine a change was made in the design by John Howell, who substituted mild steel jackets for the brick shaft of the furnace of Mr. Schlapp's design. One great trouble in a lead furnace, when smelting sulphide ore with or without zinc, is the manner in which the sulphide causes the formation of crusts or scaffolds in the furnace 12 inches to 18 inches below the level of the top of the ore charges in the furnace. As the lead sulphide reaches the smelting zone of the furnace part of it sublimes and ascends through the loose ore, and deposits again on the cooler walls of the furnace. With a brick furnace the walls of the shaft are never so cool as the water-jacketed shaft, and the sulphide of lead and zinc seems to incorporate itself with the bricks. When this crust grows to such a size as to materially interfere with the working of the furnace it is usual to run the furnace down, stop putting fresh charges into the furnace, and allow the level of the ore and fluxes to sink until it gets considerably below the crust or scaffold. Then the blast is taken off the furnace and the crust is prized off. The disadvantage of the cementation of the crust with the brick walls is then seen. The crust, being all of a dull red heat, one may chip pieces off with laborious effort, but an attempt made to clean the walls to the original form of the furnace shows that the crust has become part of the brick shaft, and the latter gets very much damaged in the operation.

With the water jacket walls the crust is a very different concern. Instead of being a solid, tough and immovable obstruction, there is but one place in it that is hard, naturally the face exposed to the heat of the furnace. Behind this hard face is a mass of loose ore, which falls away as soon as the hard shell on the outside is destroyed. Then, the crust does not form any sooner on the cold water jacket than it does on the brick shaft, because the attrition of the descending ore charge has effect on its peculiar form, and it is much more easily removed from the cold iron face, usually in six hours, leaving the furnace its original size. With the brick shaft this may take twelve to eighteen hours, and when left at that is not anything like clean, through the fact of the crust having filtered into the pores of the brick and made itself a part of the structure as before described. Much has been said against the water jacket shaft on the ground of increased fuel necessary through the amount of caloric carried off by the water, and a nice mathematical calculation is not sufficient to overcome the great advantages which the water jacket shaft has over the brick, and no more fuel used with the water jacket shaft than with the brick shaft furnace.

It is no uncommon thing to see a number of the brick shaft furnaces being burnt out just above the lower jackets. Unskillful work is the natural retort, but with the irregularity in composition of the ore this might naturally be effected. Such a trouble is never experienced with the other style of shaft, and the test of experience has demonstrated there that for good, fast, clean and cheap work the all water-jacketed blast furnace is the better. The top half of this furnace consists of hollow wrought steel jackets, with a 6-inch water space, three jackets being 9 feet 9 inches deep; the fourth, recessed to carry the flue or downcast, is 8 feet deep. The water is fed in at the bottom of each jacket with the view of preventing the deposition of any sediment, and the whole of the jackets are connected, to make sure of an equal water circulation through them all. The jackets are supported by lugs, which are riveted on them, standing on an oblong framework of 8-inch I iron, the corners of which rest on four hollow cast iron columns or pillars, serving also as waste water pipes. The jackets are surrounded with an iron strap, making the whole a stiff and strong job. The structure at this stage, and before the lower jackets are put in place on the brick crucible, presents the appearance of a large rectangular box, with rounded corners, not having any bottom or top, standing on four legs—the columns. The lower half of the furnace consists of twenty cast iron hollow jackets, each 20 inches in width by 57 inches long. There are six jackets on each side, with a circular opening cast in them large enough to allow a water-jacketed tuyere to be entered, and these tuyeres project beyond the jackets into the furnace some 9 inches. Four corner jackets have no tuyere openings, and four end jackets (two each end) have 4-inch openings in them to admit air, but no water-jacketed tuyere.

The water is fed into the top of each of these jackets, and is conducted to the bottom by a passage cast inside the jacket. The escape is from the top, and by having a pipe bent somewhat to the shape of the letter S, the delivery of the water is effected into a launder at a point 9 inches above the highest point of the jacket, doing away with any chance of steam gathering in it. The launder can thus be made a fixture, and does not require to be moved when a jacket has to be taken out of a furnace.

All the water from the top and bottom jackets, tuyeres, breasts, separators, and slag spouts delivers into the launder, which surrounds the furnace, and this in its turn empties the water into the hollow columns which support the top jackets. From these columns pipes underground carry the water to cooling tanks, from which it is pumped back to the supply tank for use again. Each of the lower jackets has three lugs for bolts on each outside perpendicular edge, and, in addition to bolting the whole of them together, a binder of 60-pound steel rails goes around them to stiffen the structure. The crucible on which these jackets stand consists of a large pan made of ½-inch wrought iron plate, in which brick is laid with fire clay to form a basin or well to collect the lead reduced from the ore. The lead is drawn off from this well by a passage in the brickwork, starting at the bottom of the well, and passing up and outwards at an angle. This system is not a syphon, the lead simply rising in the passage and obeying the law of all liquids in finding its level. The Matthewson matte separator is an ingenious arrangement, which takes advantage of the presence of the blast in the farnace to have the slag forced to deliver at a higher level outside the furnace than it lies inside. It is satisfactory only when small quantities of matte are being produced.

The brick shaft furnace requires no description other than that the brick shaft is supported on a heavy cast iron entablature, supported on cast iron columns. The all-water jacketed furnace just described measured 50 inches wide, and 132 inches long at the lower jackets; 34 inches wide between the noses of the tuyeres. It was nearly 17 feet deep from the feed-plate to the bottom of the crucible. Since these furnaces have been built much larger furnaces on the same design have been erected at other works, and have given satisfaction.

(*To be Continued.*)

*Condensed.

THE freedom from competition in gold mining gives an impetus and advantage to this class of industry that is not enjoyed in any other line of business; the product is always marketable. Many capitalists and investors have overlooked mining as a source of wealth and field for investment, because they are unacquainted with mining matters and mining business. In modern mining chances are reduced to the minimum, and do not enter into it in the degree that the newspaper and daily conversation would indicate. Operations in mining can in an anticipated way be placed and the results estimated with some precision. In the past decade great improvements have been made in the methods of mining and treating the ore. A great change has been made by cheap and rapid railway transportation by the reduction of expenditures for labor and supplies and by improved mining and milling. The success of mining primarily rests on the mine itself. If a good property is secured and the management be honest, competent and skillful, success is as likely as in other forms of business.

"A MODERN gunner," says an official in the United States army in a recent article, "must be able, while shells are bursting above his head and his comrades are falling around him, to work out a problen like this: "That ship is three miles off; she is approaching at such and such an angle, her speed is fifteen miles an hour, the forward turret is the place to hit, the wind is strong from 9 o'clock, the temperature is 75 and the barometer is 30.06, I must, therefore, give so many degrees of elevation and allow so many points for windage." Having done this, he must aim his gun with the greatest rapidity and exactness and fire. If he makes a mistake in any of the factors of his equation, or lays the gun so that the variation of the sight is greater than a fiftieth of an inch, his shot is wasted. If he is right in everything, he may disable the ship he fires at, and by so doing save the city he is protecting." A single load for a 13-inch gun costs about $1250.

AT the time of the civil war electricity was little known; conditions then were very different than now: of the effect of war upon the electrical industry there is no precedent. The uncertainty of the past few months has caused a number of contracts to be withheld, but the Government has been a large purchaser. The exports of electrical apparatus during the last fiscal year were $3,054,453; the current year may exceed this, and there seems no reason to believe that war would in any way curtail the expected increase.

THE plans of the Board of Public Works for the improvement of the Sacramento river, Cal., have been approved by the chief engineer and the Secretary of War. The permit was sent from Washington, D. C., on the 19th. This enables the State to carry out its plans for river improvement. They include, among other things, the removal of the Newtown shoals, the building of easements and the construction of wing dams.

THE melting point of commercially pure aluminum —98½ to 99 per cent—is 1160 degrees F., 626 Cen.

Speed Government in Water-Power Plants.*

NUMBER II

MARK A. REPLOGLE.

The second factor to be considered is the water wheel itself. It has a possible range of speed from zero to even faster than the spouting velocity due to the head, and it is unlike a steam engine in many respects. Its periphery must move at a velocity that is a proper ratio to the spouting velocity of the head, in order to gain the highest efficiency of power. The wheel also allows practically the same quantity of water to pass through it at any of its possible speeds. If any difference, it allows more water to pass through it at underspeed than it does at overspeed. So it can be readily seen that an accurate gauging of the water that enters the wheel does not necessarily have anything to do with the speed. The speed of wheel is the result of quantity of water combined with pressure on one hand and load of work on the other. Therefore, any change in one of these three factors causes a change in the speed.

If a wheel at the end of a long closed pipe containing hundreds of tons of water were running at normal speed, carrying a certain load, its speed would remain constant if no changes were made in the conditions. If, however, the gates were slowly opened, its speed would be increased by the greater quantity of water entering it. If, instead of this, a part of the load were dropped off, the speed in like manner would rise. If the gates were slowly closed the speed would soon begin to fall. But if the gates were rapidly closed the momentum of this column would cause a much greater pressure at the wheel gate openings, and for an instant cause practically the same amount of water to enter the wheel at higher velocity. This amount of water having higher velocity will contain more energy or power for the time being, and of couse will impart more to the wheel, increasing its speed slightly for a short time instead of immediately decreasing it, as would seem natural. This tendency for an increase in speed, added to the increase already caused by a part of the load being dropped, will make it necessary for a greater amount of work to be done by a governor than would be proper after the momentum effects in the pipe had subsided. It can also clearly be seen that, if the gates are opened again quickly, the velocity of the water entering the wheel will be decreased until the whole column acquires an increased motion; hence, the power applied will be diminished for a time instead of increased. These momentary and opposite effects make water government a harder problem to solve than the government of steam.

Third, water wheel gates, as compared with steam valves, are heavy and unwieldly. They must also be moved through water, which is much denser than steam, hence cannot be moved with the same facility. They require much more power for their movement. Sometimes the designer of a water power plant does not place importance enough on the government of the wheels to make substantial gate rigging. The gate shafts may be too light, showing torsion when operating, or there may be a train of cog gears that allows much lost motion. The gates may be so designed that the water pressure gives them an unbalanced condition, requiring much pressure to be neutralized before it is possible to move them in a reliable manner. Turbine wheel gates built in this country often weigh several thousand pounds each, and sometimes must be moved several feet through water in being opened. Often it is necessary to add weight equal to their own weight as a counterbalance. The power required to overcome the inertia of and move this great mass often reaches many thousands of foot pounds. It can readily be seen that to govern such gates with precision and accuracy requires a combination of both delicate and powerful machinery. Also, when it is considered that it is possible to make the full change of an electric load in the fraction of a second and impossible for gravity to meet the power demands short of a number of seconds, it is plain that to govern a water power plant successfully is a matter of more moment than would seem at long range. It must also be borne in mind that the change of load must occur, and the speed must be impaired before it is possible for a governor to operate at all.

The fourth element to be considered is gravity, the source of all energy or power that can be had from water. Its effect can be considered as a constant in reasoning about power getting. Of course, it is variable within certain limits. A square inch of opening at the bottom of a vertical column of water will allow gravity in a given time to generate a number of foot pounds of power, and in direct ratio to its height. This power is absorbed in giving velocity to a steam of water an inch square and spouting a number of feet per second. Gravity has established an epuilibrium in giving this velocity to the water. If the opening were increased the power generated would increase in like ratio. It is the duty of the turbine wheel to reduce the velocity of this water as nearly as possible to zero without changing its own speed. In so doing the power is transferred to the wheel shaft, where it can be carried to other points. With exception of the small amount of power that is required to give a slow, downward movement to this vertical column of water, it can be said that the full effect of gravity is represented at the gate opening. Also as soon as the opening is increased or diminished, there is practically the same increase or diminution in the amount of power represented by the volume and velocity of the water.

Again, if this column of water extended in a horizontal direction from the top of the vertical column and the whole encased in a closed pipe or trunk, it can readily be seen that, when gravity operates on one square inch at the foot of the vertical column, it must put in motion the horizontal mass of water at the same time that it does the vertical mass. It is plain then that, while gravity has begun active operation as soon as the opening is made, its full effects will not be represented at the opening or wheel until the whole mass has been supplied with enough kinetic energy to give the necessary motion for the full spouting velocity at the gate opening. It is apparent that, while gravity is limited in the amount of power it can supply in a given time, it can be, and often is, further limited in its time of supplying power for governing purposes by the use fo long pipes.

Considering the facts, that a change of load must be made before a governor can begin operating, that it requires time for a governor to perform its operation, that torsional and lost-motion effects are found in all gate riggings, that gravity must have time to do its work and may further be obstructed by injudicious flume construction, and that the wheel is limited to a certain opening and need not necessarily run in the ratio of the amount of water passing through it, it follows that absolute speed cannot be obtained in water powers under heavy changes in load, as a change in load must necessarily change the speed before it is possible for gravity to furnish an increase in the supply of power. If there were no other factors government would be an impossibility, as a change of 50 per cent in load would instantly cause a change of 50 per cent in speed. But there are other factors, and, be it said to the credit of the great engineers who designed America's greatest water power plant, these other factors were clearly understood, intelligently calculated and incorporated into its construction. They are visibly stamped in every part of its make-up. (Plate II.)

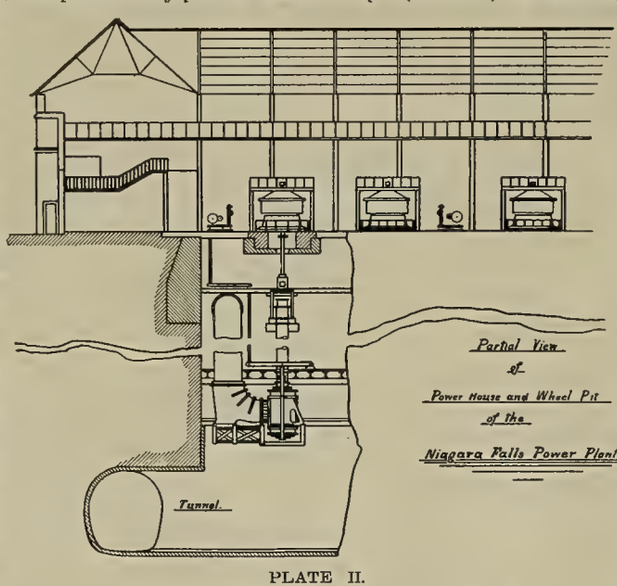

PLATE II.

The first notable element is the size of the power units, 5,000-horse power each. The second is the capacity of each unit for a storage of kinetic energy. It is absolutely necessary to have an accumulation of energy in reserve to tide over sudden fluctuations in load until gravity can make proper compensation. The designers of the great Niagara plant first determined the degree of government necessary or desirable, and from this as a basis the plant was constructed. The results show that the speed government is well within the limits for which the units of power were designed. It is evident that there is a great accumulation of energy in reserve when an instantaneous change in load of 1000-horse power causes only 2 per cent variation in speed, especially when the conditions are such that it requires about three seconds of time for gravity to increase the power supply to this amount.

There are several methods by which a reserve storage capacity can be maintained, but the one used at Niagara seems to be the simplest and most reliable. It certainly is the cheapest, being also purely mechanical. Reference is now being made to the balance-wheel or momentum effects of the revolving parts. It will be remembered that the armature, which is usually the lightest portion of a dynamo, is stationary in the Niagara Falls plant, while the field magnets, supported by an immense steel band, are the moving parts. It is also noticeable that the great shafts reaching downward to the turbines are of large diameter, being great tubes. This is for the purpose of giving high velocity to as much of the material as possible. A certain capacity for stored energy was necessary for good government, and it is safe to say that if this could not have been reached with the present weights and velocities of parts, more would have been added in the form of actual balance wheels.

(To be Continued.)

*Journal of the Franklin Institute.

Cyaniding and Chlorination.

Which of the processes is the cheaper—cyaniding or chlorination? asks the Nelson, B. C., *Miner*, and says:

An attempt will be made to furnish an answer without entering too much into technical details. The drift of recent experience in this direction has been to show that cyaniding is liable to be cheaper than chlorination:

1. If the ore does not require roasting.
2. If the gold is not too intimately combined with pyrites.
3. If the character of the auriferous ore is of a more basic than acid nature.
4. If the chemical supervision of the process is above all criticism.

In the few rare instances, when the majority of these conditions is fulfilled, the cyanide process can be considered a success. Thus on the Rand the treatment of tailings has yielded good results. It appears that in this case the gold is not intimately associated with the pyritic portion of the tailings; neither is roasting required, owing to the absence of tellurides. In this country the Mercur mine, Utah, has applied the cyanide process with marked success. In this case the ore is a silicious limestone, and the gold occurs as a fine coating on particles of magnetic iron ore.

On the other hand, chlorination is applicable under all conditions, excepting the rare cases when the gold-bearing rock contains a notable quantity of lead minerals or carbonates, which are decomposed by acids.

An objection, which is frequently made in discussing the chlorination process, is the costliness of the plant on account of the necessity of roasting. But is the sweeping statement of the partisans of cyaniding, that roasting is not necessary for their process, really well grounded?

Recent experiences point in another direction. It appears that in most cases the extraction of auriferous pyrites by cyanide solution is promoted by light roasting. In the case when gold occurs combined with tellurium as telluride, roasting becomes absolutely necessary. Some of the cyaniding plants which have been recently put up in the Cripple Creek district have made provision for the erection of roasting furnaces.

As an important argument in favor of chlorination, the fact should be mentioned that the chemistry of this process is less complicated than that of cyaniding. The difficulties of cyaniding, as they present themselves, particularly in Colorado, have been vastly underrated, owing to the comparatively good results on the Rand. The fact that cyaniding is a chemical process has been almost entirely lost sight of in the western States. The managers of the existing works are, without a single exception, mining engineers, but not chemists, while to overcome the difficulties which characterize the cyanide process, chemists are needed who are able to solve independently new problems and not merely to make tests and assays. At present it is impossible to secure such competent men at the low rate of wages usually paid to chemists in the western States.

As far as the cost of plant is concerned, the expenditure for erection of a chlorination works is at present somewhat higher than for a cyaniding plant, as the latter does not include lead-lined vessels; on the other hand, it is reasonable to expect that the cost of chlorine will soon become very low, owing to the recent improvements in the electrolytic production of this chemical from brine, while the price of potassium cyanide has probably reached its lowest level.

Briefly summarized, the conclusions which have been arrived at are: Under exceptionally favorable conditions cyaniding is cheaper than chlorination, but under all circumstances it is safer to operate chlorination works. Chlorination can be successfully applied to almost any ore, while cyaniding gives satisfactory results only with a certain class of ores. Cyaniding plants located in such localities as Cripple Creek run certain risks, as the character of the ores from this region is liable to change from day to day. Apart from that the cyanide process labors under the disadvantage of requiring, in most instances, an extremely skilled chemical supervision. The chemical part of the chlorination process is, on the other hand, very simple. Lastly, the recent developments

in the electrolytic preparation of chlorine open up the prospect of a great reduction in the price of this chemical. Some of the gold-producing western States abound in coal, salt and water power, which are the essential conditions of the cheap preparation of chlorine.

Mining Summary.

CALIFORNIA.

Amador.

Sinking is going along at the Anita mine and will continue until a depth of 1000 feet is reached.——No work is being done at the Alma, but it is locally said the company will try it again in a few months.— The shaft in the tunnel at the Amador Queen No. 2 is down 125 feet, and sinking will be continued until 1000 feet is reached.——At the Argonaut there are about 100 tons of sulphurets on hand. Several dividends of 10 cents a share have been paid and about $100,000 in the treasury. The few months' run is highly satisfactory to all concerned.——The Amelia mine has reached a depth of 600 feet and sinking continues. Water has interfered with the work somewhat and a pump will be put in. ——Pratt & Hardy located a claim in Amador creek and will work the tailings from the mills which have dumped into it for forty years.—— B. Levaggi, assignee, has commenced an attachment suit against the Columbia G. M. Co. at Plymouth for $2357.18.

The Blue Lakes Water Co. is extending its electric line from the South Eureka mine to the Sutter Creek power plant, and, when completed, the Amador Electric Railway & Light Co. will use energy direct from the Blue Lakes Water Co.——The Amador *Republican* says it is reliably informed that the capital necessary to carry out the Blue Lakes Water Co.'s scheme of transmitting electric energy from their plant on the Mokelumne river to San Francisco is ready to be invested. The capitalists are waiting for the report of the expert who has been investigating the proposition. If his report is favorable, work will begin at an early date. It is expected that by June 1st the matter will be definitely decided.

Butte.

The Silva Co. at Cherokee are said to have realized $10,000 from their recent clean-up.

Calaveras.

Work is progressing with satisfactory results at the Thorn mine near Angels Camp. W. Garrard is Supt.——The McNear mill started on quartz from the Red Gold mine. Work in the levels is suspended until the completion of the hoist and the placing of machinery for thorough work.——Work has been commenced on the Schaeffle gravel mine, near Murphys.——The Woodside M. Co., near Angels, are preparing to build a 40-stamp mill and electric motor.——Everything is running in good order at the Smadeke mine at Smiths Flat. Sinking goes on.

The 8-stamp mill on the Moser gravel mine at Mokelumne Hill is nearing completion and will soon be ready to drop stamps, provided water can be had.——At Robinson's Ferry W. C. Ralston has thirty men at work in the Melones tunnel, the object being to get under the highest point on Carson hill. The tunnel at present is in 2100 feet.——The Stockton *Mail* has been informed that the Thorpe mine, at Fourth Crossing, was sold or bonded to the Princess Co., in which Prince Poniatowsky is interested, for the sum of $250,000.

El Dorado.

(Special Correspondence.)—The Gentle Annie mine is building a cyanide leaching plant to work their sulphurets. The ore of this property carries a fair percentage of sulphurets of very good value.

The Vandalia mine, located thirteen miles west of Placerville, which has been abandoned a number of years, has resumed work under a new ownership and is meeting with good success. They have a large ledge, much of which is good grade and all of it easily worked.

J. Melton has run a tunnel on the vein in the old White property, and is taking out good ore. He has a depth of 600 feet in the present tunnel, but is beginning another considerably lower. He contemplates building a 15-stamp mill for which he will be ready very soon.

At the Ohio mine near Greenwood, a good vein has been found below the 300 level.

In the Gold Note and Philadelphia properties near Omo, which Senator Chapman recently purchased, thirty men have been put to work. An entirely new plant, including stamp and saw mills, will be installed.

The Taylor mine shut down last Saturday night; the cause is not known here. It is current rumor that the property is changing hands.

The Crown Point properties south of Placerville, were sold last week by, Thomas Clark to a Scotch company and work will begin on them without delay.

Placerville, May 16th, '98.

Fisher & Luce are developing a quartz property near Middletown. —— Hancock & Marquardt are washing 3000 carloads of gravel on their property near Granite Hill.

Nugget: At the old White mine J. Melton has cut through 25 feet of pay ore.——At the Gentle Annie sinking continues. Ore is being milled from the 500 level.——The business troubles of the Pocahontas have been adjusted and work will be resumed.

Democrat: The Union mine, from a seven days' run, cleaned up seventy pounds of amalgam.——Work continues with success at the Sunrise mine, near Kelsey.

Inyo.

F. Meysan, near Lone Pine, is developing a group of claims on which he is said to have a 40-foot ledge nearly the length of three claims. Assays show an average value of $5 per ton.

The Inyo M. Co. near Darwin made a strike on the 700-foot level of a body of copper ore, large in extent, which will make four different ores now being taken from this mine—gold, silver, lead and copper. A smelter is being put in which will add materially to the output, as heretofore all the ore was shipped. Owing to the recent copper strike, additional mechanism for smelting that ore will be put in, and within three weeks the smelter will be in operation. The payroll of this concern is now about $2000 a month. The mine has been a heavy ore shipper for a year.

Kern.

The Hard Cash M. Co. at Randsburg shipped twenty tons of ore to be treated with a dry concentrator. The ore averaged $16.50 per ton. The experiment proved satisfactory to both the owners of the mine and the concentrator.

Madera.

(Special Correspondence). — The Standard mine, heretofore operated by W. J. Henderson under a bond, has been sold to a New York company, which proposes to overcome the scarcity of water difficulty under which the mill on the property has labored for some months past, by a pipe line from Fine Gold creek. All the ore in sight is of good grade and the vein is 2 feet in width.

At the Starbuck mine a drift has been run from the bottom of the incline southerly and a vein 18 inches wide of $80 ore opened up. The ore from this mine will continue to be shipped to the Selby works for treatment, as much of the value is in sulphurets.

At the Safe Deposit location on the Magnet lode a chimney of ore 3 feet in width and averaging $8 per ton in free gold is being opened up near the surface to determine its extent. The walls of the lode are here 18 feet apart and perfectly defined. This ore body has now been uncovered for a distance of 60 feet and still continues southerly, the ore increasing in value in that direction, and the chimney apparently widening in its course downward.

The Mud Springs mine continues to furnish good ore at the 400-foot level and the mill is run about half of the time, there not being water sufficient to run continuously.

O'Neals, May 15th, '98.

Nevada.

Work on the Mineral Hill mine, near Graniteville, has been resumed and a 5-stamp mill is to be built for prospecting purposes. The ledge is large; in some places it is 40 feet wide. The property is near the Spanish, and is said to be of a similar formation. The mine is bonded to E. J. Hegarty of San Francisco.

Sinking the shaft at the Bellfontaine mine, near Nevada City, has been resumed.——G. Fellows of Santa Rosa is developing a property near Moore's Flat.

Placer.

A test run of ore at the Last Chance mine, near Emigrant Gap, gave satisfactory results. The 10-stamp mill will be in operation soon. The property is equipped with steam and water power. Twenty-five men are employed. C. W. Porterfield is Supt.

Sentinel: The Prairie Flower quartz mine, near Canada Hill, comprises three full claims. Average width of ledge, 2 feet; ore free milling, paying about $10 per ton. The ground is opened up for about 300 feet. A new tunnel is started which will tap the ledge at 400 feet. Ore can be mined at a cost not exceeding $2.50 per ton. Daily capacity of the stamp mill is fifteen tons; mill run by steam. The company proposes to put in a pipe line this summer. G. W. Payne is owner and Supt. ——C. C. Handy has ten men at work on the Boulder. He is drifting and stoping on the 250-foot level.——C. A. Reed is stoping at his St. Lawrence mine. A run of eighty tons of rock paid well. A shipment of selected ore netted $200 per ton.

The Pioneer directors have under consideration the question of doubling the number of stamps to forty. The company is reported to have ore reserves and sufficient ore in sight to keep forty stamps running full time. The flume to be constructed from the new reservoir will be 6 feet square. The April statement of the Pioneer Co. shows 960 tons crushed; value, $13,102; expenses, $6,422; income, $6,680; per ton, $13.64. The statement for the eleven months ended April 30 shows gross income of $134,320, and net earnings of $68,860. The average value of the rock crushed for the eleven months was $15.95.

Plumas.

The *Bulletin* hears that work in the Green Mountain mine near Crescent is discontinued. —— Mrs. McClure of San Francisco has purchased an interest in the Klondike mine near Quincy and begun prospect work. E. A. Hallstead is Supt.——The Golden A. C. M. Co. resumed work on their property at Bear Creek. They employ twelve men.——The tributers on the Plumas-Eureka have discontinued work.——W. Passeta has five men near Johnsville on the tailings of the Jamison mine.

Riverside.

Considerable work has been done on the Alice mine, near Perris, during the last few years. A short time ago a mill was erected, but after it was put up it was fonnd that the ore could not be worked by the mill process. It is stated that the owners of the mine, L. M. and H. D. Wilson, have associated with them several Los Angeles men of capital, and active work at the mine may begin before long.

San Diego.

Union: The fourth report of Receiver Pauly of the Golden Cross mines has been filed. There was on hand at the time of the last report $55,267.69, and the clean-up on March 1 netted $38,704.84. There was received from other sources $1332.81. The receiver says that he continues to make a profit out of the property and believes he will be able to continue the payments provided for in the stipulation recently made.

The receipts of gold bullion from Lower California this month are in excess of last month's receipts. Gold to the value of $1000 was received from Alamo, and the steamer Pacheco brought up forty small lots of gold aggregating $1200.——New placer ground has been discovered between San Diego and Campo.

Shasta.

J. McGowan has suspended work on the Delta mine, near Delta, on which he holds a bond, on account of scarcity of water for power purposes. He contemplates laying 300 feet of pipe. The ledge in this property averages 3 feet in width. The tunnel is in 350 feet and 60 feet on the ledge. Thirty-two tons of ore, milled as a test, yielded a good profit.

The Three Sisters mine, near French Gulch, which was bonded by J. V. Motherwell and M. D. Howell, is now under six months' lease to J. V. Motherwell and some Deadwood parties. Water is the great obstacle to contend with, but this season will prove particularly advantageous owing to the lack of rain. Work will be prosecuted without delay.——W. T. Cook of Napa purchased the White Cloud and Black Diamond mines, near Muletown, and is pushing development of the property.

Sierra.

Work has been resumed at the Mountain mine, near Sierra City.

Siskiyou.

News: Jones & Daniels have started their mill in Quartz valley.——Mr. Hobart is piping at his Quartz valley hydraulic mine.—— McCall Bros. will put up a small mill on Patterson creek. They have considerable ore on the dump.——The mining activity at present is along the Klamath river, where river claims are having a good season.——On the north fork of Humbug the Shurtleffs have been running their 2-stamp mill with good results. About ten men are working in the mine. Their ledge is from 2 to 4 feet wide. The mill crushes seven tons every twenty-four hours. It is the intention to add two more stamps.——Good quartz has been found at Patterson creek, in Scott valley, by the McCall Bros., who contemplate putting up a small mill.——Marye & Tuttle have discovered a quartz ledge near Cottage Grove which prospects well.

Journal: J. Ironsides discovered good quartz on Cherry Creek.——The Greenhorn Blue Gravel Co. continue to find good pay gravel. The new shaft furnishes a good supply of water, which after being used once is pumped back into a reservoir. By this means a good supply of water is maintained during the last part of summer, when underground springs commence failing.——B. Reed is running his quartz mill steadily, which pays well, he has an abundance of quartz of good quality. ——The Klondike Co., running a tunnel through the Humbug range near town, have reached hard base rock again to render progress slow, but find more quartz seams with considerable sulphurets, also iron and galena. The tunnel has been extended nearly 400 feet, the last 9 feet being in blue rock formation hard to drill, sulphurets and gold being found in the base rock as well as the quartz seams.

Trinity.

T. & B. Hart, after five months' work on their gravel mine near Douglas City, cleaned up $1200.——Bryan & Loftus have let a contract for a 150-foot tunnel on their property near Carrville.——A shipment of ore from the Lappen mine near Deadwood yielded over $200 per ton.——Work is progressing on the Tourtelotte mines near Minerville.

The Bloss & McClary mine at Trinity Center will close down in about a month—much earlier than ordinary seasons. A highly profitable run will have been made this year.—— At the Johnson & MacLeod mine a small mill is employed to handle the talcose surface dirt. ——The Bonanza King mine is now owned by Vollmers, Ellery and Tillman, who purchased the one-fourth interest held by G. R. Doty. ——H. Z. Osborne & Co. of Los Angeles are opening a property near Trinity Center. A tunnel is being run to cut the ledge at 300 feet depth.

Tulare.

Five tons of rock from the Woody mine near White river cleaned up $43 to the ton.

Tuolumne.

The Santa Ysabel G. M. Co., in common with many other California mines, is having trouble with its present water supply. Twenty stamps were operated in April. The ore ranges from $9 to $14 a ton and the company has been for some months earning more than expenses. The management expects soon to cut into the Nyman ore body on the 200-foot level.——The North Star, on Tuolumne river, is being developed by J. Joseph. ——At the Black Oak mine Demarest & Fullen are putting in two 10-inch plunger pumps. This mine employs forty-five men.——At the Omega drift mine, near Montezuma, a new development, good gravel is found and work will continue all summer.——In the Agnes mine a 14-inch vein of good ore was discovered at 60 feet depth.

The Rawhide mine is employing about 100 men. Stoping is in progress between the 1200 and 1100-foot levels.——The Arbona mill at Tuttletown is running day and night.—— The Bown mine is said to be showing good results.——The Bell mine is sinking on a rich pay streak. Twenty-six men are employed. ——The Golden Star mine has closed down, as the operators, is is said, could not get an extension of the bond.——The Good Hope mine on Jackass hill is in operation.——The Marryatt is working night and day. This property will be kept running all summer if water can be procured.——The Norwegian mill has been running but three days in the week on account of scarcity of water. It is expected the mill will be closed in two or three weeks for the season.

Democrat: In the Jumper mine the main shaft has reached 675 feet. At 700 the vein will be crosscut and drifted on north and south. On the 400, 500 and 600 levels the drifts both ways on the ledge are being extended, showing large bodies of high-grade. The twenty stamps of the mill are dropping day and night; twenty more will soon be added. These would be put in position at once were it not for the shortness of the water supply. The Jumper Co. purchased two tracts of land. On one of these, which parallels the Jumper and New Era mines on the east, a three-compartment shaft will be started at once.——At the Black Oak it is believed a contact has been made on the eighth level 500 feet north of the main shaft. The owners are putting in two 10-inch plunger pumps with a capacity to handle 21 inches of water. An auxiliary 250 H. P. steam plant is also being put in, which will insure continuous operation, regardless of dry seasons. Since the new chute was tapped little work has been done, and its real value has not been determined. The last work done at the 1000 level uncovered a body of ore of high-grade. Average samples assayed $103 per ton.——In the Dutch mine the main shaft is down 725 feet. The ore is reported good, and enough is being extracted to keep the twenty stamps dropping steadily. The principal work is on the 600 level, where the big vein is being drifted on. Supt. Trittenbach has sixty-five men on the payroll. The foundation for a new air compressor, to run ten drills, is being put in. The Dutch is equipped with steam in every department. The Gates canvas plant is being enlarged.——Work at the Hope has been stopped a few days for general repairs.—— The Noonday quartz mine, near the South Fork of the Stanislaus river, has been bonded to E. A. Davison for $20,000.——The Doyle property on Horseshoe Bend, comprising 160 acres, containing two veins of quartz, is being worked by Stover & Shorey, who have been opening up the property for eighteen months. What is known as vein No. 1 has been stripped for 900 feet and prospects well. A 6x8 shaft is being sunk, and crosscutting shows 25 feet of quartz that assays from $2 to $7.50 per ton. This shaft has been driven 90 feet, and at 100 feet the ledge will be crosscut. The rock is heavily sulphureted. When the contemplated development work has been done a mill will be erected. It is estimated the ore can be milled for $1.50 per ton.

Independent: At the App mine the 20-stamp mill is in steady operation.——At the Santa Ysabel group everything is in operation; the various shafts and drifts are being worked with vigor.——The Golden Rule is being developed from the 600-foot shaft by drifts north and south.——The 10-stamp mill on the Longfellow mine commenced running last week. ——At the Agnes mine drifting is being done east and west from the shaft.——The Lost Fox mine has been started under P. G. Carrigon, Supt. Grapevine M. Co. A force has been set to work sinking shaft and drifting. The ledge is 8 feet wide, carrying free gold and sulphurets, assaying from $10 to $80 to the ton.——The Harriman shaft is 200 feet; new drifts will be opened north and south. Good prospects were met in sinking.——The Bonanza is unwatered to a depth on the incline of 1700 feet.——The Rappahannock is nearing the 1000-foot mark; when reached, crosscutting will be commenced.——The Rawhide is now the deepest mine on the lode.——The Trio continues sinking the north and south shafts. Good rock is found in both.——The McCann is a small mine, 400 feet long, but has a rich ore chute.——The cost of development, before any returns were received, of the Eagle-Shawmut, is said to have been over $100,000. The monthly profits now, however, are quite satisfactory.

NEVADA.

(Special Correspondence).—The sulphur deposit in this county is thirty-five miles northwest of Humboldt station, S. P. R. R., and consists of 480 acres, nearly all of which contains sulphur of high grade and fine quality. The property has been worked in the past in a slipshod manner, the local market consisting of 200 to 300 tons being supplied. Recently the property has passed into other hands and is to-day being worked on proper lines and large quantities produced. The crude runs from 80% to 95%, and when refined by the process now in operation at the mine a product is produced 99% fine and of a rich color. It is impossible to estimate with any degree of certainty the amount in tons of the deposit, but the present owners feel confident that they can extract within the next five years not less than 50,000 tons and then have plenty left in the mine.

Winnemucca, May 13th, '98.

The Wadsworth *Dispatch* says the weekly output of gold from Olinghouse Canyon is $500. A 7-foot vein of ore is said to have been developed in the Slip and another for 3 feet in the Hutchinson, the latter showing $60 in gold per ton.

The Summit mill at Pioche continues doing good work, but bad air in the mine limits the output of ore. An air shaft is being put down but a month will elapse before the tunnel can be reached.——The Elko *Press* reports the finding of high grade ore in the Gold Bug mine in Elko county.——Developments in the Star mine at Cherry creek are showing good bodies of ore. A mill with 150 tons a day capacity is to be erected on this property.——The Chainman Co., at Ely, made a shipment of gold cyanides last week.——The owners of the Jupiter mine from a test run made on 100 tons of ore, received an average of $11 a ton on the plates. The work of prospecting the ledge continues and there is a 3-foot face of ore in the drift.——The Delamar Lode says that shipments of high grade ore from the Magnolia mine in that district will be resumed at once. There is a large body of ore blocked out which averages $30 a ton, for the treatment of which a mill will be erected at a later day.——The Gold Crown mine near Aurum is providing some high grade ore.

Among the sales on the New York Mining Exchange last week, says the Salt Lake *Tri-*

bune, were 12,500 shares of Gold Creek of Nevada at 4 cents. This is the proposition that was swung by H. J. Mayham, assisted by Eastern promoters two years ago.

The Pioche *Record* notes a letter from J. E. Peck, Chicago, that he has come out winner in the litigation there, has disposed of a State right for the use of his concentrating plant, and will shortly return to Bullionville and complete his plant. He proposes to considerably enlarge the mill as at present laid out, since he is now able to do it, and to rush the work of concentrating the tailings, and thus make up for lost time in the past.

A sale of the Curieux group of mines at Mountain City will be made, it is locally reported, to C. D. Lane. The price agreed upon is $150,000. More than that amount of ore is said to be uncovered.——Increased activity is reported from many of the old camps; recent disclosures on the Penrod properties, near Elko, have created interest in the locality. The discovery consists of a streak of gold ore that looks as if the owner had a fair prospect. He has been working a small mill on fair ores for some time, and it is the intention now to increase its capacity.——At Ely energetic work is conducted by C. D. Lane, who is making a success of the Chainman, and who is tying up a number of properties in that camp. ——At Cherry Creek the Glasgow & Western E. Co. is operating with success. The same is the case in a number of other plants that have in late years been neglected.

OREGON.

A. A. Davis, near Jacksonville, has a promising ledge, and has sixty tons of ore on the dump ——E. Pierce has sold his interest in the Hamburg quartz ledge to Scott, Merrill & Co. The new proprietors expect to put up a mill soon.——The Barron & Shepherd, near Ashland, is hauling fifty tons of ore to the Ashland mill.——The Ashland-Mattern mine is running a full force and keeps its 10-stamp mill busy. —— The American Bar claim is yielding good returns, and work is prosecuted day and night with a force of thirty-eight men.——A ledge of copper ore has been discovered near Ashland.——La Bellevue mine, near Granite, started its fifty-ton concentrating plant last week.——The Union-Companion mine at Cornucopia is shipping four carloads a month of slimes and concentrates.

The Shasta *Courier* says the existence of an immense mineral lode, at a point on the Oregon side of the California and Oregon boundary line, near the summit of the Siskiyou mountain, has been known to Murray Bros. of Shasta, who also knew that the formation resembled, as far as investigated, the Iron Mountain mine. Recently the Murray Bros. located twelve claims on the Siskiyou mountain mineral outcrop. Associated with them are Sheriff Houston, Tillotson, Pryor and others. Assays of the ore taken from different locations show well in gold and copper.

In Elk creek the Pearl Mining Co. is increasing its force and will do considerable development work this summer. Daley & Potter are working their ledge, with fair prospects.——J. T. Cook of Missouri Flat, while removing some earth near his residence a short since, struck a ledge from which as high as $2.60 was obtained from a pan of dirt.——The Sterling Mining Co. is running its mill and a good-sized force day and night. As a comparatively small quantity of snow fell in the mountains last winter, the run will not be as long as usual.

WASHINGTON.

The San Poil, near Republic, is in ore averaging $60 per ton in gold in the 125-foot level. ——Good progress is made in the Admiral tunnel, and the indications are encouraging.—— Development work in the Butte and Boston is satisfactory.——Satisfactory progress is made in the North Star, Pittsburg, Jim Blaine and Republic No. 2.——Work on the Lost Lode has been resumed.——The Copper Butte Co. is running a tunnel on the Headlight, and the Cantonwine is sinking.——J. Cody has taken a bond on the Independent mine for $40,000, and is pushing development work.——Shinn & Hammond have found a ledge 14 feet wide, which they are developing. They have seven claims in the group.

At Republic the Golden Harvest group, comprising eight claims, was purchased by Spokane and Republic men. A large vein has been found on the property which gives general assay values of $18 in gold per ton.——At Colville the county assessor has assessed the Republic mine at $300,000. The Republic Co. asked that the property be listed at $250,000, while the county assessor insisted on a valuation of twice that amount. It was finally adreed that $300,000 would be a fair valuation, and these figures will stand for two years.

The sale of the Lost Lode mine at Eureka was made to Oliver and Schuster of Spokane, for $12,500. At Myers Falls, in the Black Jack claim, a ledge was discovered that assays $89 per ton.——E. S. Graham is pushing work on his claim with success.——W. K. White, owner of the Earthquake claim near Grand Forks, struck 3 feet of high grade ore. Samples show native copper.

The Senate bill to establish an assay office at Seattle was called up last Monday, the purpose of the bill was to afford a convenient office for the Klondike gold-producers, who will mine this year, it was estimated, from $12,000,000 to $20,000,000. The bill carries an appropriation of $20,000 for expenses of the office. It was passed.

BRITISH COLUMBIA.

It is locally stated that a Tacoma man will build two elevator dredgers at Quesnelle, Cariboo, as river dredging for gold on the Fraser seems at last to be making some success. The people of Cariboo believe that dredging their rich streams for gold should, if intelligently prosecuted, yield excellent returns. Acting on this belief Dr. Craighead is about to operate a dredger on Cottonwood creek.——The managing director at Golden River, Quesnelle, has been visiting the property, and in the course of his report he says: "Gold everywhere; success is now assured." The manager estimates a profit of $2325 a day by employing 300 men, and expects to do better later on.

The War Eagle at Rossland shipped 780 tons last week. Work is continued timbering the new shaft of the mine. The crosscut from the 625-foot level to the ledge continues.——Retimbering the 350-foot level in the vicinity of the recent cave-in continues successfully.—— At the Evening Star the ledge which was lost has been recovered.——In the Victory-Triumph a strike has been made of an ore body about 4 feet wide. Assays go from $18 to $32. —— The Rossland *Miner* says that thirty-two men at the Le Roi quit work because of an order calling for ten hours work in the shaft, instead of eight, as heretofore, without increase in the pay. The men had been getting $3.50 per day of eight hours and had been furnished with rubber coats and boots. The shaft is down 750 feet, and they were obliged to climb that distance twice daily, which also was a factor in their dissatisfaction.——The Slocan Star concentrator resumed operations for the season. The Star is employing a large force.——Fifteen hundred and fifty tons of ore went out of the Slocan last month.

The Lily May Co. at Rossland, at the meeting of its stockholders, ratified the sale of the property to the English company formed in London by H. White to operate a number of Rossland properties. The deal includes a cash payment of $50,000 and 10 per cent in the stock of the new company, which will be capitalized at £50,000. A part of the cash payment has already been made, and the balance is to be paid June 15th.——Work has begun on the Blackcock mine, near Ymir, with a force of twenty-five men.

R. H. Campbell hopes shortly to turn water on at the hydraulic elevator at the gold gravel mine at Harper's Camp, Cariboo. The Miocene shaft has reached 275 feet of depth without touching bedrock. Bedrock is, he believes, however, near at hand, and the shaft is now sunk in a promising body of gravel.

Rossland ore shipments last week were 2262 tons; for the same week last year 1240 tons; shipments since January 1, 1897, 100,203 tons. ——D. Goldberg sold to an Eastern company four properties near Trail for $15,000. Surface assays gave $150 in silver, $3.50 gold and 20 per cent lead.

ALASKA.

Several passengers returning from Copper river came to the conclusion that a glacier was no place for a white man to camp on. These men report from 5000 to 6000 people spread out from the beach to a few miles back. Several small discoveries of gold have been made, but nothing of any great importance.

Circle City, which was deserted during the Klondike rush, will come to the front again this year, says the Alaska *Miner*. Some remarkably good mines have been discovered on ground tributary to it, and for several years past a large amount of gold has been brought out of the country. The mouth of Birch creek is many miles from Circle City, but an easy portage of about fifteen miles brings one to the creek, which runs almost parallel to the Yukon river. There are a number of men who make a business of taking supplies across this portage, and during the winter months the trail is constantly occupied by men who take advantage of the snow to transport a large amount of supplies to satisfy the requirements of the miners at Birch creek. Mastodon and Deadwood creek diggings.

THE KLONDIKE.

As an outcome of permission given three weeks ago by the Gold Commissioner to prospect the present townsite of Dawson, gold has been found beneath the streets of Dawson running from good colors to 35 cents a pan. The formation exposed in a shaft sunk at Dawson shows that the present townsite was once a bar in the Yukon river.

Mail for all points on the Yukon river will be sent on June 10th and 25th by the carriers of P. C. Richardson of Seattle to whom the contract for this route was recently awarded, and also on those dates in July and August. Mail will be sent from San Francisco to Seattle, thence to St. Michael, and from there as far as Dawson, deliveries and collections being made at Circle City and other points on the way. Mail from Dyea, Skaguay and Juneau is sent every five days by way of Seattle.

IDAHO.

Secretary of the Interior Bliss has reversed the land office decision in the case of the Emma lode mining claim, covering lands in the Cœur d'Alene district. The lode claimants will not be obliged to make republication, but patent will issue to them upon presentation of the proper certificate of expenditure of the $500 required by law.

It is reported from Murray that the output of placer gold from the north end of the county will be larger this year than for several years and, with the development work of this year to guide them, the dredging company will still further increase it next year.——The Vestal Con. P. M. Co. is working as fast as water will allow. Their ground, judging from a recent partial cleanup, is the best they have worked for years. They took out thirty ounces coarse gold, several nuggets running over an ounce and one weighing an even $50. They are only running a day shift, the Lucky Dog. Co. using water from the same source at night. ——The Arizona Co. not only has plenty of water for their own use, but are selling some to the Nugget Co., which is working day and night. A number of properties are being worked by booming on Prichard creek, on Eagle and on Beaver as well.

At Bayhorse the Ramshorn and Skylark are each working a force of twelve men.——W. J. Treloar, who is operating the Democrat, is taking out some fair ore.——I. Christensen, in the Silver Brick, is doing development work. ——Chambers & Frazier have been running a tunnel in the North Star, but are now crosscutting toward a body of ore which is known to exist in the Silver Greek.

Avalanche: The mining situation was never more auspicious in Owyhee than now. The regular producers, Trade Dollar, Black Jack and DeLamar are on the increase, and new properties are more than meeting the expectations of the managers. The old Poorman has passed its dark days. The Cumberland is turning out ore and bullion; the water will at once be taken from the old Empire, and new work prosecuted; the South Central, which was closed last fall, will be started up; the Ontario is producing good ore; the Banner group will soon be working; good ore is being extracted at the Flint mines.——The Wagener arrastra at Silver City is grinding seven tons of ore daily from the Cumberland mine, and making satisfactory savings. A partial cleanup resulted in 350 pounds of dry amalgam.——The lessees on the Potosi have finished a satisfactory run of forty tons of ore and are taking out another lot. The ore is slightly refractory, but with the combination process and careful treatment they effected a saving of about 92 per cent of the assay value.——Pickering & Adams who have a lease on the Mary mine, will begin work at once.——It is reported that a good body of copper and silver ore has been opened in the Flint mines. The mill is running steadily. Two tons of concentrates and a ton of high grade ore were shipped recently.—— M. H. Jacob, representing an Eastern company will commence operations at the Empire mine soon.——During the past two years the Poorman has kept a small force on development work. The lattter work consists of a winze, sunk to a depth of 270 feet, with drifts at 50, 150 and 250 feet, these levels aggregating about 1150 feet. The general appearance of the mine is encouraging. The Poorman mill started last week. The mill is an electric-cyanide plant, and is connected with the mine by a Hallidie system bucket tram.——

W. Ottenbacker is developing a quartz claim near Idaho City. The ledge is 3 feet wide, and the ore milled $8 a ton.

UTAH.

In 1893 the Mercur district was treating 150 tons daily—the Mercur 100 tons and the Marion 50 tons. Now there are eight mills in the district, of capacities as below, and two more building: Golden Gate, 500 tons; Mercur, 325; Sacramento, 150; Northern Light, 300; La Cigale, 200; Geyser-Marion, 150; Sunshine, 100; Chloride Point, 100; total, 1825 tons. The Golden Gate has a capacity of 1000 tons daily and will soon be treating that amount. La Cigale, which has not begun operations on account of roasting facilities, has a capacity of 500 tons, and the same condition exists at the Sacramento. The Daisy and Overland mills, now building, will swell the total.——W. Vogel, Mgr. Silver King mine at Richfield, says that soon work will be commenced on a 10-stamp mill on the company's ground. The Silver King is one of the claims owned by the Deseret G. M. Co.

Mulrooney & Co. paid $30,000 for a half interest in the Bessardia and Dutch Empire claims at Mammoth. Prospect work will begin at once.——The ore output from the Central Eureka shows a fair percentage of copper.——The shaft on the Confidence mine, near State Line, has reached 120 feet on a vein of free-milling gold ore.——Brown & Higgs have secured a bond and lease on the Last Chance mine, near Lehi, for $30,000 and have begun work on the property.——Near El Monte, silver, copper and gold discoveries have been made and a town organized. The High Ore mine runs 19 per cent copper, $21 in gold and 1100 ounces silver per ton.——The Mercur Co. made its semi-monthly shipment of cyanides, aggregating 1000 pounds.——Sufficient money has been raised by the Anne M. Co. to complete the shaft to a depth of 500 feet, and work will be resumed at once.——A drift is being driven in ore in the Columbia, following a body of shipping ore, which runs from 40 to 50 per cent lead, 80 ounces silver and $2.30 gold. The vein is from 1½ to 2 feet in width.——Retimbering the Centennial-Eureka shaft at Eureka is completed, and shipments will be increased. The company has about 200 feet of stoping ground between the 950 and 1100 levels. The ore runs almost 20 per cent in copper, together with a fair value in gold.——The shipments from the Grand Central are kept to 1000 tons per month, and are divided between the silver-lead ores of the upper levels and the copper and gold from the ore body on the 700 level.——At the Horn Silver, near Frisco, 4000 tons a month are raised, of which 600 tons are marketed in crude form.——At the Washington, shipments have been temporarily suspended, although a good class of ore is being placed in the bins. The intention is to do a large amount of work on the property this season.——At the Galena, from which good ore was shipped last season, work has been temporarily suspended, because, as is stated, of a lack of money with which to proceed. The shaft has reached 200 feet, and shows a streak of ore running high in both silver and lead.——The South Swansea had six carloads of ore at the sampler and will follow with three more while no effort, said an officer in the company, is being made to tax its capacity.——In the Geyser-Marion a new ore body is reported that assays $4 per ton. The cost of extraction and treatment is calculated at $2 per ton.——Ore shipments from Silver City last week amounted to thirty-four carloads.——Work was resumed on the Deer Trail group at Marysvale.——Eight cars of silver and lead ore from the Niagara were shipped from Bingham.——Assays from the recent shipment from the Four Aces at Silver City show 49 per cent lead and 76 ounces silver.——The pumps at the Dalton & Lark, stopped a year ago because of the low prices of silver and lead, have been started. It is estimated that two weeks will be required to drain the mine.

The first shipment of ore from Alta for 1898 was sent out by the Darlington, amounting to sixty tons.——The Grizzly, which has made progress during the winter, will follow with 165 tons.——The City Rock, Tallejo and others will make their initial shipments; the whole reaching a total, perhaps, of 400 tons, that will net the owners, according to assays, about $30 a ton.——At the property of the Dexter M. Co. twenty stamps are dropping, and thirty will be dropping in a few days. The earnings of the Dexter last month amounted to $16,500.——The Mercur mill is crushing 325 tons a day when its ore bodies could be made to respond to a call for at least double that tonnage without effort.——The Sacramento is leaching the gold out of 150 tons a day, whereas it is capable of putting out as much more, while the same may be said of the Geyser-Marion.——It is said that the Goliath is crushing 400 tons daily.——At Tintic the Sioux-Ajax tunnel has reached 4261 feet, and while it is being driven forward to a connection with Sioux and Utah ground, some prospecting is to be done.——The Sioux plant is running on ores from Utah and a second-class lot from Lower Mammoth, while the stamps of the Mammoth are dropping on ores from its own property, which is supplying 175 tons a day.

Samuel Newhouse proposes to build a smelter at Salt Lake for Highland Boy ores from Bingham and a railroad thence to Salt Lake, all to be completed by Dec. 1st, '98.

At the Golden Gate, Mercur, it is reported two of the roasters are finished and in commission, one treating 175 tons daily, the other 75. Another two are about completed. Besides the 250 tons which daily go through the roasters, 250 tons of oxidized ore are being treated, bringing the output up to 500 tons a day at present. As soon as the roasters are all completed more arsenical and less oxidized ore will be treated.

A Green & Co., lessees of the Washington, broke into 2 feet of ore, which assays an average of 10 per cent copper.——There is some prospect that work will shortly resume on the Crown Point a copper property from which several shipments were made last year, and on which work was abandoned on account of water.——The Phœnix has resumed work and is in a big body of ore which will furnish business for the new concentrator, besides yielding good tonnage of first-class for shipment. ——The Montezuma made a thirty-ton shipment of first-class ore.——The 150-foot level of the Starlus is in 55 feet and is being pushed; a little water was encountered, but not sufficient to impede work. The face of the drift is in low-grade ore.——The Swan-Bemis concentrator is approaching completion. The plant will be ready to run by the 1st. It will begin with a number of contracts.——The Last Chance Co. are said to have struck a good grade of ore in the Hooper mine.——H. Joseph, interested in the Markham group, says the project to run a deep tunnel to tap that and other properties is now abandoned, and that a beginning may be made this fall.

MONTANA.

In his report of Montana mines for '97, speaking of Lewis and Clarke Co., E. B. Braden says:

The largest property in the county is that of the Montana M. Co., Ltd., at Marysville, the most important gold mine in the State. The development consists of eight miles of tunnels and entrances at the various levels. A depth of 1600 feet has been reached. The ore is free milling; the work employs 250 men.

During the summer of 1897 the Montana Co. erected a 400-ton cyanide plant three miles from Marysville, to work the tailings from their mills that had been recovered in settling dams, six miles below Marysville, two and one-half miles below the cyanide plant. A narrow-gauge railroad was built to connect the two. These tailings are prepared uniformly for treatment at the dam by plowing, harrowing and continuous working to pulverize the slime lumps. The material is then loaded into cars of three tons capacity each and are then delivered to the mill. This mill is the largest in Montana working by the cyanide process.

The tailings after leaving the cars pass in an almost continual stream to the sheet iron lining of the bins and out of the gates to a 24-inch four-ply belt conveyor, which conducts them to a revolving chute or distributor; and this in turn fills a vat 38 feet in diameter by 9 feet deep with 400 tons of tailings in about eight hours. The great advantage of filling a tank in this way is that it gives a charge of more uniform permeability than any other method.

There are four of these tailing vats, each with its bin, conveyor and distributor, and one is charged daily, thus giving four days to complete the treatment of each charge, which consists in saturation, lixiviation, washing and discharging. The latter is accomplished by sluicing with 2½-inch hose, the water being under a 60-foot head, through four side discharge doors and one bottom discharge gate in the center of the vat. By this method 400 tons are discharged in three hours or less at a total cost of less than 2 cents per ton.

The solution tanks are ten in number and consist of four precipitating tanks of California redwood, 22 feet in diameter by 14 feet 9 inches deep, and two storage or supply tanks, 38 feet in diameter by 9 feet deep. There are also two water tanks, 22 feet by 14 feet 9 inches, for the storage of 80,000 gallons of water.

The tailings are the lowest grade in gold of any now worked in this country, containing copper carbonates and sulphide tetrahedites, arsenical polybasite and ruby silver. The plant operates under very unfavorable climatic conditions, being in the most northern latitude of any known, but in October and November it exceeded the predictions of profit by nearly 50 per cent, and netted about double the return the company considered would justify the erection of the plant.

It is understood that the Boston & Montana is charging to the expense account and not to construction all the extensions and improvements at the Great Falls smelter, which ex-

tensions are being made with a view of increasing the output of copper from 60,000,000 to 90,000,000 pounds per annum. This will permit the treating of 1200 tons of rock per day instead of 800 tons as at present.

At Neihart, J. Hegener shipped three tons of ore that yielded eighty-nine ounces silver and $1.90 gold per ton. — Fitzsimmons & Co. shipped a carload of ore that yielded good returns.

Beager & Presley are developing a property near Libby. They have four claims. On one claim they have a vein 34 feet wide of good grade.——The *Inter Mountain* says that the Parrot Co. has broken the record in Butte in developing the shaft on the Bellona claim. The first 100 feet was completed in 28½ days. Only twelve men had been employed, three shifts of four men each. The shaft is three compartments of the usual size. ——H Eppel has leased the Deep Gulch placer at Garnet and will put a force to work.

Murphy Bros. struck a good vein on their property at Hassel.——The New Era Co. is milling a lot of second-class ore ——H. Kallis shipped five tons of ore from the McKinley mine to the smelter.——Lethlean & Cavanaugh started work on the John L.——Herbold & Cooper shipped a carload of high grade ore to the smelter from the Ontario mine.

The Rose mine at Basin is shipping good ore.——H. Anderson of Sheridan shipped 330 sacks of gold ore from the Union mine.——A. E. Gade sold a group of mines for $10,000 to H. A. Hull & Co., who will begin development work immediately.——Jennings & Steele, on the Whippoorwill at Neihart, have loaded twenty-five tons. The ore is rich in copper, besides lead and silver.——H. McConville, on the Pasadena mine near Clancy, took $800 from 40 feet of development shaft.——The car of ore shipped from the Mocking Bird, consisting of 37,900 pounds, netted $483 84.

The Montana O. P. Co., in addition to operating the Rarus mine, is developing the Big Bonanza near Walkerville; the Cora, on which a shaft is being sunk, and the Nippur mine, one of the oldest in the camp, from which frequent shipments of ore are being made. The same company is also developing a number of promising properties in British Columbia.——Glora & Mills shipped ore from the Ohio mine, in Jefferson county, that runs nearly six ounces in gold.——A three-compartment shaft is being made from the 350 level in the Michael Devitt to the surface, through which not only the Devitt will be worked but the Never Despair, will also be explored.——It is said that work is to be resumed on the Bimetallic-Granite Mountain combined properties at once. There is some talk of an electric plant being put up to supply power and light.——H. J. Reiling bought 500 acres of placer ground near Salmon City for $175,000. He will build a dredge this summer.——The Judge mine, near Castle, has 700 tons of ore ready for shipment.

WYOMING.

Near Evanston Maj. Glafcke begins development work on a large body of low-grade ore, the average assay of which is $8 per ton.

SOUTH DAKOTA.

The Highland Chief G. M. Co. will start their mill on the Champion mine, near Deadwood soon. There is a small force taking out ore. The ore body is large and, while it is not all high grade, much runs above the average

COLORADO.

The English owners of the Caledonia, near Cripple Creek, have not given up hope of developing the property into a pay proposition. They have expended in the neighborhood of $125,000 on the purchase of the claim and in development work. A contract was let to sink a new vertical shaft to a depth of 500 feet. It is to be 4½x9 feet in the clear.——Assays on samples from across the 8-foot body of ore in the Fluorine gave $58 and $76 a ton as averages. —— Murray & McCormick, on their lease on the Ingham, made a two-carload shipment that will average $50 per ton.——Last month the output of the Fluorine was 270 tons, which averaged $47.35, or a total of $12,842 03. The lowest lot sent out during the month yielded $30 and the highest $72.20 per ton. Up to the 1st of May there has been between $53,000 and $54,000 worth of ore marketed from the mine.——McCormack & Co. made a fifty-ton shipment of low grade ore from the Lindsay block.——The Grace Dollar Co. is averaging 200 tons a month from the new chute opened in making the connection from the new to the old shaft. The ore is of good grade.——A strike has been made on the Nellie V., owned by the Lexington Co., at a depth of 85 feet. One foot of quartz assays from $40 to $60 per ton.——The King Solomon M. Co. owns about 1000 acres of rich mineral land near Frisco, in addition to large tracts of mineral land in Park and El Paso counties; they will do extensive development work this summer. On Ruby mountain this same company is developing a body of mill ore a mile long, and over 20 feet wide, which runs from $5 to $10 per ton gold.——The present output of Robinson, Kokomo and Frisco camps is over 200 tons of smelting a day, and as soon as the roads get passable it will be increased to 400 tons.

The Gold Sovereign is shipping high grade mineral from four shafts. A seven-carload shipment was made that went $70 for the low grade and $136 for the first grade.——Some rich ore is being mined on the Garfield Con. There is a seam of ore from 1 to 3 inches wide. The property is producing at the rate of $1000 per day.——The Johnstone lease on the Republic is producing from $1200 to $1600 a day, the shipments averaging twenty tons and the ore running from three to four ounces.——Hoffman & Co. have been sending out a carload of ore a day from their lease on the Zeolite.——The heaviest shipments have been made the past week in Georgetown made for months. As spring advances each month shows an advance over the previous one in the amount of business transacted.——The Pederson mine, near Central City, is making daily shipments of about forty tons, and the ore is of a fair grade. A body of high grade ore has been opened in Lucky Guss, Cripple Creek, at 650 feet depth. About three wagonloads have been sacked since it was opened. Since the company turned it over to its employes to allow them on a leasing basis to get out their back wages, the twenty-seven men have earned from $7.35 to $7.85 each a day. They have had it on these terms for three months, and have an additional holding for three months.——Returns for the last shipment from the Pharmacist contained about eight tons and averaged $440 per ton.——The Victor is now producing about 100 tons per day. This mine could output 200 tons per day for months, but it is impossible on account of the condition of the roads to secure teams to transfer it to Goldfield. The Belt line track will not be laid to the camp much before the first of next month. Sinking below the 600-foot is in progress.—— The Strong continues to output from 75 to 100 tons per day. About four-fifths is sent to the chlorination mill and averages better than two ounces. The smelting ore runs from six to eight ounces.——A three-carload shipment to the smelter from the Granite was the first lot sent out for some time. The work of crosscutting for the vein is under way at the 700-foot level.——The Mary Alice is being operated by the San Antonio Co. under a $100,000 bond, which does not fall due for nearly twenty months. G. S. Fleming, Pittsburg, is president of the company. There is plenty of money in the treasury and a contract was let a few days ago to sink the two-compartment shaft to a depth of 400 feet. It is down 192 feet.——Shipments from the Jones shaft of the Pharmacist have been resumed. Four cars of ore—one of five-ounce smelter and three of good grade mill dirt—were made, and with them went sixty sacks of the stuff from the recovered chute from which heavy production was made from the 400-foot level.——The complete April returns from the Hull City placer show gross value of ore $38,636.35, the net smelter returns $29,123.96. This property is being worked by lessees and the royalties received by the company during April amounted to $7087.78. The royalties received in March amounted to $5621.37.

Another shipper has been opened in the zone extending from the Hull City placer, near Victor, making the fifth producing shaft of the Vindicator property.——Keith & Grube of the Wallace, in a crosscut at 125 feet depth, opened 3 feet of ore that assays $40.——A mill-run from the Frostburg mine, near Georgetown, returned 264 ounces silver to the ton. Over $700 was taken out in sinking the shaft 20 feet.——The Annetta M. & M. Co., operating the Griffith mine for the past year, took up their bond; the deeds call for $30,000. The company expended a large amount of money in putting a raise through from the tunnel to the upper workings, and opened one of the largest chimneys of ore ever found in the county. —— The Keystone, near Cripple Creek, made a good strike which was found by poor sub-lessees. There is 4 feet of ore that assays as high as $500 per ton. The entire body averages $150 per ton.——Jennings Bros. & Kerr are in good ore in their lease on the Lillian Leland. In the breast of the north drift the vein is 3 feet wide. From 2 to 3 inches of the vein filling is high-grade ore that assays from $1000 to $2000 to the ton. Alongside this there is 12 inches of quartz good for from three to four ounces. The last shipment of the high grade went a little less than $800 per ton.——Foley & King are averaging ten tons of mill ore a day from their block lease from the seventh level of the Los Angeles. There is a number of lessees working on the property, which is making a production of close to 500 tons a month.——Production from the Gold Coin is running at thirteen tons a day. The chute in the bottom has been drifted on for 350 feet. The hanging wall of the vein has not yet been reached. The distance between the walls at the 400-foot depth is 30 feet.——The Portland is keeping up its output of seventy-five tons a day, almost entirely from the chute toward the Independence end line, worked through the 700 and 800 foot levels. The ore in the Hidden Treasure is being taken out only in development and no shipment of this will be made until the mine meets with some accident or some unforeseen contingency arises to check production from the other parts of the mine—at least, this is the last plan announced by the company. Between twenty-five and thirty tons of the high-grade stuff is stored in the bins under ground.——The Ingham was closed on orders from the Colorado Springs office. Under a former management, this property in seven months netted $51,000.——Sigsbee & Co., sub-leasing on the Keystone, have reopened in the 80-foot level the chute from which Fogleman & Smith made heavy production a year ago. They found 4 feet of ore that assays from $46 to $580 a ton.——The new compressor of the Orphan Belle is in operation and production has been restored to the daily average of thirty tons. A large amount of development work is being done on the property.——A seven-acre fraction near Victor was sold to W. Hayns of Ypsilanti, Mich., for $15,000, the sellers being a number of miners who have owned the claim for a long time. Since the Woods Investment Co. purchased the Uinta tunnel and the Big Banta group for the Battle Mountain Con. Co., Mayor Doyle has given an option on the stock interest which he retained as one of the provisions of that transaction. The consideration involved is large, as Mr. Doyle is said to be the owner of 200,000 shares of the Uinta stock.——The management of the Blue Bird has decided to develop that property on the co-operative plan. They propose to give 300 miners an opportunity to work the property with them. The company is to supply powder, tools, etc. The Blue Bird is equipped with a plant of machinery, and is said to have good ore in all the levels. The present output of the mine averages a carload of ore daily. A three-car shipment was sent out which is expected to return $70 per ton.

Lessees on the Mollie Kathleen at Cripple Creek are again in good ore, the 12-inch streak in the 60-foot level averaging $50 per ton without assorting.——The Hidden Treasure has sacked forty tons of very high grade from the rich strike on the 700-foot level. On the 800 level the ore body is larger and richer than above. A good ore reserve is being maintained and the output is kept up only to the amount of the expense account and the $45,000 monthly dividend. —— One hundred feet greater depth is to be given the Nellie V. The rich streak of $356 a ton ore continues small at present depth.——The Dead Pine, Granite and Last Dollar are sacking ore ready for shipment as soon as the Golden Circle road reaches the Victor. The Victor has 150 tons for shipment.——Good ore is again being taken out by the lessees on the C. C. Con. properties. The ore runs from $50 up.—Work has resumed on the Red Cloud at Whitehorn, from which a mill run was shipped that netted $22 per ton.——The Prairie shipped two carloads of ore which according to assay tests ranges from $50 to $100 in gold per ton.—The Chance is again at work. Two veins 15 feet apart were opened. The wider vein is 9 feet and averages $5 in gold. The other vein is but 2 feet wide, but runs $33 in gold per ton.——Commissioner of Mines Lee in his report for the mineral production of Colorado for 1897 presents the following summary: Gold, 947,-249 ounces, $19,579,636 83; silver, 21,278,202 ounces, $12,692,447.47; copper, 9,151,592 pounds, $960,917.13; Lead, 80,799,778 pounds, $2,731,-032.48; total; $35,964,033.92.——While the experts are preparing for the litigation between it and the Portland, the Strong continues its daily output at from sixty to seventy tons a day, about two-thirds going to the mills and one-third to the smelter. For the past three weeks a number of experts have been making examinations of the Portland and the Strong underground workings, and it is understood that both sides are now ready for the suit.

The greatest depth reached on the Silver Ledge mine, near Ouray, is 400 feet. There is ore blocked out nearly all the way bearing gold, silver, lead and zinc. The property has a mill of fifty tons capacity which the management contemplates enlarging. The property is owned by Denver men.——The Mildrum tunnel is being pushed from the Ironton end as fast as it is possible in the formation, the men working at a disadvantage in the slide rock. As soon as a solid formation is met, which is expected about the end of the present month, air drills will be installed and the work pushed to completion.——The Congress mine is a steady shipper. The principal value in the ore is the copper, although gold and silver are found.——L. R. Frye will start the Saratoga and will have a small force at work by the 15th.——The American Nettie and O. & N. are sending regular shipments of high-grade ore.——The Black Girl is being worked under bond by Du Praw and Hagerty. They are making steady shipments.——Senator Newman will soon put a considerable force at work on a group near Ironton, which has been secured by him for an Eastern company. The group comprises the Baltic and Mono, J. I. C. group of five claims, the Maud S. and the Brooklyn. These mines constitute the largest area of pyritic ores in this section, and all carry copper-bearing ore, besides values in gold, silver and lead. When shipments of high-grade ore were made from this group in the past the low-grade ores could not be handled with profit. These will now be transported to the smelter for treatment.——Thirty-five men were put to work at the Virginius mine on May 1st, and it is expected that the management will increase this force to 100 by June 1st.——Eight inches of $1000 ore is reported from the fifth level of the Garfield Con. at Cripple Creek.——Up to date Rico mines have shipped 310 cars of ore since January 1, 1898. The gain over last year is about 155 carloads.——The Dolores river placers are being sunk to bedrock and extensive work is laid out for the season.——The Battle Mountain mines of Eagle county shipped 11,380 tons of ore since January 1st. The Black Iron and Belden mines are the principal shippers, having shipped nearly 3000 tons.——The First Chance Con. has given a three years' lease at 15 per cent royalty. It has a plant of machinery and work will commence immediately.——The St. Louis-Gunnell mine, Clear Creek, is keeping two 5-stamp mills busy on ore from the property.——The Pittsburg is steadily shipping with good results.——In the Pay Rock a 10-inch streak of smelting ore has been struck which gives $319.18 a ton, over half of which is in gold.

The output of the Pride of the West mine, near Silverton, will be twenty tons daily.——The Aspen is shipping eight carloads per month.——The Lady Ellen mine has four carloads of high grade ore ready for shipment. The Gold Crown mine has a 350-foot tunnel, which cuts three parallel veins containing iron ore that averages from $5 to $9 per ton gold. The property has another small vein that carries 1½ ounces gold per ton.——Fifteen men are at work on the Ridgeway mine.——The Sampler is handling sixty tons of ore daily.——Paine Bros. are packing twenty-five tons of ore daily from the Black Diamond mine.——The Temptation mine is being rapidly developed. Capt. Freeman, the owner, contemplates the construction of a mill during the summer.——The Congress mine has been a heavy shipper all winter. Its ore body is 30 to 40 feet wide. The Congress ore is a copper product running, it is said, over 23 per cent.

Record: The new placer operations in the Swan and Blue River valleys during the season will be on a larger scale than any work of the kind in the Breckenridge gold belt. It has been ascertained by means of bedrock shafts, some five or six having been sunk, that the nugget-bearing stratum of the alluvium of these streams is unusually rich in coarse gold.——The North American G. D. Co., which is operating the consolidated placers of the Swan River valley, has started dredge No. 1 to work; No. 2 will probably be ready for work by June 1st. The dredging plants are complete and include the pumps for use when the bedrock is to be cleaned up. The plants are to be operated day and night during the season; the boats are supplied with electric lights and will be connected by telephone with the manager's residence. The lower portion of the placer will be worked with giants and hydraulic lifts.——The Pence-Miller Placer M. Co. is working seventy men on the new ditch, which they hope to complete within thirty days. The ditch will deliver water with a head of nearly 240 feet. It is believed to be from 40 to 50 feet to bedrock at the place selected to begin operations.

NEW MEXICO.

The shaft of the Dixie at Organ is down 200 feet.——Good ore is being taken from the Gold Standard mine at Golden.——A body of ore has been struck in the Klondike mine at Organ.——Eight men are developing the Benton mine at Dolores. A shipment of twenty tons of ore was made.——At Pinos Alton six quartz mills are running.——J. B. Mayo is shipping ore from the Old Reliable M. Co.'s property to Golden.——The North Homestake mine at White Oaks will resume work.

G. A. Bennett is shipping high grade galena from his claims at Organ.——The output from the Hillsboro mines since January is 3030 tons.——The Stella mine at Red River has several thousand tons of ore on the dump running $27 per ton. It is said the owners contemplate building a mill.

C. F. Easley made final entry and purchase at the U. S. land office in Santa Fe of the Albemarle, Huron, Ontario and Pimlico mining claims, comprising the Albemarle group, in the Cochiti district, for T. Lowthian and others. The group consists of seventy-eight acres of mineral land and is under bond to O. P. Posey et al.

ARIZONA.

J. A. Fleming, Pres. Black Warrior Copper Co., has men employed taking out ore to be smelted at the United Globe smelter. There will be about 700 tons of ore to be moved.——A conservative estimate places the copper output of Arizona at 5000 tons per month.——Doran & Blaufeldt have taken a bond on the Accidental mine, near Prescott, which has been abandoned many years. They will sink 300 feet, run levels and thoroughly explore the property.

At the Norma and Occident of the White Hills M. Co.'s group, in Mohave county, ore is being taken out which carries 450 ounces of silver per ton. Only twenty of the fifty stamps are running owing to the scarcity of water.——The ore from the Longfellow mine, near Prescott, gives an assay value of $56 in gold per ton.——The gold in the Relief mine, near Phœnix, is found in granite. The vein is irregular and rich and large enough to pay well.——Mohave county has three new 10-stamp mills working on ore from the Klondike, Sheep Trail and O. K. mines.——J. Roberts has an 18-inch ledge on his Ida May mine, in Yavapai county, which goes $30 per ton in gold.——At the mines of the Santa Maria G. Co., in Yavapai county, thousands of dollars have been invested in the erection of a cyanide plant, the building of roads and the opening of the mines. The principal mines are the Waters and the Standard. In the former a large body of high-grade ore has been struck and a contract has been let to sink 600 feet on the property. In a few days the stamps will begin dropping on a 10,000-ton test run of Standard ore.——The dividends paid by the Homestake mine for 1897 are said to be $437,000, an increase over 1896 of $92,000. The average grade of ore yielded less than $4 a ton.——The Saginaw M. Co. has taken a working bond on the Twin Buttes mines, price $60,000, of which $3000 was paid down. The company also pays $2 royalty on all ore extracted and reduced. The Twin Buttes mines are copper properties.——The Copper Queen Co. at Bisbee is shipping a carload of copper matte to Agua Caliente daily. This matte is used by the company there as a flux, it being about 45 per cent copper. These shipments average about 50,000 pounds.

The shaft of the Elkhart, at Chloride, is down 304 feet, and the third station is being cut.——It is reported that some of the high grade copper ore at Bisbee runs 79.4 per cent in copper, 135 ounces silver and a few dollars in gold to the ton.——Six 200-pound bars of bullion departed for the San Francisco mint from Williams—the product of the White Hills Co.'s mines.——A new chute of ore has been struck in the Altata mine of high grade.——The Morris Bros., at Polomas, discovered ore in their property, of which three assays resulted in $16, $60 and $110 per ton.——The

A GOOD INVESTMENT

Three Dollars Brings This Paper One Year==Fifty=Two Issues.
Can You Afford To Be Without It?

Security Development Co. will erect a matting furnace at Chloride to handle the ores from the Elkhart mine.——The Decatur Copper Co. of Decatur, Ill., is pushing development work on its property near Jerome. Mr. Mullarkey, lately appointed Supt., has assumed charge. The work being done is sinking a shaft a depth of 200 feet.——The News mine, near Phœnix, is showing up well. At 65 feet a crosscut shows 20 feet of mineralized slate. There are twenty tons of ore on the dump.

The contractors having in charge the building of the railroad from Geronimo to Globe, find that the difficult point of construction is is at the Gila river across which a bridge of 900 feet must be thrown possibly over quicksands. The smelters at the Old Dominion mine may not be started until the fall.——The Juniper mine of Don Dabezas, Cochise county, is reported sold to R. A. F. Penrose for $75,000.

AUSTRALIA.

At the Broken Hill Proprietary 25,019 tons of ore were treated for the four weeks ending April 28, including product from ores purchased, and the output from the refinery was 487,155 ounces of silver, 2390 tons of lead, and fifty-seven tons of antimonial lead, the copper matter containing twenty-two tons of copper and 22,304 ounces of silver.

C. Y. O'Connor, engineer-in-chief of western Australia, has returns showing that the population of the Coolgardie gold fields, not including outlying districts, is 37,560, who pay £835 a day for the water they consume, the miners pay another £290 a day similarly, a total of £410,-625. When the water supply scheme is carried out the same quantity of water—about 50,000,000 gallons per annum—will be supplied at a cost of about £10,000 per annum ! The new scheme (editorially described herein in the issue of March 12, '98), will provide 1,800,000,000 gallons a year, at a cost of £320,000.

MEXICO.

The Compania Minera Expl. has been organized to develop a property at El Oro. R. E. King is Pres. and L. C. Camargo Sec. The capital is $200,000.

The Rincon y Anexas mines of Temescaltepcas are erecting pumping machinery, with a capacity of 700 gallons per minute, to be operated by heated compressed air. Flumes and ditch have been constructed to deliver 400 H. P. at the mine.——At El Truinfor the Progresso M. Co. is employing 1500 men.——S. Katzenstein is operating a copper property in the same neighborhood on a large scale.——The Railroad mine, near Alamos, Sonora, is shipping from $10,000 to $20,000 gold bullion a month.——Near Jupicari the Esperanza Co., a Kansas City corporation, is opening extensive placer ground. The company is organized with a capital of $600,000.——W. S. Morrow has begun development work near Minas Prietas. On one of the properties some work has been done that shows 30 feet of $10 ore. Requisite machinery will be placed as soon as the mines are sufficiently developed to produce 300 tons of ore daily.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DENTAL IMPRESSION MATERIAL. — Louis White, San Francisco, Cal. No. 603,803. Dated May 10, 1898. This invention relates to an improvement in the formation of dental matrices. It consists, essentially, in the employment of a suitable plastic material so prepared that it may be employed for forming an accurate mold of the cusps or the surfaces of the teeth and other adjacent parts. Said mold to be afterwards filled with plaster of paris; and from the facsimile thus produced teeth can be made and fitted in any usual or well known manner.

HAY-COCKING MACHINES.—William H. Frazine, Montpellier, Cal. No. 603,816. Dated May 10, 1898. This invention relates to an apparatus which is especially designed for cocking hay after it has been cut in the field. It consists of an attachment to the mowing machine of a horizontally traveling carrying belt upon which the cut grass is received, an inclined elevating belt running essentially at right angles therewith, by which the hay is carried upward, a basket suspended upon trunnion shaft and in such a manner that the hay will be delivered into it until the basket is filled; a means for revolving the basket when full so as to discharge the hay in a cock or bunch upon the ground, after which the basket is again returned to its normal position to receive another load. The basket has a movable side, so arranged that the bottom is allowed to swing inwardly about a hinged support, and the weight acts to help discharge the grass from the basket when the latter is inverted.

Personal.

W. F. DETERT, Supt. Zeila mine, Jackson, Cal., is in San Francisco.

E. M. MAHILL takes charge of a mine at Teozintlan, Puebla, Mexico.

F. ROBBINS has been appointed Supt. Lone Pine mine, Republic, Wash.

V. B. DE LASHMUTT becomes Supt. Eureka Queen mine, Republic, Wash.

COLORADO'S STATE GEOLOGIST, T. A. Rickard, is visiting San Francisco.

W. C. RALSTON, San Francisco, is at the Ralston mine, Placer Co., Cal.

J. WATSON, Supt. Norambagua mine, Grass Valley, Cal., is in San Francisco.

F. J. MARTIN, Supt. La Fortuna mine, Yuma, Ariz., is in San Francisco.

F. W. PAGE has resigned Gen. Mgr. Pennsylvania mine, Brown's Valley, Cal.

C. E. STEVENS is the newly elected Mgr. of the Hercules G. M. Co., Victor, Colo.

W. H. CLEARY JR., Supt. Petticoat mine, Railroad Flat, Cal., is in San Francisco.

J. DAGGETT, San Francisco, is examining his mining properties at Georgetown, Cal.

R. C. CHAMBERS, Gen. Mgr. Ontario mine, Park City, Utah, has returned home from the Slocan.

SUPT. ROSS of the Wildman-Mahoney mine, Sutter Creek, Cal., has returned home from the East.

J. J. LEVENTON, owner Leventon mine, Fairplay, Cal., has returned home from San Francisco.

I. L. MOORE, Supt. Lucky Marion M. Co., Greenwood, Cal., has returned to the mine from St. Louis.

D. KIETH, Mgr. Silver King mine, Park City, Utah, is visiting his mining properties at Baker City, Or.

C. MULKEY, managing owner Spreckels-Mulkey mine, Fairplay, Cal., leaves for Kotzebue sound next Monday.

J. H. WEDDLE of the Con. Kansas City Smelting and Refining Co. has returned to Leadville, Colo., from a sojourn in Cala.

M. B. KERR left San Francisco last Thursday on a two months' professional visit to Costa Rica. He will return via Washington, D. C.

CHAS. D. LANE and a party of gold miners left San Francisco on the 15th, outfitted for a two years' expedition to Kotzebue sound, Alaska.

R. T. BAYLISS, formerly Mgr. Montana M. Co., now succeeds Hamilton Smith as one of the managing directors of the Exploration Co. of London.

HUBERT VISSCHER of the U. S. Debris Commission has men digging holes in the channel of the Yuba, Cal., river one mile from Timbuctoo, to determine the depth and deduce data for a draft of restraining wall foundation at that point.

CAPT. J. F. PRATT of the U. S. Geological Survey is in San Francisco arranging for transportation and supplies for his Yukon river exploration party. He will survey the Yukon river this summer. Congress has appropriated $10,000 for the work.

THE Butte County, Cal., Miners' Association has elected delegates as follows to attend the International Mining Congress which is to be held in Salt Lake City on the 7th, 8th and 9th of July: A. W. Gassaway, Supt. Magalia mine; G. H. Evans, Supt. Banner mine; E. Murray, Supt. Enterprise mines; E. W. Duncan Sr. and A. Ekman, of Oroville.

J. H. NEFF, Pres. Cal. State Miners' Association, is in San Francisco selecting delegates to the Salt Lake Mining Congress. On Thursday he appointed the following-named as delegates to the International Mining Congress, to be held in Salt Lake City on the 6th, 7th, 8th and 9th of July, 1898: C. W. Cross, Col. W. S. Keys, M. W. Mather, H. E. Pickett, Tirey L. Ford, Robert McMurry, W. C. Ralston, A. Caminetti, Col. George Stone, E. H. Chapman, Wm. Irelan.

Coast Industrial Notes.

—The value of the fishery product of the Province of British Columbia in 1897 was $5,-834,764.90.

—Tucson has voted $100,000 bonds for water works, the third Arizona town which has voted water works bonds in '98.

—The B. C. Legislature has passed a bill forbidding the employment of Chinese and Japanese on all works carried on under a provincial charter.

—The domestic shipments of redwood from Humboldt, Mendocino and Del Norte counties, Cal., during April were 12,789 M. feet; foreign shipments, 1002 M. feet.

—The Pacific Rolling Mills announce a closing up and retirement from business. There are outstanding claims aggregating $800,000, the greater part of which in time may be liquidated.

—The Astoria, Or., & Columbia River railroad was opened for traffic on the 16th. The new line connects with the Northern Pacific at Goble and with the Southern Pacific and O. R. & N. Co. at Portland.

—In consequence of the drouth the loss to California in the value of its wheat crop will amount to $15,000,000. The loss to the fruit crop is estimated at $5,000,000 and that to sheep and cattle at another $5,000,000.

—A furniture car made by the N. P. Ry. Co. at its shops in South Tacoma, Wash., will be placed on exhibition in Omaha, as an advertisement of coast lumber. It is 42 feet in length, capacity 70,000 pounds, finished in oil. The car is built of fir, cedar, spruce, and oak in door frames.

—The Pacific Coast Elevator Co.'s entire system of warehouses and elevators in Oregon, Washington and Idaho has passed out of the control of F. H. Peavy & Co. of Minneapolis and is now the property of T. Wilcox and W. M. and C. E. Ladd of Portland. In the three States there are seventy warehouses and elevators, and the entire plant has a capacity of about 5,000,000 bushels of wheat. The consideration is understood to have been $1,000,000.

—President Ripley of the Santa Fe railroad denies that the line of steamships which it is proposed to run between San Diego and Yokohama is operated by his railroad company, but admits that negotiations have been concluded for a traffic contract with the railroad. Steamship lines are not run because Tacoma, Portland, Victoria and San Diego have better harbors, or are more convenient than San Francisco, but only because certain transcontinental railroads have their termini in these places. The Oakland *Enquirer* thinks that these railroads, which have been shut out of San Francisco by the exclusive policy of the Southern Pacific Co., are now taking their revenge.

—A letter from Ecuador says: "As to lumber, I doubt if there is a modern sawmill or planing establishment in the country. Such boards as I have seen made have been sawed out by hand from the logs, one man standing on top of the log and pulling the saw, while another below furnishes the force for the downward strokes. The most of the lumber used on the coast and on this river is brought from Oregon and Puget sound, and it often sells as high as 10 cents a foot. Georgia pine is brought around Cape Horn, a distance, I judge, of about 8000 miles. All imported lumber pays a duty of about 1 cent for every eight pounds, and in addition to this one of 30 per cent ad valorem."

—Consul McCunn of Dunfermline, Scotland, writes: "I deem it of sufficient importance to report that California barley received in this consulate is considered of an excellent quality; the malting capabilities are perfect. The preference here for California barley is so marked that it is said a reduction in the price of Scotch barley is sure to follow. American flour, though, is looked upon with suspicion, owing to the fact that it is believed to be mixed with corn, ground exceedingly fine. I have it from unquestionable authority that four out of nine samples of American flour tested within the past three weeks are alleged to contain 10 per cent of corn flour. The high price of wheat and the low price of corn are believed to have led unscrupulous millers to adulterate their flour in this manner. If this adulteration is not speedily checked, it will expose the American flour trade to great danger, the effects of which will be far reaching."

The State Mining Bureau of California has issued the following statistics of petroleum production in southern California during the year 1897:

Los Angeles County.	*Barrels.*
City of Los Angeles	1,073,011
P. C. O. oil, Newhall	145,000
Puente	95,000
Central Oil Co., Whittier	14,000
Santa Fe Railroad wells	12,000
Total Los Angeles County	1,339,011
Ventura County	368,228
Santa Barbara County	130,136
Total Southern California	1,837,429

The output of the Coalinga field, Fresno county, for 1897 is said to be 70,000 barrels. Adding to this the output of the Moody Gulch wells in Santa Clara (about 50,000 barrels) brings the total output of petroleum in California for 1897 to nearly 2,000,000 barrels, an increase of about 750,000 barrels over 1896.

Telegraphy in War.

The battle of Manila offers an illustration of the wisdom of having experts in telegraphy and electrical engineering attached to every army or fleet. It ought not to have been necessary to keep the world so long in ignorance of what Commodore Dewey had actually accomplished. If the electrical end of his establishment had been cared for as scrupulously as its strictly fighting end, he could have made his victory even more complete in its moral effect by showing the Spaniards the hopelessness of a war against so ingenious a people as ours. It should be the care of every commander of an army or a fleet to have with him a small corps of men who not only understand the working of the telegraph key and read messages by sound, but are shrewd enough to do a thousand things in the way of repairing and emergency work which may be called for when no outside aid can be procured. These men should understand splicing wire and cable in any condition and amid any surroundings. They should be of trained ingenuity in running down and locating breaks in the connection. They should have enough sobriety of judgment to be able to play the censor if necessary on dispatches put into their hands to send. They should be telegraphic geographers, as well as everything else, having at their fingers' ends the directions and junctions of telegraph lines all over the earth, for it sometimes becomes of the very first importance to send a message to the other side of the enemy's country without actually passing through it.

The use of electricity in warfare has grown very much within the last ten or fifteen years, but the war between Spain and the United States promises to do more to illustrate the possibility of this branch of science than has been dreamed of heretofore. Telegraphy and telephony will both be called into play to do what has formerly been done by wig-wag signals, sending dispatches by courier, etc. Telegraph wire has been reduced so in weight that a man can transport two miles of insulated double conductors as rapidly as a column of cavalry can move. This includes the weight of the reel for paying out the wire, as well as of the wire itself. The flying field telegraph and telephone makes a kit weighing not to exceed thirteen pounds, and this includes a diminutive Morse key and buzzer, so that messages can be sent simultaneously from both instruments.

ALASKA and KOTZEBUE SOUND STEAMERS.

JOHNSON-LOCKE MERCANTILE COMPANY, Agents, "GOLD PICK LINE,"

609 MARKET STREET, SAN FRANCISCO, WILL DISPATCH THE FOLLOWING FIRST-CLASS STEAMERS:

May 28th, for KOTZEBUE SOUND. DUTCH HARBOR, NUNIVAK ISLAND, HOOPER'S BAY, ST. MICHAEL and DAWSON CITY, the newly built triple expansion steamer "**GRACE DOLLAR.**" Upon arrival in ST. MICHAEL passengers for DAWSON CITY will be transferred to the newly built, highly powered river boats and barges "**RIDEOUT,**" "**GOLD STAR,**" "**PINAFORE**" and others. The "**GRACE DOLLAR**" then will proceed without delay to KOTZEBUE SOUND, where passengers will be disembarked and placed upon the river steamer "**ARCTIC BIRD**" and will be given free passage up the Putnam River as far as FORT COSMOS. The Pacific Coast and Kotzebue Sound Transportation and Trading Company will also maintain at KOTZEBUE SOUND a Warehouse. Parties contemplating a trip to KOTZEBUE SOUND are strongly advised to take passage on the "**GRACE DOLLAR.**" She has a newly built triple expansion engine for the highest power; her bows will be sheathed so as to permit her making her way through the breaking ice; and the "**GRACE DOLLAR**" without question will be the first vessel reaching KOTZEBUE SOUND this year.

May 25th, JOHNSON-LOCKE MERCANTILE COMPANY, Agents, Will dispatch for DUTCH HARBOR, NUNIVAK ISLAND, HOOPER'S BAY, ST. MICHAEL and DAWSON CITY, the Steamship "**TILLAMOOK,**" Connecting at ST. MICHAEL with the Steamers "**STAGHOUND,**" "**GAME COCK,**" "**CITY OF DAWSON,**" and other boats.

June 1st, JOHNSON-LOCKE MERCANTILE COMPANY, Agents, will dispatch for ST. MICHAEL, DAWSON CITY, and YUKON RIVER POINTS, the magnificent Steamer "**MORGAN CITY.**" Capacity 700 passengers and 2000 tons freight. The "**MORGAN CITY**" connects at ST. MICHAEL with the "**GAME COCK,**" "**STAGHOUND,**" "**POWELL,**" "**ALVISO,**" "**RIDEOUT,**" "**GOLD STAR**" and "**CLAN MACDONALD.**"

Sailings of three additional ocean steamers early in June will be announced by us within a few days. Passenger and Freight Office

JOHNSON-LOCKE MERCANTILE COMPANY, 609 Market Street, San Francisco; 112 Yessler Way, Seattle; 809 Home Insurance Building, Chicago.

Some Pacific Coast Timber.

The timber of British Columbia, Washington and Oregon is practically the same, Douglas fir, the leading lumber of the northwest coast and the one timber accessible to all its mills. It grows only west of the coast range of mountains, in large tracts. The fir timber cut by the Washington and Oregon mills rarely yields 25 per cent clear, nor 50 per cent good enough for shipment to foreign ports. The disposition of the rough and lower grades is the conundrum of the mill man. For years California has been the market where these low grades were marketed, but this market is growing more particular. The better mills are, however, working their stock more carefully and are getting better returns in the upper grades than in former years. In the better districts it is often found 8 feet in diameter, sometimes 9, occasionally 10, very seldom larger.

The cedar of the two northern States is the next in importance. It grows to immense size. There are few tracts of cedar exclusively; the majority of it grows with fir, spruce or hemlock. It is the greatest shingle timber. The trade in shingles has grown in a decade from nothing to nearly three billions annually. They are marketed in every Eastern and Northern State. A few shipments are made abroad, but so far that demand is limited. Cedar sash, doors, finish and siding are rapidly finding a market. The doors and sash of this wood will stand in any climate. They will hold their own under any test. The cedar timber is worked at great loss; clear cedar is not easily obtained and wide stock is always a problem to the mill owners.

Spruce grows only in favored localities and generally within limited areas. It is found at its best in the counties that border on the Pacific ocean. South of the Straits of Juan de Fuca, near the California line, is found the great bodies of spruce. Some small patches and detached trees are found elsewhere, but much of this is of the tide land variety, which is only good for boxes and the cheaper grades of lumber. There are but a very few mills that can fill orders for spruce. It is one of the most valuable timbers there, much resembles white pine, and can readily be sold for it.

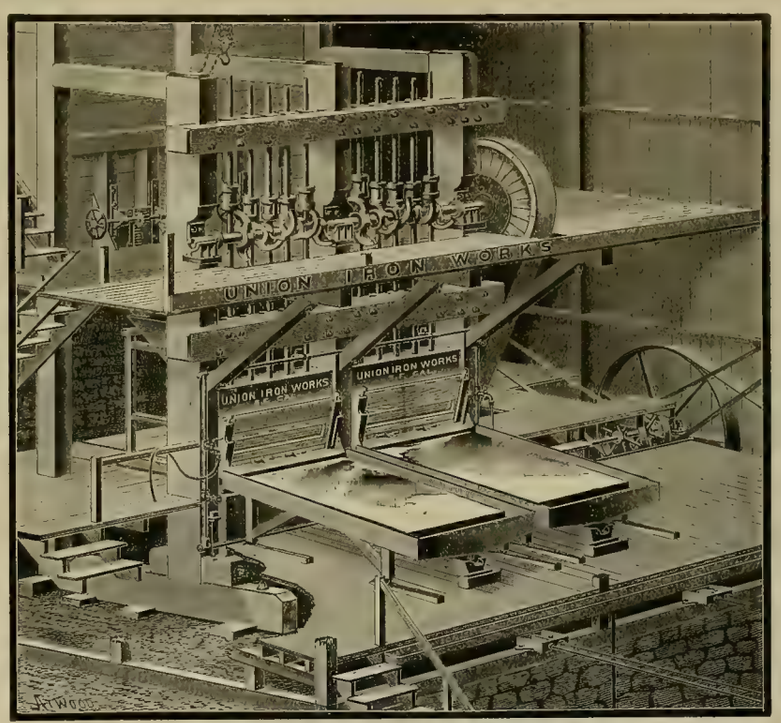
Hemlock is yet unknown in the markets, only a limited amount is manufactured and but a small portion of that is sold as hemlock. It will pass either for fir or hemlock in a mixed pile. It makes good flooring and a handsome finishing lumber. It has none of the bad features of Eastern hemlock. It is like spruce in being tasteless.

Larch grows in a few localities and is good timber, light in color and weight, difficult to distinguish from spruce or the lighter colored firs.

In the southern part of Oregon is found the great body of sugar pine—a valuable timber, but its sale is much restricted on account of the railway facilities. The lumber is coarse-grained, light in color and takes a good finish. Sash, doors and finish and all kinds of building material are manufactured from it.

East of the coast range of mountains is found bull pine, tamarack, some white pine and cedar. There are few large bodies and but little good lumber is manufactured. Bull pine is the principal stock cut. It has a heavy sap, which turns blue or black, warps easily and is fit only for rough work.

In southern Oregon and California is found considerable oak, which is not found in the territory farther north.



California redwood is the great staple of the northwestern part of the State, but in the mountains there is cut much other lumber that is seldom noted. The demand for boxes in California is largely supplied from this mountain timber, though redwood, spruce and sugar pine boxes are manufactured quite extensively.

The redwood of California is destined to have a greater future than its past indicates. Its shipments have been hampered by need of shipping facilities. The lumbermen of the State have had a good market at home, some abroad, and have not pushed redwood into the Eastern markets. Redwood shingles are equal to any made. The redwood timber is so nearly clear that from it shingles can be manufactured at a low cost. Redwood lumber has valuable features—it is as nearly fireproof as wood can be, it is durable above or below ground.

Ten Stamp Battery.

The illustration presented herewith is one taken from the proof sheets of the new catalogue, No. 5 (soon to be issued by the Union Iron Works), on the subject of "Metallurgical Machinery." It shows the details of a modern 10-stamp battery so completely that our readers require little or no description. The battery is of the design known as the back-knee type, driven by belt and tightener from a shaft located upon the battery frame sills below the mortars. The drawing plainly illustrates not only the battery and its various parts, but also shows the ore-bin gate, feeders, copper apron plates and water piping, all in their relative positions.

The perspective of the drawing is perfect, and to those familiar with quartz-mill work the fine details will be appreciated.

Copyrighted.

MODERN TEN-STAMP BATTERY.

The Treadwell Mine.

The Treadwell mine is on Douglas Island, Alaska, almost opposite Juneau. The island is twenty-eight miles long by fourteen miles broad and is about 4000 feet high. Most of the island is rugged and rocky and is covered with small timber. There are numerous ravines about the island, and as there is considerable rain there these ravines catch water enough to supply the power for the mines all the time everything is not frozen. There is a ditch which runs almost entirely about the island to catch the water, and this supplies the power. As the mines run all the year round, when the water is frozen steam is used.

The Treadwell mine has 240 stamps, each weighing 950 pounds, which fall ninety times a minute night and day. The number will shortly be more than doubled.

The ore is free milling and runs about $3 to $3.50 per ton, probably the lowest-grade ore mined anywhere in the world, and it could not be handled successfully but for the nature of the mine. It is not underground mining; it is taken out like rock from a quarry, and has been mined for $1.28 a ton.

Jordan Narrows, Utah, Plant.

A water and electrical power plant is now under construction on the Jordan river, along the Rio Grande Western railway, twenty-two miles south of Salt Lake City. The Jordan river is the outlet of Utah lake, and where it passes through the "Jordan Narrows" it has considerable fall, affording a good opportunity for the development of water power. Last summer a company was formed to utilize this, and within the past three months great progress has been made toward the construction of a plant.

There are several large irrigation canals taken out of the river within the "Narrows," and the right to use one of these—the Utah and Salt Lake—was purchased. The water for the power plant is thus conveyed from the head of the river's rapid fall to the lower end, where the power plant is located.

The canal runs through a very rough country, and no pains have been spared in its enlargement to meet the demands of the power plant to leave all to be returned to each of these to compensate for the taking out of the water above their headgates. Two different heads, one of 54 feet and one of 74 feet, can thus be used on any turbine, according to necessity.

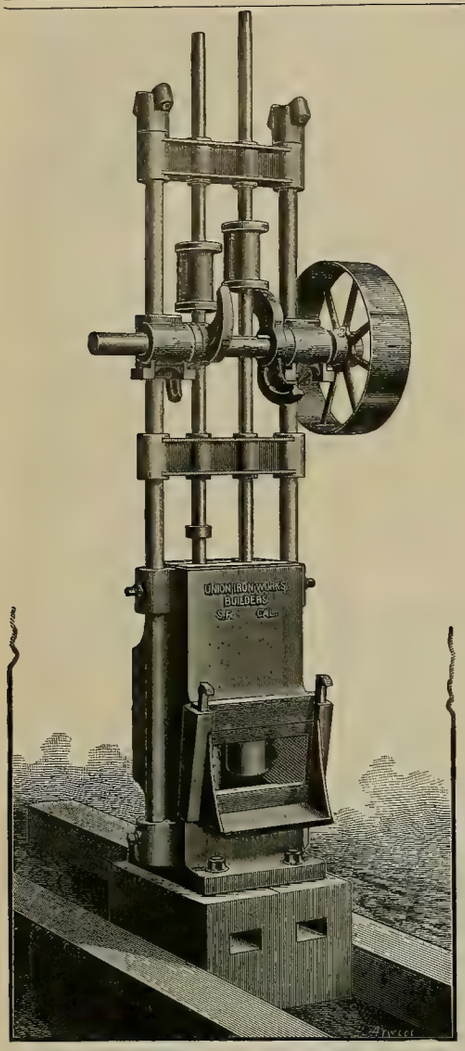
There will be four 500-K. W., three-phase, 300 revolutions per minute generators, one direct connected to each turbine. The Westinghouse system of electrical machinery will be used throughout.

At the present time the canal (except the two longer flumes) is finished; the very heavy excavations for pressure pipes, the wheel-pit and the power house are completed; the pipe and connections and the casings for the turbines are on the ground. The power house, of heavy concrete and brick masonry, will shortly be started, and it is expected to begin delivering power to Bingham and Mercur as early as June 15th, the final surveys having been made and the poles distributed.—W. P. Hardesty, in Engineering News.

construction as substantial as possible. The old canal has been widened and deepened to four times its former capacity, and will now carry 600 cubic feet per second.

It has a fall of 1 foot per mile, a bottom width of from 26 to 36 feet and carries 7 feet depth of water. Three flumes will be constructed, of which the shorter one, of 200 feet, is now finished; the two longer ones, of 200 feet and 1200 feet, respectively, and which are cut-offs from the old canal line, will be built soon, the water for the present going around through its old channel. These flumes are 26 feet wide and carry 8 feet of water. Opposite the site for the power plant a very strong system of gates is put in the canal, and a concrete masonry forebay is being built. From this, four lines of 72-inch sheet pipe will lead down to the power house, a distance of 300 feet.

The wheel-pit of the power house is 13x82 feet inside, the power house being 26x82 feet. There will be four 700 H. P. turbines in two pairs.



Each turbine has two discharge or draft tubes, on account of having at times to discharge water at two different levels. The longer tubes discharge into the wheel-pit, from which a tail race leads direct to the Jordan river. The shorter tubes discharge inside the power house into tail races, which lead to two other irrigation canals, one on each side of the river, and about 20 feet higher than the same. During the irrigation season a full supply will have

HON. MOSES HALLETT, Judge of the United States District Court at Denver, who is now in this city, has been in active service upon the bench for thirty-two years. During that period he has passed upon more litigation involving the bonanzas of Western diggings than any jurist in the nation. None have been more prominent in determining the rights of the miner under the law of apex. He presided in the famous Bonnybel - Durant case in the trial of which 110 experts participated, and upon which over $300,000 was expended for testimony and court costs. It was after this avalanche of testimony that almost bewildered the jury, that the court suggested to counsel that it was of the opinion that more intelligent conclusions could be arrived at were more testimony from practical and less from expert sources introduced. The next mining case found the experts reduced to about ten on a side, and with that the decadence of the expert began. Litigants and lawyers suddenly awoke to the fact that the expert was a very expensive article. His compensation ranged $15 to $100 a day, while the more eminent were allowed as much as $250 for each day they were on the witness stand, and then there was the hotel bill that at times reached enormous proportions. This has been, to a very large extent, reformed, however, and to the gentle admonition of Judge Hallett litigants are indebted for a saving of thousands of dollars.—Salt Lake, Utah, Tribune.

IT is reported from Marysville, Cal., that an experiment concluded there by Dr. F. A. C. Perrine of Stanford University, utilizing the electrical power line of the Yuba Power Company from its power house to Browns valley, a distance of ten miles, demonstrated that 36,000 volts may be transmitted over a copper wire, using glass insulation, against 16,000, which has been the maximum in power transmission heretofore. If so, this would effect a considerable saving in the cost of wire in the construction of electrical transmission plants in the future.

LAST Saturday the House Committee on Public Lands agreed to favorably report to the House the war bill relieving holders of mineral claims from the necessary assessments during service in war, and one of similar scope giving homesteaders leave of absence, and, if discharged for service wounds, deducting their full term of enlistment from the required five years' homestead residence.

HEAT continued some length of time throws the carbon in steel out of solution and into the graphitic or uncombined state, and then it will not temper; that is, the hardness is all let down as soon as the temper commences to run.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

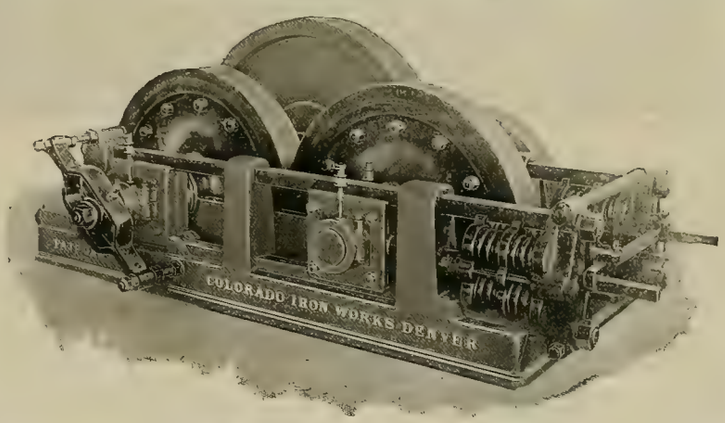
Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. ✦ ENGINEERS AND MANUFACTURERS OF **Ore Milling and Smelting Equipments.**



We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

CYANIDE Highest Known Grade OF CYANOGEN. POTASSIUM.

GUARANTEED 99% and over.

In 112-lb. Zinc Lined Cases.

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT Amalgamator Manufacturing Co.,

DENVER, COLO., U. S. A.

—WORKS:—

Cor. 36th and Wazee Streets, DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant

SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

The Pelton Water Wheel Company

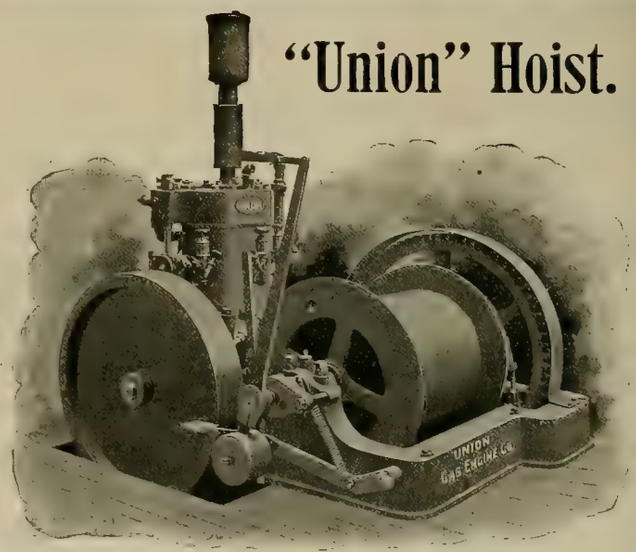
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

In Connection with the Denver & Rio Grande.
For information, address
C. F. ELLIOTT, General Traffic Agent,
DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

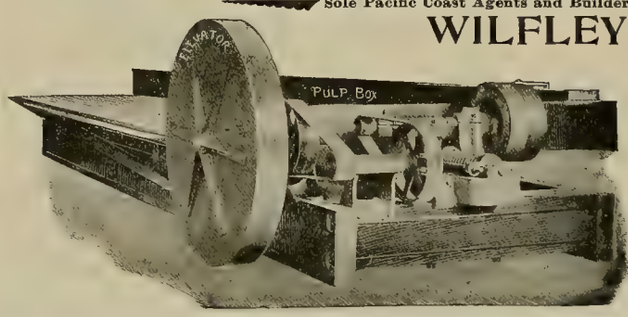
Evans Hydraulic Gravel Elevator,

— MANUFACTURED BY —

THE RISDON IRON & LOCOMOTIVE WORKS,



SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made.
It will do more and better work than any other Gravel Elevator.
It is fully protected by United States and Canadian letters patent.
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

WHITE, ROGERS & CO.,

CONSTRUCTING ENGINEERS and MILLWRIGHTS,
Offices: 306 PINE STREET, - - - - - SAN FRANCISCO, CAL.
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

These Machines are Kept in Stock Ready for Immediate Shipment.

Water Wheels and Motors.

IMPULSE WHEELS OR TURBINES furnished to suit requirements of every case for large Mining Plants, Transmission Lines, Railways, Mills, etc., or in small units for Lathes, Saws, Elevators, etc.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, May 19, 1898.

The war and its attendant local purchases have livened up all lines of trade in provisions and general supplies. Minerals, metallic and non-metallic, have gone ahead. The most noticeable local advance is in quicksilver. It has gone up three times since the 13th, and is now quoted at $42 domestic, $38 and $38.50 export. This week in Boston quicksilver advanced from $41.50 to $42.50 per flask. On the 15th it advanced to $43.50 in London.

The largest quicksilver mines of the world—the Almaden—says the News Bureau, are located in Spain and owned by the Spanish Government, but the Rothschilds control the output as security for loans made to the Spanish Government. The Spanish mines have a production of about 40,000 flasks per year against 30,000 flasks produced in the United States, almost entirely in this State. Foreign quicksilver is not imported, owing to $5 a flask duty and the fact that American producers keep prices sufficiently under the foreign quotations to prevent importations. An advance of $3.50 per flask in quicksilver is of great advantage to local quicksilver interests.

The Napa has an output of 7200 flasks per year, the New Idria 5000 flasks and the Ætna 3600 flasks, a total of 15,800 flasks, and as the companies have no floating debts the advance should accrue directly to the stockholders of the different companies. Stocks of quicksilver in this country are estimated at one-quarter of what they were a year ago.

Copper is also on the up grade; it is quoted locally at 14@16c ingot; sheet 17c.

An early advance is looked for in pig lead. During the civil war prices of pig lead advanced 1½c per lb., but prices have shown no appreciable change during the present war, notwithstanding the fact that pig lead is used extensively in the manufacture of ammunition. New York quotations are $3.62½; sheet lead is quoted here at 6¼@6¾c; pipe, 5½@6.

Tin plate, I. C. coke, full weight, is $4@$4.25 per box. Sheet zinc, by the cask, 600 lb., 7c; spelter, 5c@5¼c; antimony, 10@10½c.

Chemicals show in general an advance. Cyanide of potassium is quoted jobbing 33@33¼c per lb.; carloads, 29½c; sulphuric acid 2c per lb. for 66%; nitric acid, 7½c in carboys; soda ash $1.60 per 100 lbs. 58%; hyphosulphite of soda, 2¾c per lb.; blue vitrol 4¼c per lb.

In powder there is little advance. No one is busier than the powder men, government orders running into the millions. To miners the following prices are quoted, f. o. b. San Francisco: Giant and Safety No. 1, containing 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, mimimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

Fuse, triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

Caps, 3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

J. W. Harrison's coal circular says:

Since the Alameda left there have been the following deliveries from Australia, viz.: Port Logan, 3095 tons; Louisiana, 2010; Ednyfed, 1648; Sonoma, 1556; McNear, 1787; total, 10,096 tons. There are eighteen vessels due here from Sydney and Newcastle within sixty days, with about 44,000 tons of coal, all of which will come to a good market, as our yards have but little on hand. The engaged Australian list for San Francisco foots up fifty-one vessels, with about 135,000 tons coal capacity; some of these will not leave their loading port before October next. Coal freights have been advanced over 2 shillings per ton from Newcastle since last mail; this was fully expected, as shipowners are not disposed to seek this port, when we have so few inducements to offer for outward charters, our incoming wheat crop being a comparative failure. Our importers have benefited but little by the increased rates of freight from Australia, as the cargoes of fully 90 per cent of the vessels chartered were disposed of months ago; hence our consumers are insured cheap fuel. The American navy at Manila will call for considerable coal shortly, a portion of same will be shipped from here, which will serve to sustain values and deplete our stock on hand. The general outlook indicates high prices for coal throughout the entire year, and should prove a banner season for our colliery proprietors in British Columbia and Washington, as our requirements will be nearly all drawn from those sections.

Last year Sisal bale rope was quoted at 5c and Manila at 6c in 10,000-lb lots. This morning the Tubbs Cordage Co. quote three and four-strand Sisal bale rope in 10,000-lb lots at 7¾c and Manila at 8¾c, while two-strand Manila is 9¼c. In smaller lots, ½c per pound more. There is a shortage in the Sisal hemp crop in Central America, and shortage and doubt about the Manila from the Philippines.

New York reports sterling exchange strong, actual business in bankers' bills at $4.86¼@4.86½ for demand and $4.84@4.84¼ for sixty days; posted rates, $4.83½@4.87; commercial bills, $4.82½; silver certificates, 57¼@58c: bar silver, 57@58½c; Mexican dollars, 45¼c.

The Whatcom, Wash., Iron and Steel correspondent says:

The coal industry of the Pacific Coast is beginning to show the effects of the increased demand for naval purposes. Both the Fairhaven and the Blue Canyon mines are doing extensive development work to increase their output. At the former a large new double drum hoist is being placed and preparation made to open a second level below the present tunnel level. At Blue Canyon work is being pushed on double shift, and the company is preparing for a large demand, not alone from government sources, but from commercial enterprises also.

It is regarded here as doubtful whether Great Britain will be able to observe her neutrality regarding coal as a contraband of war. The greater her vigilance, however, the greater will be the increase of the Puget Sound coal product. For example, California bought 1,600,000 tons of coal in 1897. Of this 558,000 tons came from British Columbia, 630,000 tons from the United States, and 412,000 from Australia and Great Britain. Should the foreign supply of coal for California be shut off, San Francisco would be forced to fall back on Puget Sound and the Rocky Mountain coal mines, greatly increasing their market and bringing prosperity to their owners and employes.

Mining Share Market.

SAN FRANCISCO, May 19, 1898.

The market was weak throughout, there being practically nothing doing, the war bulletins attracting more attention than the stock lists, wheat and Eastern stocks absorbing most of the business attention. Silver showed some improvements, being quoted in London to-day at 26½d; New York, 57⅝; local, 57¾.

Recently Declared Mining Dividends.

Elkton, Colorado, 2 cents per share, $20,000; May 20.

Cariboo G. M. & M. Co., British Columbia; payable immediately.

Sacramento, Utah, ½ cent per share, $5000; payable May 30.

Wedge, California, $2500; payable immediately.

Recent California Mining Incorporations.

Alta Con. M. Co., San Francisco; capital stock, $100,000; subscribed $50; W. B. Meckfessel, G. W. Parsons, W. F. Laumeister, A. Cook, S. K. Thornton.

Commercial Paragraphs.

THE Fulton Engineering and Shipbuilding Works will launch the Ruth and Newberry freight steamers next week from their works at Harbor View. Each boat is 160 feet long. They will also launch a stern wheeler of 160 feet length. The same company is placing new machinery in the Chas. Nelson, putting in a triple expansion 900 H. P. engine, electric lighting plant, distilling apparatus, etc. The boat will make her trial trip next week.

THE Jeanesville Iron Works Co., on June 1st, move into their new store, Columbia Hotel Block, 1328 Seventeenth St., Denver, Colo. They will carry a stock of station mine pumps and Cameron pattern sinking pumps and a full line of duplicate parts for repairs.

Assessment Notices.

RED CAP MINING COMPANY. LOCATION of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of April, 1898, an assessment (No 3) of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 125 Beale St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 27th day of June, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. H. MARTIN, Secretary.

Office—125 Beale St., San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of May, 1898, an assessment (No. 1) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 213 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 5th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson St., San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of June, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 23rd day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—No. 916 Market street, Room 57, San Francisco, California.

LEON GOLD MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of $1\frac{1}{2}$ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
